### NEOPLATONISM, THE GREEK COMMENTATORS, AND RENAISSANCE ARISTOTELIANISM

1. We shall treat both Themistius and also Simplicius as sources of Neoplatonic doctrines for the Renaissance Aristotelians. Since various scholars simply deny that Themistius is a Neoplatonist, some comment is in order. He is categorically denied to be a Neoplatonist by Wilhelm Von Christ, Wilhelm Schmid, and Otto Stählin, *Geschichte der Griechischen Literatur*, 6th ed., II, 2 (Munich, 1961), p. 1011: "Denn so viel er den Platon im Mund führt und sein Handeln durch Berufung auf ihn rechtfertigt, so ist er sich doch genau bewusst, dass er eigentlich kein Platoniker, am wenigstens ein Neuplatoniker ist." They do go on, however, to point out that while Themistius is an Aristotelian and wants to be one, he also believed Platonism can be reconciled with Aristotelianism. On the other hand, they point out (p. 1011, n. 8) that although there are Neoplatonic ideas in some of Themistius' orations, the latter also contain criticism of Neoplatonism and an emphasis on a practical, political direction lacking in Neoplatonism. Fritz Schemmel, in his "Die Hochschule von Konstantinopel im IV. Jahrhundert P. Ch. N.," *Neue Jahrbücher für Pädagogik* 22 (1908), pp. 147–168, discusses Themistius' paraphrases of Aristotle, dating their composition between 337 and 355 (pp. 152–155). He emphasizes their pedagogical purpose (p. 157) and the primacy of ethics and practise in Themistius' conception of philosophy (pp. 155 and 160–161). He too denies that Themistius is a Neoplatonist, though he admits that Themistius agrees with the Neoplatonists in the conviction that Plato and Aristotle teach essentially the same thing (p. 155). In like fashion, Eduard Zeller, *Die Philosophie der Griechen in ihrer geschichtlichen Entwicklung*, 5th ed., III, 2 (Leipzig, 1923; repr. Hildesheim, 1963), pp. 799–801, argues that the distinctive traits of Neoplatonism are not prominent in Themistius. Indeed, Themistius himself expressly indicates that he does not approve the innovations of Neoplatonism since these go beyond the older Platonic-Aristotelian philosophy. In turn, Karl Praechter, *Die Philosophie des Altertums*, 12th ed. (Berlin, 1926), pp. 657–658, admits that if Themistius also wrote commentaries on Plato, this would agree with Themistius as a Neoplatonist, but he then emphasizes that Themistius had taken Aristotle as his model. The tendency to reconcile Plato and Aristotle is seen as self-evident in Themistius' day and not limited to Neoplatonism. G. L'aggin sees Themistius as belonging to Aristotelianism, not Platonism, and suggests that if he believed in the doctrinal unity of Platonism and Aristotelianism, he opposed it to the novelties of the Neoplatonists. See his article "Themistio," in *Enciclopedia filosofica*, 2nd ed., VI (Florence, 1967), col. 370–371. Willy Stegemann also follows the view that Themistius was not a Neoplatonist. See his article on Themistius in Paulys-Wissowa, *Real-Encyclopädie der classischen Altertumswissenschaft*, Zweite

Reihe, V (Stuttgart, 1934), col. 1642–1680, at col. 1648–1649. In a recent and important article, H. J. Blumenthal appears to deny or at least to minimize any Neoplatonism in Themistius and in the paraphrases on the *De anima* in particular. In his "Neoplatonic Elements in the *De anima* Commentaries," *Phronesis* 21 (1976), pp. 64–87, he remarks (p. 82) that Neoplatonism was already the dominant philosophy in the time of Themistius, who was "trying to be an Aristotelian." He admits that Themistius did not exclude Platonic or Platonist ideas and then adds (p. 83): "But his orientation was certainly different from that of the Neoplatonists." As to Themistius' comments on *De anima*, III, c. 5, Blumenthal remarks: "The vocabulary is Peripatetic, and the thought shows no signs of the Neoplatonic multiplication of entities: there are no participated and unparticipated transcendent intellects, no distinction between intelligible and intellectual life, no members of triads." Blumenthal does not appear to exclude completely the possible influence of Neoplatonism on Themistius when he refers in his article, "Neoplatonic Interpretations of Aristotle on *Phantasia*," *The Review of Metaphysics* 31 (1977), pp. 242–257, p. 253 to "Themistius, who, if not always a profound interpreter of Aristotle, is to some extent free from the Neoplatonic influences which in his time already dominated Greek philosophy." See also Blumenthal's *Plotinus' Psychology, His Doctrines of the Embodied Soul* (The Hague, 1971), pp. 11–13, nn. 10 and 13, where he indicates specific remarks of Plotinus which Themistius may be discussing. Stuart B. Martin makes no mention of Plotinus or Neoplatonism in his article, "The Nature of the Human Intellect as it is Expounded in Themistius' *Paraphrasis in libros Aristotelis De anima*," in *The Quest for the Absolute*, ed. Frederick J. Adelman, Boston College Studies in Philosophy, I (Boston and The Hague, 1966), pp. 1–21, though he is careful to bring out Themistius' tendency to reconcile Plato and Aristotle (p. 2, n. 3). And while he recognizes that the agent intellect is "both transcendently one and yet immanent in many" and that Themistius tries to account for this by the analogy of light and its source, the sun, Martin concludes that there really is only one agent intellect. His assumptions appear to be that Themistius cannot have it both ways and that analogy is insufficient as an explanation (pp. 14–16 and 20–21).

On the other hand, Pierre Duhem relates Themistius' explication of Aristotle's psychology to Neoplatonism and to Plotinus in particular. See Duhem's *Le système du monde*, IV (Paris, 1916), pp. 379–380, 387, and 395–397. It seems an exaggeration, however, simply to refer to Themistius as a Neoplatonist, as does Johannes Geffcken, *Der Ausgang des griechisch-römischen Heidentums* (Heidelberg, 1920), p. 168. Perhaps the most accurate way to express the situation is to point to those elements in Themistius' paraphrases on the *De anima* which are Neoplatonic without claiming that he is a thoroughgoing Neoplatonist. As Augusto Guzzo and Vittorio Mathieu express the matter: "Nell'interpretazione di Temistio si trovano tracce della concezione neoplatonica, senza tuttavia che egli possa esserne considerato un portavoce fedele." See their joint article, "Intelletto," in *Enciclopedia filosofica*, 2nd ed. III (Florence, 1967), col. 963. See also Paul O. Kristeller's review of Philip Merlan's *Monopsychism, Mysticism, Metacosciousness* (The Hague, 1963), which appeared in *The Journal of Philosophy* 64 (1967), pp. 124–125. Kristeller clearly connects Themistius to Plotinus. One example of Neoplatonic influence appears to be Themistius' conception of a plurality of hierarchically arranged souls in man, each of which serves as "matter" or subject to the soul superior to it. See Themistius, *In libros de anima paraphrasis*, ed. Richard Heinze, *Commentaria in Aristotelem graeca*, V, 3 (Berlin, 1899), p. 100, line 31 to p. 101, line 1. The notion that each level in the hierarchy of being is related to the level immediately above it as matter to form is Plotinian. See Plotinus, *Enneads* II, 4, 3; III, 4, 1; and III, 9, 15. For discussion see A. H. Armstrong, *The Architecture of the Intelligible Universe in the Philosophy of Plotinus* (Cambridge, 1940), pp. 76 and 86. Another apparent example of Neoplatonic influence occurs in Themistius' discussion regarding the question whether the agent intellect is one or many. In a celebrated passage, he says that the intellect that primarily illuminates (πρῶτως ἐλλάμπων) is one, while those that are illuminated and illuminate (ἐλλαμπόμενοι καὶ ἐλλάμποντες) are many, just like light, for while the sun is one, light is in some way divided in regard to the different powers of sight. Themistius underscores that Aristotle compares the intellect to light, while Plato, who makes it similar to the Good, compares it to the sun. He then adds that all of us have our being from this one intellect. See Themistius, *In libros de anima paraphrasis*, ed. R. Heinze, p. 103, lin. 32–39, and p. 100, lin. 31–32 and lin. 35 to p. 101, lin. 1. I suggest that those scholars are

- mistaken who hold that there is something faulty with the text here, arguing that Themistius could not have meant that the agent intellect is one and yet also many. Such a view is put forth by Hans Kurfess, *Zur Geschichte der Erklärung der Aristotelischen Lehre vom sog. NOYΣ ΠΟΙΗΤΙΚΟΣ und ΠΑΘΗΤΙΚΟΣ* (Tübingen, 1911), p. 23, n. 26, who is followed by Philip Merlan, *Monopsychism, Mysticism, Metaconsciousness: Problems in the Neoaristotelian and Neoplatonic Tradition* (The Hague, 1963), p. 50–51, n. 3. Rather than correct the text of Themistius, we might do well to note that Plotinus' *Enneads* contain terminology and ideas that help make sense of Themistius' remarks about the intellect just cited and which seem to indicate the Neoplatonic background of those remarks. Plotinus tells us that the sun, which is a center for the light dependent upon it, serves as a model of the Good (I, 7, 1, 25–26). The act emanating from the One is like the light emanating from the sun. While remaining itself immobile, the One illuminates the intelligible realm (V, 3, 12, 40–45). The One is simply light, whereas *Nous* is illuminated in its very substance by the light which the One provides it. In turn, the Soul is made intelligent by *Nous* (V, 6, 4, 18–22). *Nous* provides light for the Soul just as the One does in regard to *Nous* (VI, 7, 17, 36–37). Soul illuminates because it is always illuminated (II, 9, 2, 17–18). Since it is illuminated and possesses light in an uninterrupted fashion, it gives light to the things that follow after it (II, 9, 3, 1–2; see II, 3, 17, 15–16 and IV, 3, 17, 18–31). Soul is a certain light coming from *Nous*, on which it depends (V, 3, 9, 15–16). There is an illuminating light that shines in Soul and makes it intelligible and like the light that is above it. Soul takes hold of intelligible light, which is an image of the life of *Nous* itself. The life of *Nous* is activity, namely, a first light which primarily illuminates (ἀμψον πρώτως) by itself, a light to itself, at once illuminating and being illuminated (ἀμψον ὁμοῦ καὶ λαμπόμενον), a true intelligible, which both knows and is known (V, 3, 8, 24–40). For discussion regarding Plotinus' use of the metaphor of light and his concept of the higher illuminating the lower, see A. H. Armstrong, "Emanation," *Mind* 46 (1937), pp. 61–66; H. R. Schwyzer, "Plotinos," in *Paulys-Wissowa, Real-Encyclopädie der classischen Altertumswissenschaft*, XXI (Stuttgart, 1951), col. 570; Paul Aubin, "L' 'image' dans l'oeuvre de Plotin," *Recherches de science religieuse* 41 (1953), pp. 351ff. and n. 6; Joseph Moreau, "L'idée d'univers dans la pensée antique," *Giornale di metafisica* 8 (1953), pp. 332–334 and 337; *idem*, "L'un et les êtres selon Plotin," *Giornale di metafisica* 11 (1956), pp. 218 and 221–222; *idem*, *Plotin ou la gloire de la philosophie antique* (Paris, 1970), pp. 92–95; Émile Brehier, *The Philosophy of Plotinus*, trans. Joseph Thomas (Chicago, 1958), pp. 48, 96–97 and 114–115; Werner Beierwaltes, "Die Metaphysik des Lichtes in der Philosophie Plotins," *Zeitschrift für philosophische Forschung* 15 (1961), pp. 334–362; Cleto Carbonara, *La filosofia di Plotino*, 3rd ed. (Naples, 1964), pp. 318–320; J. M. Rist, *Plotinus: The Road to Reality* (Cambridge, 1967), pp. 68, 72–73, 96, 114–117 and 197; John H. Fielder, "Chorismos and Emanation in the Philosophy of Plotinus," in *The Significance of Neoplatonism*, ed. R. Baine Harris, *Studies in Neoplatonism: Ancient and Modern*, I (Norfolk and Albany, 1976), pp. 106–115. The significance of the higher illuminating the lower within the individual soul is brought out by Blumenthal, "Neoplatonic Elements," pp. 68–69. However, Blumenthal himself in a recent article, "Themistius, the Last Peripatetic Commentator on Aristotle?" in *Arktouros: Hellenic Studies Presented to Bernard M. W. Knox*, eds. G. W. Bowersock, W. Burkert, and M. C. J. Putnam (Berlin and New York, 1979), pp. 391–400, especially pp. 396–398, seems to exclude any Platonic or Neoplatonic influence on Themistius' doctrine regarding the unity of the agent intellect. I am indebted to Professor Kristeller for having pointed out to me many years ago the apparent Neoplatonic aspects of Themistius' remarks about whether the agent intellect is one or many.
2. Paul of Venice, *Scriptum super librum de anima* (Venice, 1481). For discussion see Felice Momigliano, *Paolo Veneto e le correnti del pensiero religioso e filosofico nel suo tempo* (Turin, 1907); Bruno Nardi, *Saggi sull'aristotelismo padovano dal secolo XIV al XVI* (Florence, 1958), pp. 75–93; Eugenio Garin, *Storia della filosofia italiana* (Turin, 1966), pp. 436–446; Alan R. Perreiah, "A Biographical Introduction to Paul of Venice," *Augustiniana* 17 (1967), pp. 450–461.
  3. Cajetan of Thiene, *Super libros de anima* (Venice, 1493). The basic study on Thiene remains Silvestro da Valsanzibio, *Vita e dottrina di Gaetano di Thiene filosofo dello Studio di Padova (1387–1465)* (Padua, 1949). There is a copy of the first edition of Thiene's *De anima* (Padua, 1475; Hain 15502) in the Biblioteca Universitaria at Padua which contains notations apparently in more than one hand. However, many of these notations are clearly in the hand of Nicoletto Vernia. The shelf-mark of this volume is Sec. XV. 724. I identified this volume as belonging to Vernia in June, 1973.
  4. On Vernia see Pietro Ragnisco, *Nicoletto Vernia: Studi storici sulla filosofia padovana nella seconda metà del secolo decimoquinto* (Venice, 1891); Nardi, *Saggi*, pp. 95–126; Paolo Sambin, "Intorno a Nicoletto Vernia," *Rinascimento* 3 (1952), pp. 261–268; Garin, *Storia della filosofia italiana*, pp. 450–454; *idem*, *La cultura filosofica del Rinascimento italiano* (Florence, 1961), pp. 293–299; Cesare Vasoli, "La scienza della natura in Nicoletto Vernia," in *La filosofia della natura nel medioevo* (Milan, 1966), pp. 717–729.
  5. On Nifo see Pasquale Tuozzi, "Agostino Nifo e le sue opere," *Atti e memorie della R. Accademia di scienze, lettere ed Arti* (Padua), n. s. 20 (1904), p. 63–86; Giuseppe Tommasino, *Tra umanisti e filosofi* (Maddaloni, 1921), I, 123–147; Nardi *Saggi*, *passim*; *idem*, *Sigieri di Brabante nel pensiero del Rinascimento italiano* (Rome, 1945), *passim*; Garin, *Storia della filosofia italiana*, pp. 523–527, 535–538 and 572–573; *idem*, *La cultura filosofica*, pp. 114–118 and 295–303; Etienne Gilson, "Autour de Pomponazzi, Problématique de l'immortalité de l'âme en Italie au début du XVI<sup>e</sup> siècle," *Archives d'histoire doctrinale et littéraire du moyen âge* 28 (1961), pp. 236–253; William A. Wallace, *Causality and Scientific Explanation, I: Medieval and Early Classical Science* (Ann Arbor, 1972), pp. 139–153; Edward P. Mahoney, "A Note on Agostino Nifo," *Philological Quarterly* 50 (1971), pp. 125–132; *idem*, "Agostino Nifo," *Dictionary of Scientific Biography*, X (New York, 1974), pp. 125–132; *idem*, "Agostino Nifo's Early Views on Immortality," *Journal of the History of Philosophy* 8 (1970), pp. 451–460; *idem*, "Agostino Nifo's *De sensu agente*," *Archiv für Geschichte der Philosophie* 53 (1971), pp. 119–142; *idem*, "Antonio Trombetta and Agostino Nifo on Averroes and Intelligible Species: A Philosophical Dispute at the University of Padua," in *Storia e cultura nel Convento del Santo a Padova*, ed. Antonino Poppi (Vicenza, 1976), pp. 289–301; Antonino Poppi, *Introduzione all'aristotelismo padovano* (Padua, 1970), *passim*. Nifo is presented from other points of view in three recent and interesting articles. See Paola Zambelli, "I problemi metodologici del necromante Agostino Nifo," *Medioevo* 1 (1975), pp. 129–171; E. J. Ashworth, "Agostino Nifo's Reinterpretation of Medieval Logic," *Rivista critica di storia della filosofia* 31 (1976), pp. 354–374; Lisa Jardine, "Galileo's Road to Truth and the Demonstrative Regress," *Studies in History and Philosophy of Science* 7 (1976), pp. 277–318, especially pp. 290–295. Jardine brings out well the impact of the Greek Commentators, especially Themistius, in her discussion. What is surprising is that she does not mention Wallace's treatment of Nifo cited above. Nifo's interest in Themistius and Simplicius is noted in another context by Paolo Galluzzi, *Momento: Studi galileiani* (Rome, 1979), pp. 138–143. The only secondary literature on Nifo that he appears to cite is Zambelli's article just mentioned. However, he does state (p. 142, n. 105) that she has argued effectively against the thesis of Nifo's noteworthy philological competence supposedly sustained by Wilhelm Risse, F. Edward Cranz, Charles B. Schmitt, and myself. Although I have, on more than one occasion, drawn attention to the significance of Nifo's deliberately learning Greek, I am unaware that I have given him any grades for his ability at the language. Moreover, that he may have lightly revised an already existent translation does not appear to be unique to him (p. 94, 122–123) nor that he misunderstood a passage in Aristotle (p. 142). Galluzzi is to be praised, however, for presenting sections on the views of the Greek Commentators, notably, Themistius, Simplicius, and Philoponus (pp. 98–106 and 125–134), and for admitting the drawbacks of Ermolao's translation of Themistius (p. 98).
  6. Themistius, *Paraphrasis in Aristotelem*, trans. Ermolao Barbaro (Treviso, 1481). See Hain \*15463. I have examined copies of this edition at the Newberry Library, Chicago, and at the Beinecke Library, Yale University. This translation was reprinted on several occasions in the sixteenth century. For discussion see Arnaldo Ferriguto, *Almorò Barbaro, l'alta cultura del settrione d'Italia nel '400* *Miscellanea di Storia Veneta*, 3rd ser., XV (Venice, 1922), pp. 133–150. A new translation of the paraphrases on *De anima* III was made by Ludovico Nogarola and published as a supplement to a printing of Ermolao's translation. See *Themistii peripatetici lucidissimi Paraphrasis in Aristotelis Posteriora . . . Hermolao Barbaro patricio Veneto interprete . . .* (Venice, 1554), pp. 104–119. See p. 103 for the dedicatory letter to Cardinal Giulio da Montefeltro-Della Rovere in which Nogarola criticizes Ermolao's translation. I have examined ■

copy of this edition at the Biblioteca Vallicelliana, Rome. Yet another translation of the third book of Themistius' paraphrases on the *De anima* was made by Federico Bonaventura and published as the second volume of his *Opuscula* (Urbino, 1627). See *Themistii Euphradae Paraphrasis in tertium librum Aristotelis De anima Federico Bonaventura Urbinate interprete* (Urbino, 1627), pp. 10–11 for an attack on Ermolao and Nogarola as translators. I have examined a copy of this work at the Bibliothèque Nationale, Paris. See also Nardi, *Saggi*, pp. 365–368. Vernia's own copy of the 1481 edition of Ermolao's translation of Themistius is today in the Biblioteca Universitaria at Padua. I identified this volume in July, 1973. It bears the shelf-mark Sec. XV. 96 and contains a statement on sig. ii7v that it had been his. The marginal notations are without doubt in his hand. I discovered another copy of the 1481 edition of Ermolao's translation in the Biblioteca San Marco Marciana, Venice, which also appears to have marginal annotations in Vernia's hand. It has the shelf-mark Inc. 447 and is bound with Inc. 448, which is a copy of Thomas Aquinas' *De unitate intellectus* (Treviso, 1476). The latter contains many marginal annotations that are clearly in Vernia's hand. Vernia was already citing Ermolao's translation in his preface regarding the *Physics* and in *Quaestio est, an medicina nobilior atque praestantior sit iure civili*, both of which are to be found in Vernia's edition of Walter Burley, *Super octo libros physicorum* (Venice, 1482). In the preface (sig. A2rb), Vernia praises Ermolao for his translation. See also sig. A3rb and A4rb for other references to Themistius. The question on medicine and law has been edited and republished by Eugenio Garin in *La disputa delle arti nel quattrocento* (Florence, 1947), pp. 111–123.

There are allusions to Themistius and also to Simplicius in the marginal annotations that Vernia made in his copy of John of Jandun, *Quaestiones super tres libros de anima* (Venice, 1473; Hain 7458). I discovered this volume at the Biblioteca Universitaria, Padua, in July 1974. It carries the shelf-mark Sec. XV. 717. Vernia himself indicates at the end of Book II (f. 48rb) that he had completed Book II on August 6, 1487. A few folios later (bottom margin of f. 51v) there is a long annotation in which he dismisses Scotus for saying Aristotle was in doubt whether the soul is bodily. He goes on to cite Averroes as saying that while the intellect remains after death, it has no memory. He then adds that Themistius and Simplicius expound the text in the same way. In another annotation (left margin of f. 74v), he addresses Jandun, telling him that he has not understood Aristotle's *Posterior Analytics* because he has not seen the *Doctor lucidus*, that is, Themistius. There is also a copy of Jandun's *Quaestiones in libros physicorum Aristotelis* (Venice, 1488; Hain 7457) in the same library which once belonged to Vernia. Its shelf mark is Sec. XV. 665. I identified this volume in June, 1972. My attention was called to the existence of Vernia's copies of Jandun's *Physics* and Themistius' paraphrases in the Biblioteca Universitaria at Padua by a remark of Ragnisco, Nicoletto Vernia, p. 35 (= p. 625), n. 1.

In his lectures on Aristotle's *Posterior Analytics*, which are to be found in Bodleian Library, Oxford, Canonici Miscell. Latini Cod. 506, ff. 224r–241r, Vernia makes constant reference to Themistius. At one point he tells his students: "Nemo enim fuit doctior illo, proinde adorate verba Themistii" (f. 234). Much from these lectures reappears to the word in Vernia's treatise against Averroes, cited in the following note 7. That a conciliating approach to Aristotle and Plato was taught at Padua is, of course, not in itself a surprise. That it was taught by Vernia is. I am editing this work for future publication.

7. See Nicoletto Vernia, *Contra perversum Averrois opinionem de unitate intellectus et de animae felicitate* (Venice, 1505), which was also reprinted in *Acutissimae quaestiones super libros de physica auscultatione ab Alberto de Saxonia editae* (Venice, 1516), ff. 83r–91rb. The first edition appeared in the Venice 1504 printing of Albert of Saxony's *Physics*, ff. 84ra–92rb. I have examined a copy of the first edition in the Biblioteca Nazionale Vittorio Emanuele, Rome. I shall cite the 1505 and 1516 editions in the present paper. For Vernia's references to Simplicius' *Physics*, see f. 5ra (1516 ed.; ff. 85vb–86ra), f. 9ra (f. 89ra), f. 10vab (f. 90rb–90va); for Simplicius' *De coelo*, see f. 4ra (f. 85ra); and for his *De anima*, see f. 4vb (f. 85va). There is discussion regarding the second of these commentaries in D. J. Allen, "Mediaeval Versions of Aristotle, *De caelo*, and of the Commentary of Simplicius," *Mediaeval and Renaissance Studies* 2 (1950), pp. 82–120. Vernia refers to Simplicius' *De anima* several times in his *Proemium in libro*

*de anima*, Bodleian Library, Oxford, Canonici Miscell. Latini Cod. 506, ff. 319r, 321r, 321v. There are also several references to Themistius' *De anima* in this work.

The classic study on Simplicius' influence on late fifteenth- and sixteenth-century philosophy in Italy is Bruno Nardi's fine essay, "Il commento di Simplicio al *De anima* nelle controversie della fine del secolo XV e del secolo XVI," which was reprinted in his *Saggi*, pp. 365–442. Regrettably, Nardi nowhere discusses Vernia in his essay. On the other hand, he draws attention to the fact that Giovanni Pico della Mirandola had a copy of Simplicius' *De anima* in his library and also to the fact that he lists basic theses of Simplicius' own psychology in his "conclusiones." See Giovanni Pico della Mirandola, *Conclusiones sive theses DCCCC Romae anno 1486 publice disputandae, sed non admixtae*, ed. Bohdan Kieszowski (Geneva, 1973), p. 39, and Pearl Kibre, *The Library of Pico della Mirandola* (New York, 1936), pp. 29 and 179 (entry 447). For discussion see Garin, *Storia della filosofia italiana*, pp. 463–464 and 470–471; Paul Oskar Kristeller, "Giovanni Pico della Mirandola and His Sources," in *L'opera e il pensiero di Giovanni Pico della Mirandola nella storia dell'umanesimo*, Convegno internazionale (Mirandola: 15–18 Settembre 1963), 1 (Florence, 1965), pp. 54–55 and 62; Giovanni Di Napoli, *Giovanni Pico della Mirandola e la problematica dottrinale del suo tempo* (Rome, 1965), pp. 87, 125 and 218. The latter two scholars bring out in particular the connection between Pico's conciliation of Plato and Aristotle and his interest in Simplicius. There are also references to Simplicius in Pico's oration on the dignity of man. See Pico della Mirandola, *De hominis dignitate*, ed. Eugenio Garin, Edizione Nazionale dei Classici del Pensiero Italiano, 1 (Florence, 1942), pp. 140 and 144. In the latter text he mentions Simplicius along with Boethius as predecessors who proposed to show the conciliation of Plato and Aristotle but did not live up to their promises. However, it should be added that it is regrettable that modern historians have contrasted the interest in Neoplatonism and the conciliation of Plato and Aristotle to be found in Pico with the supposedly rigid Averroism of Vernia. The latter's own interests in Simplicius have been wholly overlooked, as have his attempts to conciliate Plato and Aristotle. Vernia is presented as a strict Averroist by Bohdan Kieszowski, *Studi sul platonismo del Rinascimento in Italia* (Florence, 1936), pp. 138–143, and Tullio Gregory, "Aristotelismo," in *Grande antologia filosofica*, VI, ed. M. F. Sciacca (Milan, 1964), p. 614.

The attribution of the *De anima* traditionally ascribed to Simplicius has been challenged by two recent scholars, F. Bossier and C. Steel, in their article, "Priscianus Lydus on de *In de anima* van Pseudo(?)-Simplicius," *Tijdschrift voor Filosofie* 34 (1972), pp. 761–821 (French summary: pp. 821–822). Their thesis that the work is in fact by Priscianus Lydus and not Simplicius has been submitted to a critical but sympathetic analysis by Ilsetraut Hadot in her book, *Le problème du néoplatonisme Alexandrin: Hiéroclès et Simplicius* (Paris, 1978), pp. 193–202. While she appears to grant their thesis probability, she calls on them to remove all doubts by a more detailed examination of the style of Priscianus. One of the authors has returned to the thesis in a book which he has authored by himself. See now Carlos G. Steel, *The Changing Self, A Study on the Soul in Later Neoplatonism: Iamblichus, Damascius and Priscianus*, Verhandelingen van de Koninklijke Academie voor Wetenschappen, Letteren en Schone Kunsten van België, Klasse der Letteren, Jaargang XL, Nr. 85 (Brussels, 1978), p. 7–11 and 123–154. In the present paper, I shall continue to refer to this *De anima* commentary as Simplicius' and I do so simply for the sake of convenience. However, I do not intend to question the plausibility of the thesis of Bossier and Steel. For useful summaries of the doctrine of this *De anima* commentary, see A. Ed. Chaignet, *Histoire de la psychologie des grecs*, V (Paris, 1893), pp. 357–375; O. Hamelin, *La théorie de l'intellect d'après Aristote et ses commentateurs*, ed. Edmond Barbotin (Paris, 1953), pp. 44–57. I very much regret that Steel's book became available to me only as I was completing the notes for this article. Given the theme of the present paper, it is interesting to note that Simplicius' authorship of the *De anima* commentary had already been questioned in the Renaissance and the possibility of Priscianus Lydus being the true author had been proposed. See Nardi, *Saggi*, pp. 431–432, who draws attention to a discussion in Francesco Piccolomini. See the latter's "Capita sententiae Simplicii ex commentariis librorum de anima depropterea," in his *In tres libros Aristotelis de anima lucidissima expositio* (Venice, 1602), f. 216r. I have examined a copy of this work

- in the Biblioteca Nazionale Vittorio Emanuele at Rome. Bossier and Steel pay credit (p. 762) to their Renaissance forerunner. On the dating of the commentaries regarded by all as genuinely Simplician, namely, those on the *De caelo* and *Physics*, see Alan Cameron, "The Last Days of the Academy at Athens," *Proceedings of the Cambridge Philological Society* 195 (1969), pp. 7–30, at pp. 22–24.
8. *Alexandri Aphrodisiei enarratio de anima ex Aristotelis institutione interprete Hieronymo Donato patritio veneto* (Brescia, 1495). See GKW, #859. For discussion of Alexander and his influence in the Renaissance see F. Edward Cranz, "Alexander Aphrodisiensis," in *Catalogus Translationum et Commentariorum: Mediaeval and Renaissance Latin Translations and Commentaries I*, ed. P. O. Kristeller (Washington, D.C., 1960), pp. 77–135, especially pp. 85–86 and 111–112; *idem*, "Alexander Aphrodisiensis: Addenda et corrigenda," in *Catalogus Translationum et Commentariorum*, . . . II, eds. P. O. Kristeller and F. E. Cranz (Washington, D.C., 1971), pp. 411–422, especially pp. 417–418; Nardi, *Saggi*, pp. 369–372 and *passim*; P. O. Kristeller, *Renaissance Thought II: Papers on Humanism and the Arts* (New York, 1965), pp. 111–118; E. P. Mahoney, "Nicoletto Vernia and Agostino Nifo on Alexander of Aphrodisias: An Unnoticed Dispute," *Rivista critica di storia della filosofia* 23 (1968), pp. 268–296.
  9. See Martin Grabmann, *Mittelalterliche lateinische Übersetzungen von Schriften der Aristoteles-Kommentatoren Johannes Philoponos, Alexander von Aphrodisias und Themistios*, Sitzungsberichte der Bayerischen Akademie der Wissenschaften, Philosophisch-historische Abteilung, 1929, heft 7, pp. 63–68; Marcel de Corte, "Thémistius et Saint Thomas d'Aquin," *Archives d'histoire doctrinale et littéraire du moyen âge* 8 (1932), pp. 47–83, especially pp. 65–83; G. Verbeke, introduction to *Thémistius, Commentaire sur le traité de l'âme d'Aristote*, *Traduction de Guillaume de Moerbeke*, *Corpus Latinum Commentariorum in Aristotelem Graecorum*, I (Louvain and Paris, 1957), pp. ix–lxii; E. P. Mahoney, "Themistius and the Agent Intellect in James of Viterbo and Other Thirteenth Century Philosophers (Saint Thomas, Siger of Brabant, and Henry Bate)," *Augustiniana* 23 (1963), pp. 422–467. For an analysis of Moerbeke as a translator, see Gérard Verbeke, "Guillaume de Moerbeke et sa méthode de traduction," in *Medioevo e Rinascimento, Studi in onore di Bruno Nardi II* (Florence, 1955), pp. 779–800. See also Verbeke's "Guillaume de Moerbeke, traducteur de Jean Philopon," *Revue philosophique de Louvain* 49 (1951), pp. 222–235. For scholarly literature on Moerbeke as a translator of Proclus, see below note 56. It must be added that Verbeke's remarks on the influence of Themistius on Thomas have been challenged by C. Vansteenkiste in his review of Verbeke's edition. See Vansteenkiste's review in *Revue d'histoire ecclésiastique* 53 (1958), pp. 514–526, especially pp. 524–526. However, he does not appear to question that influence in regard to Thomas' *De unitate intellectus*.
  10. "Utrum anima intellectiva humano corpore unita tamquam vera forma substantialis dñs ei esse specificum substantiale aeterna atque unica sit in omnibus hominibus," (Biblioteca Nazionale San Marco [Marciana], Venice, Cod. Lat. VI. 105 [= 2656], ff. 156ra–160va). I have prepared an edition of this treatise that will be published by Editrice Antenore, Padua under the title *Nicoletto Vernia's Early Treatise on the Intellective Soul: Introduction and Critical Text*. Vernia's authorship of this treatise has been established by a carefully documented and well-argued essay of Giulio F. Pagallo, "Sull'autore (Nicoletto Vernia?) di un'anonima e inedita quaestio sull'anima del secolo XV," in *La filosofia della natura nel medioevo* (Milan, 1966), pp. 670–682.
  11. See my study, "Nicoletto Vernia on the Soul and Immortality," in *Philosophy and Humanism: Renaissance Essays in Honor of Paul Oskar Kristeller* (New York and Leiden, 1976), pp. 144–163. On Vernia's "Albertism," see my essay, "Albert the Great and the Studio Patavino in the Late Fifteenth and Early Sixteenth Centuries," in *Albertus Magnus and the Sciences: Commemorative Essays 1980*, ed. James A. Weisheipl (Toronto, 1980), pp. 537–563.
  12. Vernia, *Contra perversam Averrois opinionem*, f. 4rb–4va (f. 85rb). For identification of Vernia's sources in Albert, see my article, "Nicoletto Vernia on the Soul," p. 151. Cf. Leopold Gaul, *Alberts des Grossen Verhältnis zu Plato*, Beiträge zur Geschichte der Philosophie des Mittelalters, XII, 1 (Münster, 1913), pp. 12–21; Pierre Michaud-Quantin, "Les 'Platonici' dans la psychologie de S. Albert le Grand," *Recherches de théologie ancienne et médiévale* 23 (1956), pp. 194–207, especially pp. 198–201 and 204–206.
  13. *Ibid.*, f. 6ra (f. 87ra). See also f. 8rb (f. 88va).
  14. *Ibid.*, f. 5va (f. 86rb). Vernia adds arguments from the discussion in Plotinus' *Enneads* IV, 9, regarding the question whether all souls are one.
  15. *Ibid.*, f. 10vb (f. 90va).
  16. Themistius, *In libros de anima paraphrasis*, ed. R. Heinze, p. 103, lin. 32–36. For the literature on the debate regarding this passage in the late thirteenth century, see note 9 above. The Neoplatonic aspects of the passage were discussed in note 1 above.
  17. "Hoc idem in capitulo 32 ubi solvendo quaestionem an plures sint agentes intellectus inquit an intellectum illustrantem unum oportet esse, illustratos vero plures, sicut unus sol, et tamen lumen divellitur" (Vernia, *Contra perversam Averrois opinionem*, f. 9ra [f. 89rb]). See Themistius, *Paraphrasis de anima* III, c. 32, in *Paraphrasis in Aristotelem*, trans. Ermolao Barbaro, sig. ff2v, lin. 28–30: "An primum quidem intellectum illuminantem credi unum oportet. Illuminatos vero et subindeo illuminantes multos, quemadmodum quamquam sol est unus, tamen lux quae de sole prodit et mittitur quasi abiungitur ab eo et divellitur atque ita in multos obitus distrahitur distribuiturque." It is noteworthy that Vernia refers to the many intellects only as "illuminated" and not also as "illuminating." He does not integrate this passage very well with his overall presentation of Themistius. The single illuminating intellect is not further identified.
  18. *Ibid.*, f. 6va (f. 87rb) and f. 7ra (f. 87va). Vernia denies that Themistius intended to say that Aristotle condemned Plato regarding reminiscence. The text in question is Themistius, *Analyticorum posteriorum paraphrasis*, ed. Maximilian Wallies, *Commentaria in Aristotelem graeca*, V, 1 (Berlin, 1900), I, c. 1, p. 4, lin. 27–32. See Themistius, *Paraphrasis in posteriora analytica*, I, c. 3, in *Paraphrasis in Aristotelem*, trans. Ermolao Barbaro, sig. A4r, lin. 30–34.
  19. On Vernia's use of Simplicius' *Physics* to defend his extraordinary claim that Alexander of Aphrodisias held to human immortality, see my article, "Nicoletto Vernia and Agostino Nifo," pp. 276–277 and note 34.
  20. For a contrast between Simplicius' *Physics* and the *De anima* traditionally attributed to him, see Bossier and Steel, *op. cit.*, pp. 798–815. But see also the comments by I. Hadot, *Le problème*, pp. 196–199. Vernia's difficulty in reconciling the two commentaries may be a persuasive argument in favor of the Bossier-Steel thesis.
  21. Vernia, *Contra perversam Averrois opinionem*, f. 5ra (f. 85vb). See Simplicius, *In Aristotelis physicorum libros quattuor posteriores commentaria*, ed. Hermann Diels, *Commentaria in Aristotelem graeca*, X (Berlin, 1895), VIII, p. 1249, lin. 30 to p. 1250, lin. 4. Vernia does not give a wholly accurate report of what Simplicius says.
  22. *Ibid.*, f. 5ra (f. 85vb) and f. 9ra (f. 88ra). See Simplicius, *In Aristotelis physicorum libros quattuor posteriores commentaria*, V, p. 965, lin. 29–30. See also Vernia, f. 10va (f. 90rb).
  23. Vernia, *Contra perversam Averrois opinionem*, f. 7rab (f. 87vb). This discussion is also to be found in Vernia's lectures on the *Posterior Analytics*, f. 240v. If it is in fact based on the *De anima* attributed to Simplicius, it is a roughly accurate presentation of some of its doctrines. We can give here only a few remarks to indicate how Vernia agrees with the text. All references will be to Simplicius, *In libros Aristotelis de anima commentaria*, ed. Michael Hayduck, *Commentaria in Aristotelem graeca*, XI (Berlin, 1882). The intellect in us is divided into the theoretic and practical intellects (p. 5, lin. 6–8; p. 61, lin. 11–13). The former is divided into the actual and the potential intellects—distinct "faculties" are not involved but the one soul as operating in various ways (p. 223, lin. 28–33). The potential intellect is the intellect as it proceeds forth to the outside, turning as a whole to the sensibles and in no way perceiving the intelligible forms that are apprehended by the actual intellect. It is then imperfect. However, when it turns away from sensation back within itself and is united with the actual intellect, it is perfected by the intelligible forms and is thus the perfect or habitual intellect. These forms are within the soul and bring about the perfecting of the potential intellect (p. 229, lin. 3–14). The intelligible forms are within, and it is from these forms as from causes that the intellect knows lower things (p. 124, lin. 28–30). That is to say, our intellect can sometimes operate along with sensation and so attend to sensibles, but it can also operate alone by itself and grasp inferior things from their causes, since it can know the very essences of physical forms (p. 276, lin. 16–27). Sense and imagination are aware of the accidental, not the substantial or essential (p. 277, lin. 34–37). Judgment, self-consciousness and comprehension of the intelligible forms are all reserved to the intellect as it operates independently

- of the body (p. 46, lin. 8–9; p. 124, lin. 28–30; p. 196, lin. 16–20; p. 203, lin. 35–36; p. 218, lin. 36–39; p. 223, lin. 33–34; p. 264, lin. 26–27; p. 277, pp. 29–30; p. 279, lin. 26–29; p. 281, lin. 29–30; p. 321, lin. 28). Besides the potential intellect and the habitual intellect there is also in the soul the active intellect, which Aristotle compares to light and habit (p. 223, lin. 9–11). The actual intellect turns into itself and is in no way in potentiality (p. 228, lin. 6–7). It draws its actuality into the unity and permanence within itself (p. 5, lin. 14–15). This intellect abides wholly in itself and unlike the potential intellect is united to higher beings, namely, the intellect above it which perfects it. In turn, the active intellect perfects the potential intellect (p. 243, lin. 21–26 and 34–35).
24. "Istum etiam triplicem modum operandi animae habes a Proculo propositione tertia de causis et decimaquinta. In tertia: 'Omnis anima nobilis triplices habet operationes, animale, intellectivam et divinam.' In decimaquinta: 'Omnis sciens qui scit essentiam est rediens ad eam reditione completa'" (*Ibid.*, f. 7rb [f. 87vb]). The numbering of propositions agrees with that found in Saint Thomas Aquinas, *Super librum de causis expositio*, ed. H. D. Saffrey (Fribourg and Louvain, 1954), p. 17 and p. 88. Perhaps Vernia is simply following his own understanding of Thomas' remark that the *Liber de causis* was excerpted by some Arab philosopher from the *Elements of Theology* by Proclus. See the *Proemium* in Saffrey's edition, p. 3. For scholarly literature on the *Liber de causis* and Proclus' *Elements*, see note 56 below.
  25. Above the human soul and its intellect there are two separated intellects that are distinguished according as to whether or not human intellects participate in them. Simplicius refers to them respectively as the unparticipated intellect and the participated intellect. See Simplicius, *In libros Aristotelis de anima commentarius*, p. 49, lin. 37 to p. 50, lin. 1, and p. 245, 38 to p. 246, lin. 1. For discussion regarding the two intellects above the human soul and intellect, see Chagniet, *Histoire de la psychologie des grecs*, V, p. 364; Kurfess, *Zur Geschichte*, p. 32; Steel, *The Changing Self*, pp. 123–132.
  26. *Destructiones destructionum Averrois cum Augustini Niphi de Suessa expositione* (Venice, 1497). XIII, dub. 4, f. 112ra and f. 115va; XIV, dub. 1, ff. 119ra, 120ra, 121rb and 121vb–122ra. There is perfect agreement between Nifo's citation at XIII, dub. 4, f. 115va of Plotinus, *Enneads* II, 2, 1 and Marsilio Ficino's translation. Nifo even quotes the chapter title.
  27. See I, dub. 11, f. 13vab; VII, dub. 3, f. 87rb; X, dub. 3, f. 103va for references to Simplicius' *De coelo*. His *Physics* is mentioned at VIII, dub. 1, f. 92vab and X, dub. 2, f. 101vb.
  28. The first edition is *Augustini Niphi super tres libros de anima* (Venice, 1503). For the sake of convenience, we shall cite the later edition: *Suessanus super libros de anima: Augustini Niphi Medices philosophi suessani. Collectanea ac commentaria in libros de anima* (Venice, 1522). See II, coll. 37, ff. 93vb–94ra. See Themistius, *In libros Aristotelis de anima paraphrasis*, ed. R. Heinze, *Commentaria in Aristotelem graeca*, V, 3 (Berlin, 1899), p. 25, lin. 35 to p. 27, lin. 7. For Ermolao's translation, see Themistius, *Paraphrasis de anima*, I, c. 23, in *Paraphrasis in Aristotelem*, sig. bb2v, lin. 7–50.
  29. See Marsilio Ficino, *Argumentum to Ennead I*, I, c. 1, 7 and 8 in his *Opera omnia* (Basel, 1576), pp. 1548–1549 and 1551–1552. See *Opera Plotini*, trans. M. Ficino (Florence, 1492), ff. 11–12 and 14–14v. On one occasion Nifo compares the Plotinus who emerges from Ficino's commentary to the position of Averroes. He inquires whether they both believe man is always united by cognition with higher beings. See Nifo, *In libros de anima*, III, comm. 36, ff. 61vb–62ra. Nifo is obviously dependent on Ficino. See Ficino, *Argumentum to Ennead I*, I, c. 11, in *Opera omnia*, p. 1553 (*Opera Plotini*, f. 15r–15v). See the relevant remarks of Eugenio Garin, *La cultura filosofica del Rinascimento italiano* (Florence, 1961), p. 118.
  30. Nifo, *In libros de anima*, II, text. comm. 11, f. 66ra; comm. 21, f. 76va; comm. 26, f. 80rb; III, text. comm. 6, f. 26rb–26va. See Simplicius, *In libros Aristotelis de anima commentaria*, ed. Michael Hayduck, *Commentaria in Aristotelem graeca*, XI (Berlin, 1882), p. 94, lin. 28 to p. 95, lin. 7; p. 102, lin. 12 to p. 103, lin. 8; p. 105, lines 6–13; p. 227, lin. 6–17. Nifo's presentation of Simplicius in *In libros de anima*, text. comm. 19, f. 40rb omits all reference to the notion of "lives" found in the text in question. (See Simplicius, p. 243, lin. 10–32.) On the other hand, when he refers to "lives" in *In libros de anima*, III, text. coll. 1, f. 1va, he assumes incorrectly that the vegetative and sensitive parts form but one life for Simplicius. On Simplicius' doctrine of "lives," see Chagniet, *Histoire de la psychologie des grecs*, V, pp. 362–363. Limits of this essay prevent us from analyzing passages from the *De anima* attributed to Simplicius relating to "lives."
  31. Nifo, *In libros de anima*, III, text. comm. 19, f. 40rb. However, he appears to take the third intellect to be one for all men when in fact Simplicius held that the third intellect was individual in each man's soul. Nifo's Averroist leanings at this point in his career may have led him to misread Simplicius. See Simplicius, p. 254, lin. 31–35 and 258, lin. 14–17. For discussion regarding the three levels of intellect according to Simplicius, see Chagniet, *Histoire de la psychologie des grecs*, V, pp. 364–370. Although Nifo was later attacked by such philosophers as Marcantonio Genua and Federico Pendasio for having misunderstood Simplicius, his interpretation regarding the unity of the intellect was widely accepted. Bruno Nardi points out that Flaminio Nobili, Francesco Piccolomini, Giacomo Zabarella, and even Genua himself believed that Simplicius held to one intellect for all men. See Nardi, *Saggi*, pp. 389, n. 52, 416–417, 420, 435–437 and 452. Even Nardi himself seems to believe that there is only one intellect for all men according to Simplicius (p. 450). Nifo also presents his interpretation of Simplicius' three levels of intellect in his *Liber de intellectu* (Venice, 1503), I, tr. 4, c. 13, f. 41rb–41va, where he is discussing his own interpretation of Averroes, namely, that there are three agent intellects, the first of which is God. For discussion see my article, "Pier Nicola Castellani and Agostino Nifo on Averroes' Doctrine of the Agent Intellect," *Rivista critica di storia della filosofia* 25 (1970), pp. 387–409, especially pp. 397–407. Nifo's interpretation of Simplicius as holding to the unity of the intellect stands in sharp contrast to Vernia's interpretation. The divergence between Averroes' doctrine of the unity of the intellect and Simplicius' belief that each human being had an intellectual and immortal soul which was proper to him is underscored by Léon Gauthier, *Ibn Rochd (Averroës)* (Paris, 1948), pp. 248–249. Nifo's tendency to interpret Simplicius from an Averroist perspective has been emphasized by Gregory, "Aristotelismo," p. 627 as well as by Nardi.
  32. I should like to emphasize that Nifo should not be given sole credit for initiating that tradition. Surely Vernia and also Pico must be kept in mind. It is surprising that there is no mention of Vernia's contribution to the development of interest in Simplicius and Themistius during the Renaissance in Charles B. Schmitt's essay for the Garin Festschrift, "Filosofia e scienza nelle università italiane del XVI secolo," in *Il Rinascimento, Interpretazioni e problemi* (Bari, 1979), pp. 355–398, especially at pp. 358–359 and 361–362. Dr. Schmitt appears to have overlooked my article, "Nicoletto Vernia on the Soul and Immortality." See note 11 above.
  33. Nifo, *In libros de anima*, III, text. comm. 1, f. 1rab. See Simplicius, p. 217, lin. 23–37. Cf. Ficino, *Argumentum to Ennead I*, I, c. 8, in *Opera omnia*, pp. 1551–1552. In his *Saggi*, pp. 378–379, Nardi identifies some of the passages from Simplicius that Nifo is here quoting, but he does not indicate Ficino's influence. Compare also Nifo, *In libros de anima*, III, comm. 23, f. 47va to Simplicius, p. 124, lin. 18–35; p. 126, lin. 29–30; and p. 252, lin. 5–7, and Ficino, *Argumentum to Ennead I*, 3, c. 1 and that to I, 1, c. 11 in *Opera omnia*, p. 1560 and pp. 1553–1554.
  34. Agostino Nifo, *Liber de intellectu* (Venice, 1503), I, tr. 2, c. 7, ff. 18vb–19ra. See Ficino, *Argumentum to Ennead I*, I, c. 7–8, in *Opera omnia*, pp. 1551–1552. Ficino uses the terms *vita* and *animatio* in *Argumentum to Ennead I*, I, c. 1, p. 1549, and *imago* in I, I, c. 8, p. 1552. For *vestigium* see Ficino, *Theologia platonica*, XV, c. 5, in *Opera omnia*, p. 338. It should be added that the terms "*vita*" and "*animatio*" are also used by Ermolao Barbaro in his translation of Themistius' paraphrases on the *De anima*. See Themistius, *Paraphrasis de anima*, in *Paraphrasis in Aristotelem*, trans. E. Barbaro, I, c. 23, sig. bb2v, lin. 7–8, 17 and 20 (Heinze: p. 25, lin. 34, p. 26, lin. 7, 12–13) for examples. See also Nifo's discussion of the concept of "animations" and "lives" attributed to Plotinus, Iamblichus, and Proclus in *De intellectu*, I, tr. 3, c. 12, which draws on Ficino, *Argumentum to Ennead I*, I, c. 2, 4, 7, 8, 10 and 12. For discussions regarding Plotinus' own doctrine, see Gaetano Capone Braga, "Il problema del rapporto tra le anime individuali e l'anima dell'Universo nella filosofia di Plotino," *Rivista di filosofia* 23 (1932), pp. 106–125, especially p. 111, where the comparison to light and rays is mentioned; H. J. Blumenthal, "Soul, World-Soul and Individual Soul in Plotinus," in *Le Néoplatonisme* (Paris, 1971), pp. 55–63, especially p. 60.
  35. *Ibid.*, I, tr. 2, c. 21, ff. 26vb–27rb. Nifo is relying on Themistius, *In libros Aristotelis de anima*

- paraphrasis, ed. R. Heinze, p. 26, lin. 8–21; *Paraphrasis de anima*, trans. E. Barbaro, I, c. 23, sig. bb2v, lin. 17–28. For discussion see my articles, "Agostino Nifo and Saint Thomas Aquinas," *Memorie Domenicane* 7 (1976), pp. 195–226 at pp. 207–208, and "Themistius and the Agent Intellect," pp. 434–438.
36. *Ibid.*, I, tr. 3, c. 20, ff. 33vb–34ra.
37. *Ibid.*, I, tr. 3, c. 27, f. 36rb. See Ficino. In *Timaeum commentarium*, c. 4, in *Opera omnia*, p. 1439. In the same chapter, Nifo had appealed to John the Evangelist, Paul, Moses, Augustine, and other theologians to argue for personal immortality. A few chapters later (I, tr. 3, c. 32, f. 37vb), he discusses the views of Plotinus and Proclus on the individuation of the soul. He is in fact borrowing almost to the word from Ficino, *Theologia platonica*, XV, c. 13, p. 354. See also *Argumentum to Ennead IV*, 3, c. 3, pp. 1732–1733. Nifo then attacks this position. For discussion see Bruno Nardi, *Sigieri di Brabante nel pensiero del Rinascimento italiano* (Rome, 1945), pp. 162–163; Mahoney, "Agostino Nifo and Saint Thomas Aquinas," pp. 208–209. The "Platonic" theory of the soul and intellect which Nifo presents in *De intellectu*, I, tr. 4, c. 2, f. 38va is taken from Ficino's *Argumentum to Ennead I*, I, c. 9 and 11, pp. 1552–1553. His summary contains a quotation from Ficino's translation of *Ennead I*, I, 11.
38. For a discussion of the one-and-many in regard to Soul, see Bréhier, *The Philosophy of Plotinus*, pp. 64–73. Schwyzer alludes to the same theme in regard to *Nous*. See his article, "Plotinos," col. 556.
39. Agostino Nifo, *De immortalitate animae libellus* (Venice, 1518), c. 5, f. 2rab. There is frequent reference to Themistius and Simplicius in Crisostomo Marcello's *Universalis de anima traditionis opus* (Venice, 1508). See especially V, c. 6–7, ff. 209r–210v and c. 23, ff. 227v–228v. Nifo again makes use of Simplicius and Themistius in his later, Pisan commentary on the *De anima*, but he also makes heavy use of Philoponus. He again says that the Greek commentators, notably Themistius and Simplicius, hold there to be one intellect for all men, but he insists that Aristotle held no such thing. What is more important for our discussion here is that Nifo attacks Vernia for having taught that Plato and Aristotle both held to the preexistence of the human soul and to knowledge as a reminiscence. He argues that Aristotle held neither doctrine. See Nifo, *In libros de anima*, III, comm. 5, ff. 23ra, 23vb, 25rab and 26rb. Earlier in the commentary, he had noted that intelligible and sensible species are concreated with the soul according to Plotinus and the Platonists, for whom sensing and thinking are active and not passive. Nifo separates both Themistius and Aristotle from this position, thereby rejecting Vernia's interpretation of Aristotle and that Commentator. See Nifo, *In libros de anima*, III, comm. 2, f. 4ra–4vb.
40. See Nardi, *Saggi*, pp. 383–442. Vernia's position is apparently ignored by Nardi.
41. "Utor expositoribus graecis, latinis, arabibus; praecipue vero graecis, unde omnis et excitata et consummata philosophiae cognitio est. Iamblichus, Porphyrio, Alexandro, Themistio, Simplicio, Philopono, caeteris huius modi: post hos Averroi, quem ut multis ante se ita nemine post se inferiorem fuisse comperio. Et, hercule, si conferas eius viri scripta cum graecis, invenies singula eius verba singula esse furta ex Alexandro, Themistio, Simplicio. Sed de hoc alias" (Ermolao Barbaro, *Epistolae, orationes et carmina*, ed. Vittore Branca, I [Florence, 1943], p. 92, letter to Arnolfo di Bost, dated 1485). Ermolao and Vernia were in correspondence with one another. See Ermolao's letter to Vernia, dated 1484, in *Epistolae*, I, pp. 79–80. In a letter to Pico, dated 1485 (*ibid.*, I, pp. 84–87, at p. 86). Ermolao cites Simplicius to argue that no one can understand Aristotle if he doesn't also study Plato.
42. The most striking examples of the concern of church authorities regarding these two topics are the relevant propositions condemned by Stephen Tempier at Paris in 1277. Pietro Barozzi's 1489 edict forbidding public discussion of the unity of the intellect at Padua and the decree of the Fifth Lateran Council regarding the unity and mortality of the soul which was issued in 1513.
43. Proclus, *The Elements of Theology*, ed. E. R. Dodds, 2nd ed. (Oxford, 1963). For discussion see E. Vacherot, *Histoire critique de l'école d'Alexandrie*, II (Paris, 1846; rep. Amsterdam, 1965), pp. 227–234, 242, 247–252, 270–280 and 307ff. Laurence Jay Rosan, *The Philosophy of Proclus* (New York, 1949), pp. 66–80, 101–105, 127, 134–135 and 190–192; Hampus Lyttkens, *The Analogy between God and the World: An Investigation of its Background and Interpretation of Its Use by Thomas of Aquino* (Uppsala, 1952), pp. 66–77; Giuseppe Martano, *Proclo di Atene. L'ultima voce speculativa del genio ellenico* (Naples, 1974), pp. 128–129 and 155–158, which is a reprint of his *L'uomo e Dio in Proclo* (Naples, 1952); Jean Trouillard, "La monadologie de Proclus," *Revue philosophique de Louvain* 57 (1959), pp. 310–315; Klaus Kremer, *Die neuplatonische Seinsphilosophie und ihre Wirkung auf Thomas von Aquin* (Leiden, 1966), pp. 119–281, especially pp. 208–233; Annick Charles, "Analogie et pensée sérielle chez Proclus," *Revue internationale de philosophie* 23 (1969), pp. 69–88, especially pp. 69–77. It seems extraordinary that there is no reference to the scheme of ascent-descent and hierarchical gradation in H. F. Müller, *Dionysios, Proklos, Plotinos: Ein historischer Beitrag zur neoplatonischen Philosophie*, BGPM, XX, 3–4 (Münster, 1926).
- For a valuable and careful analysis of Plotinus' own doctrine of hierarchy, see Dominic J. O'Meara, *Structures hiérarchiques dans la pensée de Plotin*, *Philosophia Antiqua*, XXVII (Leiden, 1975), pp. 4–6, 44–47, 79–85, 89–90, 97–98, 101–108, 111, 114 and 120–123. Dr. Salvatore R. C. Lilla has pointed out to me that the conceptual scheme is only suggested in Plotinus but becomes hardened in Syrianus, Iamblichus, Proclus, and Damascius. A precise comparison between Plotinus and these other thinkers is out of place here, but a survey of some of the relevant texts in Plotinus does seem appropriate. Plotinus thus speaks of the One as a measure which is itself not measured (*Enneads V*, 5, 4), as the measure and limit of everything else (I, 8, 2), and as the principle of all things (III, 8, 9; VI, 9, 3). All things imitate the One, but some do so in a distant manner, while others do so in a closer manner. Things are thus arranged in a series of priority and posteriority according as they have more or less unity (VI, 2, 11). That is to say, things exist and are unities according as they participate in the One and are closer to or more distant from the One (V, 3, 15–16). Plotinus discerns a diminution downwards through the realms of living things and of natural things (II, 9, 13; III, 2, 3). In the case of souls, they are ranked according as they are nearer to or further away from the intelligible world (IV, 3, 6), that is, according as they descend more or less from *Nous* (IV, 3, 12 and 17). A fuller treatment of Plotinus' doctrine regarding hierarchy in the living and natural realms would of course have to examine the roles played by Soul and the Logos. For discussion, see O'Meara, p. 89–95. Also relevant to the topic of this essay are Plotinus' remarks about the One that it has no place but is everywhere and yet nowhere (VI, 9, 6; VI, 8, 16; see also VI, 5, 4).
44. Dionysius Areopagita, *De divinis nominibus*, c. 2, #10, c. 4, #4 and c. 5, #6, in *Patrologia Graeca*, III (Paris, 1889), cols. 648C, 697C, 700A, 820–821A; *idem*, *De coelesti hierarchia*, c. 8, #2, col. 240B–C and c. 10, #1, cols. 272D–273B. For discussion see V. Lossky, "La notion des 'Analogies' chez Denys le Pseudo-Aréopagite," *Archives d'histoire doctrinale et littéraire du moyen âge* 5 (1930), p. 292–293 and 298–300; Endre von Ivánka, "Zum Problem des christlichen Neuplatonismus. II. Inwieweit ist Pseudo-Dionysius Areopagita Neuplatoniker?" *Scholastik* 31 (1956), pp. 387–393; Michele Schiavone, *Neoplatonismo e Cristianismo nello Pseudo Dionigi* (Milan, 1963), pp. 76–90, 115–120, 124–133, 198–202 and 215–220. Especially important is René Roques, *L'univers dionysien. Structure hiérarchique du monde selon le Pseudo-Denys* (Paris, 1954), pp. 53–54, 72–81 and 96–106. For a good analysis of the scholarly literature regarding the Pseudo-Dionysius' dependence on Neoplatonism, see Salvatore R. C. Lilla, "Alcune corrispondenze tra il 'De divinis nominibus' dello pseudo-Dionigi l'Areopagita e la tradizione platonica e patristica," in *Studi in memoria di Carlo Ascheri*, Differenze, IX (Urbino, 1970), pp. 149–177. Several scholars have underscored the difference between the Pseudo-Dionysius and the Neoplatonic tradition. See Endre von Ivánka, "'Teilhaben,' 'Hervorgang,' und 'Hierarchie' bei Pseudo-Dionysius und bei Proklos (Der 'Neuplatonismus' des Pseudo-Dionysios)," in *Actes du XIème Congrès International de Philosophie*, XII (Brussels, 1953), pp. 153–158, and also his earlier "La signification du Corpus Areopagiticum," *Recherches de science religieuse* 36 (1949), pp. 5–24, especially pp. 15–18. See also F. Edward Cranz, "The Transmutation of Platonism in the Development of Nicolaus Cusanus and of Martin Luther," in *Niccolò Cusano agli inizi del mondo moderno* (Florence, 1970), pp. 76–77; John M. Rist, "In Search of the Divine Denis," in *The Seed of Wisdom: Essays in Honour of T. J. Meek*, ed. W. S. McCullough (Toronto, 1964), pp. 137–138.
45. For editions of the *Liber de causis*, see Otto Bardenheuer, *Die pseudo-aristotelische Schrift Ueber das reine Gute bekannt unter dem Namen Liber de causis* (Freiburg, 1882); ed. Robert Steele in

- Roger Bacon, *Quaestiones supra librum de causis*, *Opera hactenus inedita Rogerii Baconis*, XII (Oxford, 1935), pp. 161–187; Adriaan Pattin, "Le Liber de Causis. Édition établie à l'aide de 90 manuscrits avec introduction et notes," *Tijdschrift voor Filosofie* 28 (1966), pp. 90–203, which was published separately as *Le Liber de Causis*, ed. A. Pattin (Louvain, 1966). For discussion see Pierre Duhem, *Le système du monde*, IV (Paris, 1916), pp. 329–347; Leo Sweeney, "Doctrine of Creation in *Liber de Causis*," in *An Etienne Gilson Tribute*, ed. Charles J. O'Neil (Milwaukee, 1959), pp. 274–289; Henri-Dominique Saffrey, "L'état actuel des recherches sur le *Liber de causis* comme source de la métaphysique au moyen âge," in *Die Metaphysik im Mittelalter*, *Miscellanea Mediaevalia*, II (Berlin, 1963), pp. 267–281.
46. For discussion regarding the scheme in Augustine, see John Burnaby, *Amor Dei: A Study of the Religion of St. Augustine* (London, 1938 and 1947), pp. 36–41, 90 n. 5, 149–150, 162, 174 and 193–194; Olivier Du Roy, *L'intelligence de la foi dans la Trinité selon saint Augustin* (Paris, 1966), pp. 185–190, 324, 334–337 and 477–478; Robert J. O'Connell, *St. Augustine's Early Theory of Man*, A. D. 386–391 (Cambridge, Mass., 1968), pp. 41, 45–49, 114, 117–120 and 143–144; *idem*, *St. Augustine's Confessions: The Odyssey of Soul* (Cambridge, Mass., 1969), pp. 80–88, 146–149 and 178–181; Émilie Zum Brunn, *La dilemme de l'être et du néant chez saint Augustin* (Paris, 1969); *eudem*, "La dialectique du 'magis esse' et du 'minus esse' chez saint Augustin," in *Le Néoplatonisme* (Paris, 1971), pp. 373–380.
47. See my study, "Metaphysical Foundations of the Hierarchy of Being according to Some Late Medieval and Renaissance Philosophers," which will appear in *Ancient and Medieval Philosophies of Existence*, ed. Parviz Morewedge, to be published by the Fordham University Press in 1981.
48. Albert the Great, *Super Dionysium De divinis nominibus*, ed. Paul Simon, *Opera omnia*, XXXVII, I (Aschendorff, 1972), especially c. 1, 4, 5, and 7. See also *De causis et processu universitatis*, ed. A. Borgnet, *Opera omnia*, X (Paris, 1891), II, tr. 1, c. 8, p. 447b; tr. 2, c. 6, p. 488a; tr. 2, c. 15, pp. 500b–501a, c. 22, p. 512ab, c. 24, pp. 514b–515a; tr. 3, c. 4–5, pp. 553a–554a; *Metaphysica: Libros VI–XIII*, ed. Bernhard Geyer, *Opera omnia*, XIV, 2 (Aschendorff, 1964), X, tr. 1, c. 3, pp. 434–435 and 437–438; *Commentarium in primum sententiarum*, ed. A. Borgnet, *Opera omnia*, XV (Paris, 1893), d. 8, A, a, 7–8, pp. 228–230. For discussion see Rudolf Kaiser, "Die Benutzung proklischer Schriften durch Albert den Grossen," *Archiv für Geschichte der Philosophie* 45 (1963), pp. 1–22; Bernhard Geyer, "Albertus Magnus und die Entwicklung der scholastischen Metaphysik," in *Die Metaphysik im Mittelalter*, pp. 9–10.
49. Thomas Aquinas, *Commentum in primum librum sententiarum*, *Opera omnia*, VII (Paris, 1873), Prolog., q. 1, a. 2, ad 2, p. 6; d. 8, q. 4, a. 1, pp. 115–116, and a. 2, ad 3, p. 118; q. 5, a. 1, p. 120; *Quaestiones disputatae de potentia Dei*, in *Quaestiones disputatae*, II, ed. P. Bazzi, et al. (Turin, 1953), q. 3, a. 5, p. 49; *Summa contra Gentiles*, I (Paris, 1959), c. 28, pp. 224–226; *Super librum De causis expositio*, ed. H. D. Saffrey (Fribourg and Louvain, 1954), prop. 4a, pp. 29–32. The basic study on God as a "measure" according to Aquinas is Gaston Isaye, *La théorie de la mesure et l'existence*, *Archives de philosophie*, XVI, I (Paris, 1940). But see also the important essays of Vincent de Couesnongle, "La causalité du maximum. L'utilisation par saint Thomas d'un passage d'Aristote," *Revue des sciences philosophiques et théologiques* 38 (1954), pp. 433–444; "La causalité du maximum. Pourquoi Saint Thomas a-t-il mal cité Aristote?," *ibid.*, pp. 658–680; "Mesure et causalité dans la 'quarta via'," *Revue thomiste* 58 (1958), pp. 55–75 and 244–284. On the topic of transferring a proportion from a quantitative relationship to any relationship and on analogy in general, see George P. Klubertanz, *St. Thomas on Analogy* (Chicago, 1960), pp. 27, 31–32, 46–49, 83–84 and 88–92; Bernard Montagnes, *La doctrine de l'analogie de l'être d'après Saint Thomas d'Aquin*, *Philosophes médiévaux*, VI (Louvain and Paris, 1963), pp. 75–89. There are scattered remarks regarding the scheme in Pierre Faucon, *Aspects néoplatoniciens de la doctrine de saint Thomas d'Aquin* (Lille and Paris, 1975), but no specific analysis of it. On the connection of the scheme to Thomas' doctrine of participation see my article cited above in note 47.
50. Thomas Aquinas, *Quaestiones disputatae de veritate*, q. 2, a. 3, ad 16, and a. 11, ad 4; q. 23, a. 7, c. and ad 9, in *Quaestiones disputatae*, I, ed. R. Spiazzi (Turin, 1953), pp. 34, 51 and 427–429.
51. Thomas Aquinas, *Summa theologiae*, ed. P. Caramello (Turin, 1952), I, q. 8, a. 1, c. and ad 3, p. 36; q. 9, a. 1, ad 3, p. 40; q. 67, a. 2, ad 3, p. 328. On the metaphorical manner of speaking involved, see Montagnes, *La doctrine*, pp. 88–89; M. T. L. Penido, *Le rôle de l'analogie en théologie dogmatique*, *Bibliothèque Thomiste*, XV (Paris, 1931), p. 103.
52. Siger of Brabant, *Questions sur la Métaphysique*, ed. C. A. Graiff, *Philosophes médiévaux*, I (Louvain, 1948), I, q. 7, pp. 11–22; III, q. 7, pp. 95–96; q. 12, pp. 109–110; q. 8, p. 99 and p. 103. See also Joachim Vennebusch, "Die *Quaestiones metaphysice* tres des Siger de Brabant," *Archiv für Geschichte der Philosophie* 48 (1966), pp. 182–183. For discussion see Fernand Van Steenberghen, "La composition constitutive de l'être fini," *Revue néoscholastique de philosophie* 41 (1938), pp. 489–518, especially pp. 510–518; *idem*, *Maître Siger de Brabant*, *Philosophes médiévaux*, XXI (Louvain and Paris, 1977), pp. 289–293 and 297–301; Armand Maurer, "Esse and Essentia in the Metaphysics of Siger of Brabant," *Mediaeval Studies* 8 (1946), pp. 68–86. The scheme is also to be found in Siger's late questions on the *Liber de causis*. See *Quaestiones super Librum de causis*, ed. Antonio Marlasca, *Philosophes médiévaux*, XII (Louvain and Paris, 1972), q. 46, pp. 163–164.
53. Henry of Ghent, *Summae quaestionum ordinariarum*, I (Paris, 1520; repr. St. Bonaventure, 1953), a. 1, q. 6, f. 27; a. 25, q. 2, f. 148v–150r; a. 26, q. 2, f. 159v; *Summae quaestionum ordinariarum*, II, q. 1, f. 4r and f. 5r; a. 42, q. 2, ff. 6r–8r; *Quodlibeta* (Paris, 1518; repr. Louvain, 1961), Quodl. III, q. 5, f. 53r; IV, q. 15, ff. 124r–124v, 129r and 130r; V, q. 1, f. 152r and f. 143r; q. 3, f. 155v and f. 157r; q. 11, f. 169v; q. 12, f. 171r; VI, q. 1, f. 215r–215v; q. 2, f. 220r; q. 3, f. 221v; IX, q. 1, f. 393v and q. 2, ff. 346r–347r; XI, q. 11, f. 465v, f. 466v and f. 477r. There is no explicit treatment of the scheme in the classic work of Jean Paulus, *Henri de Gand: Essai sur les tendances de sa métaphysique* (Paris, 1938), but see p. 302 n. 2 and pp. 308–309 n. 2. See also José Gómez Caffarena, *Ser participado y ser subsistente en la metafísica de Enrique de Gante* (Rome, 1958), p. 153–158.
54. Giles of Rome, *Quaestiones metaphysicales super libros metaphysicarum Aristotelis* (Venice, 1501; repr. Frankfurt, 1966), X, q. 1, ff. 35va–36ra; q. 3, ff. 36vb–37ra; q. 4, f. 37vab; q. 6, f. 38rb–38vb; XI, q. 1, f. 39rb; *Primum Sententiarum* (Venice, 1521), dist. 8, par. 1, prin. 2, q. 1, a. 2, ff. 47vb–48ra; a. 3, f. 48va; *In secundum librum sententiarum quaestiones*, I (Venice, 1581; repr. Frankfurt, 1968), dist. 1, q. 3, a. 3, pp. 40a–41a; dist. 2, q. 1, a. 2, pp. 109b–110a; dist. 3, pars 1, q. 2, a. 2–5, pp. 195b–197b, 200ab and 206a; dist. 3, pars 2, q. 2, a. 2, p. 245ab; a. 4, pp. 256a–257b. Girolamo Trapè has written a number of highly informative articles on Giles' metaphysics. See for example his "Causalità e partecipazione in Egidio Romano," *Augustinianum* 9 (1969), pp. 91–117. However, there is no explicit discussion of the scheme. In like fashion, William E. Carlo presents texts containing the scheme in Giles' writings, but he too does not explicitly study it. See Carlo's *The Ultimate Reducibility of Essence to Existence in Existential Metaphysics* (The Hague, 1966).
55. Godfrey of Fontaines, Quodl. I, q. 3, in *Les quatre premiers Quodlibets*, ed. M. De Wulf and A. Peizer, *Les philosophes belges*, II (Louvain, 1904), pp. 242–247; Quodl. VII, q. 1, q. 7, q. 8, q. 12, in *Les Quodlibets cinq, six et sept*, ed. M. De Wulf and J. Hoffmans, *Les philosophes belges*, III (Louvain, 1914), pp. 265–266, 359–360, 364 and 388–389; Quodl. X, q. 1, in *Le deuxième quodlibet*, ed. J. Hoffmans, *Les philosophes belges*, IV, 3 (Louvain, 1931), pp. 298–299. It should be emphasized that Godfrey makes very tentative use of the scheme and does not appear to give wholehearted endorsement to it. For discussion see John F. Wippel, "The Dating of James of Viterbo's Quodlibet I and Godfrey of Fontaines' Quodlibet VIII," *Augustiniana* 24 (1974), pp. 348–386, especially pp. 350–362; Maurice De Wulf, *Étude sur la vie, les œuvres et l'influence de Godefroid de Fontaines* (Brussels, 1904), pp. 116–118 and 122–123.
56. On the Pseudo-Dionysius and his influence in the Middle Ages, see Paul Lehmann, "Zur Kenntnis der Schriften des Dionysius Areopagita im Mittelalter," *Revue Bénédictine* 35 (1923), pp. 81–97, especially for earlier period; H. F. Dondaine, *Le Corpus Dionysien de l'Université de Paris au XIII<sup>e</sup> siècle* (Rome, 1953); Josef Koch, "Augustinischer und dionysischer Neuplatonismus und das Mittelalter," *Kant-Studien* 48 (1956/1957), pp. 117–133, reprinted in his *Kleine Schriften*, I (Rome, 1973), pp. 3–25; Joseph Turbessi, "L'influence du Pseudo-Denys en Occident," in *Dictionnaire de spiritualité*, III (Paris, 1957), cols. 343–356; M. Cappuyns, "Le Pseudo-Denys l'Aréopagite en occident au moyen âge," in *Dictionnaire d'histoire et de géographie ecclésiastique*, XIV (Paris, 1960), col. 290–295; Piero Scazzoso, *Ricerche sulla struttura del linguaggio*

dello pseudo-Dionigi Areopagita (Milan, 1967), pp. 193–200. For his influence on Albert, see Francis Ruello, *Les noms divins et leurs "raisons" selon saint Albert le Grand, commentateur du "De divinis nominibus"*, Bibliothèque Thomiste, XXXV (Paris, 1963). The classic study for Thomas is, of course, J. Duranet, *Saint Thomas et le Pseudo-Denis* (Paris, 1919).

On the *Liber de causis*, see Saffrey, "L'état actuel des recherches sur le *Liber de causis*," cited above in note 45. Its influence on Thomas has been studied by various scholars. Among them are C. Vansteenkiste, "Il *Liber de causis* negli scritti di San Tommaso," *Angelicum* 35 (1958), pp. 325–374; Daniel A. Callus, "Les sources de Saint Thomas," in *Aristote et Saint Thomas d'Aquin* (Louvain and Paris, 1957), pp. 149–153; and Werner Beierwaltes, "Der Kommentar zum 'Liber de causis' als neuplatonisches Element in der Philosophie des Thomas von Aquin," *Philosophische Rundschau* 11 (1963), pp. 192–215. The influence of Dionysius and the *Liber de causis* on Giles of Rome is brought out by Girolamo Trapè, "Il platonismo di Egidio Romano," *Aquinas* 7 (1964), pp. 309–344. See also Carlo, *The Ultimate Reducibility*, especially pp. 57–86.

Translations of the *Elements of Theology* and other works of Proclus by William of Moerbeke made him directly accessible to the Christian medievals. See Clemens Baeumker, *Witelo*, BGPM, III, 2 (Münster, 1908), p. 261–271; Martin Grabmann, *Mittelalterliches Geistesleben*, II (Munich, 1936), pp. 413–423; *idem*, *Guglielmo di Moerbeke O. P. il traduttore delle opere di Aristotele* (Rome, 1946), pp. 147–160; Gérard Verbeke, "Guillaume de Moerbeke traducteur de Proclus," *Revue philosophique de Louvain* 51 (1953), pp. 349–373. Moerbeke's translation of the *Elements* has been edited by C. Vansteenkiste in *Tijdschrift voor Filosofie* 13 (1951), pp. 263–302 and 491–531. For influence on Albert in particular, see, among others, Rudolf Kaiser, "Die Benutzung proklischer Schriften durch Albert den Grossen," *Archiv für Geschichte der Philosophie* 45 (1963), pp. 1–22. On Moerbeke's own sympathies for Neoplatonism, see Maurice de Wulf, *Histoire de la philosophie médiévale*, 5th ed., II (Louvain and Paris, 1925), p. 110, Grabmann, *Guglielmo di Moerbeke*, pp. 57–61 and 147–160.

57. On the doctrine of intension and remission of form in medieval philosophy, see Anneliese Maier, *Zwei Grundprobleme der scholastischen Naturphilosophie*, 2nd ed. (Rome, 1951), pp. 1–109; Marshall Clagett, "Richard Swineshead and Late Medieval Physics," *Osiris* 9 (1950), pp. 131–161. There is a good general survey of fourteenth-century developments regarding the latitude of forms in John E. Murdoch, "Mathesis in philosophiam scholasticam introducta: The Rise and Development of Mathematics in Fourteenth-Century Philosophy and Theology," in *Arts libéraux et philosophie au moyen âge* (Montreal and Paris, 1969), pp. 215–254, especially pp. 238–249. See also Edith D. Sylla, "Medieval Concepts of the Latitude of Forms. The Oxford Calculators," *Archives d'histoire doctrinale et littéraire du moyen âge* 40 (1973–1974), pp. 223–283, especially pp. 252–256.
58. On Swineshead's influence in Italy during the fifteenth and sixteenth centuries, see Marshall Clagett, *The Science of Mechanics in the Middle Ages* (Madison, 1961), pp. 644–652 and 659–671; John E. Murdoch and Edith Dudley Sylla, "Swineshead, Richard," in *Dictionary of Scientific Biography*, XIII (New York, 1976), pp. 184–213, at pp. 209–210 and 212. See also Carlo Dionisotti, "Ermolao Barbaro e la fortuna di Suiseth," in *Medioevo e Rinascimento: Studi in onore di Bruno Nardi*, I (Florence, 1955), pp. 217–253; Garin, *Storia della filosofia italiana*, pp. 444–449 and 456–457.
59. Paul of Venice, *Scriptum super librum de anima* (Venice, 1481), II, tr. 1, c. 3, t. c. 2, sig. e7rb; *Expositio super octo libros physicorum Aristotelis necnon super commento Averrois cum dubiis eiusdem* (Venice, 1499), V, tr. 1, c. 3, t. c. 19, sig. B5rb.
60. See Paul O. Kristeller, *The Philosophy of Marsilio Ficino*, trans. V. Conant (New York, 1943), pp. 74–84 and 98–109; *idem*, *Il pensiero filosofico di Marsilio Ficino* (Florence, 1953), pp. 66–77 and 93–105. The general conception of the scheme was accepted by Ficino in his early *Tractatus de Deo, natura et arte*, written in 1454 or 1455. See Kristeller, *Studies in Renaissance Thought and Letters* (Rome, 1956), pp. 44–46 and 64–65. The joint influence of Neoplatonism and Thomism on Ficino's metaphysics has been well highlighted by Kristeller, *Medieval Aspects of Renaissance Learning*, ed. and trans. E. P. Mahoney, Duke Monographs in Medieval and Renaissance Studies, I (Durham, N.C., 1974), pp. 76–77.
61. See Kristeller, *The Philosophy*, p. 14 and p. 160; *idem*, *Il pensiero*, p. 27 n. 4 and p. 169 n. 1.
62. Marsilio Ficino, *The "Philebus" Commentary*, ed. and trans. Michael J. B. Allen (Berkeley, Los Angeles and London, 1975), I, c. 27, pp. 251–257, c. 36, pp. 359–365; II, c. 1, pp. 387–393. For discussion regarding whether God is transcendent to or included within the ascending hierarchy of things, see Walter Dress, *Die Mystik des Marsilio Ficino* (Berlin and Leipzig, 1929), pp. 34–35 and 55, and Giuseppe Anichini, *L'Umanesimo e il problema della salvezza in Marsilio Ficino* (Milan, 1937), pp. 34–37. See also Kristeller, *The Philosophy*, pp. 82–83; *idem*, *Il pensiero*, pp. 75–77; Ardis Collins, *The Secular is Sacred: Platonism and Thomism in Marsilio Ficino's "Platonic Theology"* (The Hague, 1974), pp. 18–19, 44–45, and 55–56.

63. Marsilio Ficino, *Theologia Platonica*, II, c. 2 and c. 3, in *Opera omnia*, pp. 93 and 95. For Ficino's commitment to the scheme see *ibid.*, X, c. 3, p. 226 and XI, c. 6, pp. 259–260. Kristeller brings out Ficino's adoption of the scheme. See ch. IX of *The Philosophy*, entitled "Primum in Aliquo Genere," especially pp. 147, 150–153 and 159–166 (*Il pensiero*, pp. 154–155, 157–161 and 167–175). For discussion on the way in which Ficino's philosophy reflects both the Plotinian and medieval conceptions of hierarchy, the one emphasizing a few general spheres and the other accepting only grades or species, see Kristeller, *The Philosophy*, pp. 75–76 and 80–82 (*Il pensiero*, pp. 67–68 and 72–75); Michael J. B. Allen, "The Absent Angel in Ficino's Philosophy," *Journal of the History of Ideas* 36 (1975), pp. 219–240. See also A. K. Lloyd, "Primum in genere: The Philosophical Background," *Diotima* 4 (1976), pp. 32–36, who emphasizes the background of Aristotle, Plotinus, and Proclus. It should perhaps be noted that, while Ficino does accept the two poles of the scheme, he especially emphasizes the role of God as a measure.
64. Ficino, *Theologia Platonica*, XI, c. 4, pp. 247–249 and 252–253.
65. See George of Trebizond, *Comparationes [sic] philosophorum Aristotelis et Platonis* (Venice, 1523; repr. Frankfurt, 1965), II, c. 2, sig. D4v5 and E7v, who argues that all creatures are equally distant from God inasmuch as all are infinitely distant from him. In his *In calumniatorem Platonis libri IV*, III, c. 6, in Ludwig Mohler, *Kardinal Bessarion als Theologe, Humanist und Staatsmann*, II (Paderborn, 1927; repr. Aalen, 1967), pp. 238–239, Cardinal Bessarion escapes from George's criticism by suggesting that that relation of creatures to God can be understood either as to an infinite God or as to a being that is more perfect than any other being and which is the highest being. He uses texts from Aquinas and Augustine in arguing for his general position.
66. Gabriele Zerbo adopts the scheme in his *Quaestiones metaphysicales* (Bologna, 1482), I, q. 1, sig. A3vb–A4ra; XII, q. 10, sig. ee5ra–ee6rb. He rejects the position and arguments of the "Calculator," that is, Swineshead, in X, q. 3, sig. aa3rb–aa4rb.
67. See Pearl Kibre, "Cardinal Domenic Grimani, 'Questio de Intensione et Remissione Qualitatis': A Commentary on the Tractate of that Title by Richard Suiseth (Calculator)," in *Didascalie: Studies in Honor of Anselm M. Albareda*, ed. Sesto Prete (New York, 1961), pp. 187–194.
68. Pietro Pomponazzi, *Corsi inediti dell'insegnamento padovano*, vol. 1: "Super libello de substantia orbis expositio et quaestiones quatuor" (1507), ed. Antonino Poppi (Padua, 1966), c. 2, pp. 110–111; q. 1, pp. 195 and 210; *idem*, *Tractatus de intensione et remissione*, in his *Tractatus acutissimi, utilissimi et mere peripatetici* (Venice, 1525), Proemium and Sectio prima, c. 1, f. 2rab; c. 5–7, ff. 3ra–3vb; Sectio quinta, c. 6–7, ff. 15vb–17vb. For a discussion of the latter work, see Curtis Wilson, "Pomponazzi's Criticism of Calculator," *Isis* 44 (1953), pp. 355–363.
69. Antonio Trombetta, *Opus in Metaphysicam Aristotelis Padue in thomistas discussam cum quaestionibus perutilissimis antiquioribus adiectis* (Venice, 1502), f. 84rb. See also f. 77vb and 94rb. On Trombetta see Antonino Poppi, "Lo scotista patavino Antonio Trombetta (1436–1517)," *Il Santo* 2 (1962), pp. 349–367.
70. Thomas de Vio, *In De ente et essentia D. Thomae Aquinatis commentaria*, ed. M. H. Laurent (Turin, 1934), c. 5, #103, pp. 162–163, and c. 6, #131, pp. 210 and 212–213; Iacobus Brutus, *Corona Aurea* (Venice, 1496), sig. i7r–i8v. Cajetan's commentary was finished at Padua in 1495. A few years later, in a question finished at Pavia in 1499, he faced the problem of how God could be infinitely distant from creatures and yet measure them by their approach to him. See his "Utrum Deus gloriosus sit infinitae virtutis," in his *Opuscula omnia* (Venice, 1588), p. 193a and p. 205b. For discussion see Antonino Poppi, *Causalità e infinità nella scuola padovana dal 1480 al 1513* (Padua, 1966), pp. 170–185.
71. See *Destructiones destructionum Averrois cum Augustini Niphi de Suessa expositione*, cited above in note 26.
72. For references to the *Liber de causis*, see *ibid.*, III, dub. 12, f. 35vb; VII, dub. 3, f. 84vb; VII,

- dub. 5, f. 89ra; XIV, dub. 1, f. 122rb. Albert's commentary on the work is cited at XIV, dub. 1, f. 119ra. On the possible influence of Thomas, see my article, "Agostino Nifo and Saint Thomas Aquinas," pp. 197-198.
73. *Ibid.*, III, dub. 12, ff. 35rb-36vb; dub. 16, ff. 42vb-43ra; VIII, dub. 1, f. 92ra. See also III, dub. 14, f. 14vb; dub. 19, f. 52ra; V, dub. 3, f. 70rb. The scheme also appears in Nifo's *De intellectu* and his commentaries on Aristotle's *De anima* (1503) and Averroes' *De beatitudine animae* (1508). For further discussion see my article, "Pier Nicola Castellani and Agostino Nifo on Averroes' Doctrine of the Agent Intellect," especially pp. 397-405.
74. Marcantonio Zimara, *Annotationes in Joannem Gandavensem super quaestionibus Metaphysicae*, in John of Jandun, *Quaestiones in duodecim libros Metaphysicae* (Venice, 1505), f. 174rb-174va and f. 175va; *Theoremata seu memorabilium propositionum limitationes* (Venice, 1539), prop. 10, f. 6ra; prop. 12, f. 9ra; prop. 13, f. 9vab. On Zimara see Antonio Antonaci, *Ricerche sull'aristotelismo del Rinascimento: Marcantonio Zimara I* (Lecce-Galatina, 1971); Nardi, *Saggi*, pp. 321-355.
75. On Achillini see Herbert Matsen, *Alessandro Achillini (1463-1512) and His Doctrine of "Universals" and "Transcendentals"* (Lewistown, 1974); Nardi, *Saggi*, pp. 179-279; Garin, *Storia della filosofia italiana*, pp. 502-504 and 563-564.
76. Zimara, *Theoremata*, prop. 13, ff. 9vb-10ra.
77. Alessandro Achillini, *De intelligentiis quodlibeta* (Bologna, 1494), Quodl. I, q. 1, sig. A2ra; Quodl. II, q. 1, sig. B6ra; q. 4, sig. C4vb; Quodl. V, q. 1 and q. 2, sig. F3ra-F3va and F4ra-F5ra. For discussion, see Nardi, *Saggi*, pp. 200-202 and 220-221.
78. Zimara, *Theoremata*, prop. 13, f. 10ra.
79. Giovanni Crisostomo Javelli, *Epitome super propositionibus libri de causis* (Venice, 1567), prop. IV, ff. 28r-30r.
80. Gaspare Contarini, *Primae philosophiae compendium*, in his *Opera* (Paris, 1571), II, pp. 106-107, 110, and 117; III, p. 123; IV, pp. 141-143; VI, pp. 161-162 and 167.
81. Francesco Buonamici, *De motu libri decem* (Florence, 1591), X, c. 17, p. 928; c. 40, pp. 975-976; c. 42, pp. 979-980; c. 43, pp. 981-982. For further analyses of this work see Alexandre Koyré, *Études galiléennes*, I (Paris, 1939), pp. 18-41; William A. Wallace, "Buonamici, Francesco," *Dictionary of Scientific Biography*, II (New York, 1970), pp. 590-591. Professor Wallace was kind enough to draw my attention to these passages. I shall examine the thought of Contarini, Buonamici, Galileo, Mazzoni, and Cremonini regarding hierarchy in greater detail on another occasion.
82. *Ibid.*, X, c. 42, pp. 980-981. He explicitly attacks the "Calculator" (that is, Swineshead) and Achillini for taking the zero grade of being as the sole measure of hierarchy. See X, c. 41, p. 977.
83. Galileo Galilei, "Juvenilia," q. 5, in *Le opere di Galileo Galilei*, ed. Antonio Favaro, I (Florence, 1890), p. 78, lin. 14-25 and p. 95, lin. 32 to p. 96, lin. 4. However, Galileo does not discuss in these passages whether the zero grade of being can be taken as the measure of all things. The *Juvenilia* are early notebooks apparently based on the lecture notes of various Jesuit professors at the Collegio Romano and other writers. See William A. Wallace, "Galileo and the Thomists," in *Saint Thomas Aquinas, 1274-1974: Commemorative Studies*, I (Toronto, 1974), pp. 293-330, especially pp. 325-330; *idem*, *Galileo's Early Notebooks: The Physical Questions* (Notre Dame, 1977), pp. v-viii, 12-24 and 270-274; *idem*, "Galileo Galilei and the Doctores Parisienses," in *New Perspectives on Galileo*, eds. Robert E. Butts and Joseph C. Pitt (Dordrecht and Boston, 1977), pp. 87-138; A. C. Crombie, "The Sources of Galileo's Early Natural Philosophy," in *Reason, Experiment, and Mysticism in the Scientific Revolution*, eds. M. L. Righini Bonelli and William R. Shea (New York, 1975), pp. 157-175 and 303-305.
84. Jacopo Mazzoni, *In universum Platonis et Aristotelis philosophiam praeludia sive de comparatione Platonis et Aristotelis* (Venice, 1597), p. 16 and pp. 47-48. Professor Wallace and Professor Frederick Purnell, Jr. brought these passages to my attention and discussed them with me. Mazzoni rests much of his argument on Contarini's *Primae philosophiae compendium*, but he also makes some use of Aquinas. On Galileo's relations with Mazzoni, see Frederick Purnell, Jr., "Jacopo Mazzoni and Galileo," *Physis* 14 (1972), pp. 273-294. Both Mazzoni and Cremonini are mentioned by Alexander Koyré in his *Metaphysics and Measurement* (Cambridge, Mass., 1968), pp. 35-36; *Études d'histoire de la pensée scientifique* (Paris, 1966), pp. 12, 149, 152, 167-168 and 197; "Galileo and Plato," *Journal of the History of Ideas* 4 (1943), pp. 402 and 420-421.
85. Cesare Cremonini, *Disputatio de coelo in tres partes divisa* (Venice, 1613), Part III, Section 2, c. 2, pp. 320-321; c. 3, pp. 321-322; c. 4, pp. 323-326; c. 5, pp. 327-330; and c. 6, pp. 330-331 and 333. He cites in the first text (pp. 320-321) Nifo's *De intellectu* (Venice, 1503), I, tr. 4, ff. 43vb-44va and Zimara's *Theoremata*, prop. 40, ff. 25vb-26rb. For Galileo's acquaintance with Cremonini, see Antonio Favaro, *Galileo Galilei e lo studio di Padova*, 2 vols. (Florence, 1883), I, pp. 282-283, 392-394 and 466; II, pp. 29-30, 36-42, 87 and 283. On the thought of Cremonini, see among others Léopold Mabillean, *Étude historique sur la philosophie de la Renaissance en Italie (Cesare Cremonini)* (Paris, 1881), especially pp. 191-264, 349-355, and 357-366; Giuseppe Saitta, *Il Rinascimento*, 2nd ed., II (Florence, 1961), pp. 436-454, who discusses Cremonini's *De coelo* but not the scheme; Maria Assunta Del Torre, *Studi su Cesare Cremonini, Cosmologia e logica nel tardo aristotelismo padovano* (Padua, 1968), especially pp. 53-88; Stillman Drake "Galileo and the Career of Philosophy," *Journal of the History of Ideas* 38 (1977), pp. 12-32, especially pp. 21-28. In his *Storia della filosofia italiana*, p. 559, Eugenio Garin appears to attribute the scheme to Cremonini, but the matter is not wholly clear. In any case, he does not mention the passages in Cremonini's *De coelo* which we have cited.
86. See *Enneads* V, 5, 10; V, 8, 9; VI, 5, 11; VI, 7, 32; VI, 8, 9; VI, 9, 6. On the One as infinite and on Plotinus' general doctrine of infinity see Joseph Moreau, "L'un et les êtres selon Plotin," *Giornale di metafisica* 11 (1956), pp. 209-213 and 221; Leo Sweeney, "Infinity in Plotinus," *Gregorianum* 38 (1957), pp. 515-535 and 713-732; *idem*, "Another Interpretation of *Enneads* VI, 7, 32," *The Modern Schoolman* 38 (1960-1961), pp. 289-303; *idem*, "Basic Principles in Plotinus' Philosophy," *Gregorianum* 42 (1961), pp. 506-516; W. Norris Clarke, "Infinity in Plotinus: A Reply," *Gregorianum* 40 (1959), pp. 75-98; Rist, *Plotinus*, pp. 24-37. Of particular note are two essays of A. H. Armstrong, "Plotinus' Doctrine of the Infinite and its Significance for Christian Thought," *The Downside Review* 73 (1955), pp. 47-58, especially p. 53, and "God's Transcendence and Infinity" in A. H. Armstrong and R. A. Markus, *Christian Faith and Greek Philosophy* (New York, 1960), pp. 8-15, especially p. 12. He comments that when Plotinus calls the One the measure, he does not refer to him as infinite. I hope to return to this point on another occasion.
87. See *Enneads*, VI, 8, 9 and 20. For comment see A. H. Armstrong, *An Introduction to Ancient Philosophy* (Boston, 1963), pp. 155 and 182; O'Meara, *Structures hiérarchiques*, pp. 58-59, n. 22 and p. 98, nn. 12-13.
88. For bibliography on Proclus, see note 43 above. In his commentary on the *Elements of Theology* (p. xxi), Dodds notes that Proclus hardens into a "law" what Plotinus expresses only in a tentative fashion. See also my essay, "Metaphysical Foundations," n. 2.
89. See William R. Schoedel, "'Topological' Theology and Some Monistic Tendencies in Gnosticism," in *Essays on the Nag Hammadi Texts in Honour of Alexander Böhlig*, ed. Martin Krause (Leiden, 1972), pp. 88-108; *idem*, "Enclosing, Not Enclosed: The Early Christian Doctrine of God," in *Early Christian Literature and the Classical Intellectual Tradition: In Honorem Robert M. Grant* (Paris, 1979), pp. 75-86. I am indebted to my colleague at Duke, Professor Robert C. Gregg, for bringing these essays to my attention.
90. On the contrary, Gregory rejects the notion of degrees of "more" and "less" being, appears to consider all creatures to be an equal distance from God, and maps out major divisions in the metaphysical hierarchy rather than a gradually ascending scale of degrees or species. Indeed, he appears to reserve the notions of degrees of perfection and of "more" and "less" participation for the human being's striving for greater and greater perfection and likeness to God, a God who by reason of his infinity will never be reached. See the clear and helpful study of David L. Balás, *ΜΕΤΟΨΙΑ ΘΕΟΥ: Man's Participation in God's Perfections according to Saint Gregory of Nyssa*, *Studia Anselmiana*, IV (Rome, 1966), pp. 44, 51, 55, 62, 77-78, 114-115, 130-135 and 154-155. See also Endre Ivánka, *Hellenisches und Christliches im frühbyzantinischen Geistesleben* (Vienna, 1948), pp. 43-49 and Ekkehard Mühlberg, *Die Unendlichkeit Gottes bei Gregor von Nyssa* (Göttingen, 1966), especially pp. 147-165. For a sample of Gregory's notion of the soul's unending ascent upwards toward an infinite God who can never be reached, see his *De vita*

*Moyssis*, ed. Herbert Musurillo, *Gregorii Nysseni Opera*, vol. VII, pars I (Leiden, 1964), Book II, pp. 110–117.

91. This essay was completed in its final form during the tenure of a fellowship from the John Simon Guggenheim Foundation for 1979–1980. Many friends and colleagues have discussed with me various of the topics which it covers. However, I must thank in particular Robert C. Gregg, Paul O. Kristeller, Dominic O'Meara, and Frederick Purnell for helpful advice and information which enabled me to complete the essay.

## ANDREAS CAMUTIUS ON THE CONCORD OF PLATO AND ARISTOTLE WITH SCRIPTURE

*Note:* Research for this paper was facilitated by grants from the Harvard University Center for Renaissance Studies, The American Philosophical Society, and the John Simon Guggenheim Memorial Foundation. I am also indebted to the Biblioteca Trivulziana of Milan for providing a microfilm of Camuzio's *Praefatio*. B. P. Copenhaver and P. O. Kristeller made various helpful suggestions while I was preparing the final draft for publication.

1. See esp. J. Soudek, "The Genesis and Tradition of Leonardo Bruni's Annotated Latin Version of the (Pseudo-)Aristotelian *Economics*," *Scriptorium* 12 (1958), 260–8; "Leonardo Bruni and His Public: a Statistical and Interpretative Study of the Annotated Latin Version of the (Pseudo-)Aristotelian *Economics*," *Studies in Medieval and Renaissance History* 5 (1968), 51–136; "A Fifteenth-Century Humanistic Bestseller: the Manuscript Diffusion of Leonardo Bruni's Annotated Latin Version of the (Pseudo-)Aristotelian *Economics*," in *Philosophy and Humanism: Renaissance Essays in Honor of Paul Oskar Kristeller* (Leiden, 1976), 129–143; H. Goldbrunner, "Durandus de Alvernia, Nicolaus von Oresme und Leonardo Bruni. Zu den Übersetzungen der pseudo-aristotelischen *Ökonomik*," *Archiv für Kulturgeschichte* 50 (1968), 200–39; "Leonardo Bruni's Kommentar zu seiner Übersetzung der pseudo-aristotelischen *Ökonomik*: ein humanistischer Kommentar," in eds. A. Buck and O. Herding, *Der Kommentar in der Renaissance* (Bonn-Bad Godesberg, 1975), 99–118. In general see E. Garin, "Le traduzioni umanistiche di Aristotele nel secolo XV," *Atti dell'Accademia fiorentina di scienze morali "La Colombaria"* N.S. 2 (1947–50), 55–104.
2. M. Florid, *Incunabula classicorum* (Amsterdam, 1973).
3. See F. E. Cranz, *A Bibliography of Aristotle Editions, 1501–1600* (Baden Baden, 1971), which is far from complete.
4. This is true for essentially all of Aristotle's works. The documentation for this will appear in the section on Latin translations of Aristotle which I am preparing for *Catalogus translationum et commentariorum*. One typical example is the pseudo-Aristotelian *De virtutibus et vitiis* of which there is a single thirteenth-century translation, three fifteenth-century translations, eight versions from the sixteenth century, and two from the early seventeenth century. See my "Aristotle's Ethics in the Sixteenth Century: Some Preliminary Considerations" in *Ethik im Humanismus*, eds. W. Rüegg and D. Wuttke (Boppard, 1979), 87–112.
5. Fabro, *La nozione metafisica di partecipazione secondo S. Tommaso d'Aquino* (Milan, 1939) and later editions and translations.
6. The terms "generatio" and "corruptio" were used in all the medieval translations to render γένεσις and φθορά. The same usage continued through the fifteenth century with the translations of Georgius Trapezuntius and Andronicus Callistus and into the sixteenth century with the new rendering of Agostino Nifo, who in this matter might be called the last of the medievals. The other sixteenth-century translations by Vatable (1519), Alcionio (1521), Péron (1550), Grouchy's revision (1552), and Nobili (1567) wavered between the titles of *De ortu et interitu* (Vatable, Péron, and Grouchy) and *De generatione et interitu* (Alcionio and Nobili). The new usage gradually won the day at the end of the sixteenth century with Vatable's translation getting into both the Casaubon and Duval editions. For further details and documentation see my "Some Observations on the Renaissance Translations of Aristotle" to appear in the proceedings of the Colloquium on the Transmission and Reception of Knowledge held at Dumbarton Oaks (Washington) in May, 1977.

7. For one example see E. J. Ashworth, "Agostino Nifo's Reinterpretation of Medieval Logic," *Rivista critica di storia della filosofia* 31 (1976), 354–374.
8. This has yet to be worked out in detail, but see E. Garin, *Rinascite e rivoluzioni. Movimenti culturali dal XIV al XVIII secolo* (Bari, 1975), 316.
9. D. P. Walker, *The Ancient Theology* (London, 1972), incorporating papers written in the early 1950s.
10. See the references given in my "Reappraisals in Renaissance Science," *History of Science* 16 (1978), 200–214, at 212n26.
11. See C. B. Schmitt, *A Critical Survey and Bibliography of Studies on Renaissance Aristotelianism, 1958–1969* (Padua, 1971) and "Towards a Reassessment of Renaissance Aristotelianism," *History of Science* 11 (1973), 159–193.
12. On this see the literature cited in *Storia di Milano* (Milan, 1953–1966) XI, 353n5.
13. The full title of the work is *Andree Camutii ad reverendissimum et illustrissimum episcopum et principem Tridentinum dominum D. Christophorum Matruccium, in Sacrarum Literarum cum Aristotele et Platone concordiam. Praefatio*. At the end we read: "Ex Academia Ticinensi pridie nonas Decembris, anno virginiei partus M.D.XLI. Sacrarum Literarum placita, neque Aristoteli neque Platoni aliqua ex parte adversari, et fatemur, et asserimus. Disputabitur Mediolani, die et hora alias publicanda. Excudebat Ticini Io. Maria Simoneta." The only copy known to exist is in the Biblioteca Trivulziana and is described in *Le cinquecentine della Biblioteca Trivulziana, II Le edizioni lombarde*, ed. G. Bologna (Milan, 1966), 131 (no. 283) and *Index aureliensis* VI, 382 (no. 130, 936). My citations will be to my photocopy which I have paginated from the beginning and it is hereafter referred to simply as *Praefatio*.
14. I have used the following sources: Zedler, *Grosses Universal Lexicon* (Halle-Leipzig, 1732–1754) V, 491; Supplementband IV, 1367; C. G. Jocheer, *Allgemeines Gelehrten-Lexicon* (Leipzig, 1750–1751) I, 1617; J. C. Adelung, *Fortsetzung und Ergänzungen* (Leipzig, 1784–1897; repr. Hildesheim, 1960–1961) II, 72; F. Argelati, *Bibliotheca scriptorum Mediolanensium* (Milan, 1745; repr. Farnborough, 1966), 2076–2077; G. B. Giovio, *Gli uomini della Comasca* (Modena, 1784), 326; A. Fabroni, *Historia Academiae Pisanae* (Pisa, 1791–1795; repr. Bologna, 1971) II, 281–284; *Dictionnaire historique, critique et bibliographique* (Paris, 1821–1823) V, 418; Michaud, *Biographie universelle*, nouv. éd. (Paris, 1854) VI, 524; Hoefer, *Nouvelle biographie générale* (Paris, 1855–1866), VIII, 431–432; *Dictionnaire historique et biographique de la Suisse* XII (1924), 396; *Biographisches Lexikon der hervorragenden Ärzte* (Berlin-Vienna, 1929–1935) I, 816; M. E. Cosenza, *Biographical and Bibliographical Dictionary of the Italian Humanists* (Boston, 1962) I, 815; A. L. Albanese, "The Theory of Love and Happiness of Andrea Camuzio" (Ph.D. thesis, Columbia University, 1973 = *Dissertation Abstracts* 34 (1973), p. 2544A [order no. 73–28 180] adds little which is new. Of these Argelati and Fabroni are probably the most helpful. I have not been able to see G. A. Oldelli, *Dizionario storico-ragionato degli uomini illustri del Canton Ticino* (Lugano, 1807–1811) and G. Ghilini, *Alcune biografie di medici illustri [per nozze Tecchio-Sardi]* (Venice, 1880).
15. See the material cited in note 12 and C. Salzmann, "Francesco Camuzios Consilium über das Steinleiden," *Gesnerus* 8 (1951), 168–176 and "Der Luganensee. Betrachtung zu einem Brief des Humanisten Francesco Cicercio aus Mailand an den Luganenser Arzt Girolamo Camuzio aus den Jahr 1539," *Gesnerus* 10 (1953), 69–76.
16. Argelati (note 14), 2076.
17. "Neque enim me praeterit multos esse, qui me plus iusto audacem dicant et temerarium, quod iuvenis adhuc utpote novem et viginti vix natus annos, de altissimis philosophiae locis (nam et theologiam eandem esse cum philosophia contendimus) de sublimibus naturae mysteriis, quae nemo hactenus ne olfacere quidem ausus est nedum adgredi, in amplissimo doctissimorum hominum coetu saepe disputationes promulgare non dubitem" (*Praefatio*, 19).
18. See note 34 below.
19. The secondary works agree on this and it seems to be the implication of various indirect statements in the *Praefatio*.
20. *Memorie e documenti per la storia dell'Università di Pavia* (Pavia, 1877–1878; repr. Bologna, 1970) I, 121, 169.
21. *Ibid.*, 169: "Dal 1538 al 1559 non insegnò, cessò affatto dal 1568, nel qual anno credesi morto."

22. Jerome Cardan, *The Book of My Life* (*De vita propria liber*), trans. J. Stoner (New York, 1930; reprint New York, 1962), 44. For the original text see Jérôme Cardan, *Ma vie*. Texte présenté et traduit par Jean Dayre (Paris, 1936), 30.
23. *Andreae Camutii disputationes quibus Hieronymi Cardani magni nominis viri conclusiones infirmantur, Galenus ab eiusdem iniuria vindicatur. Hippocrates praeterea aliquot loca diligentius multo, quam unquam alias explicantur* (Paris, 1563) [copy used: British Library 774.b.9(3)]. According to the table of contents in volume I of Cardano's *Opera* (Lyon, 1663) this work should appear in volume VIII, but I have been unable to locate it in the reprint (Stuttgart-Bad Cannstatt, 1966).
24. This presumably happened in 1568 when he left Pavia. See above note 21. According to Hoefer (note 14) he was called to Vienna in 1564.
25. *Andreae Camutii Serenissimae Imperatricis physici de amore atque felicitate libri novem* (Vienna, 1574) [copy used Vatican Library Barb. L.IX.25]. There is a manuscript of this work which I have not seen in Milano, Biblioteca nazionale Braidense A. G. IX, 31 [see P. O. Kristeller, *Iter Italicum* (London-Leiden, 1963f.) I, 358]. The manuscript version is in six books.
26. *Ibid.*, fol. 311v. The letter is dated July 1, 1574.
27. *Andreae Camutii . . . excussio brevis praecipue morbi nempe cordis palpitacionis Maximiliani secundi Caesaris invictissimi simul ac aliorum aliquot virorum illustrium praeter naturam affectuum* (Florence, 1578) [copy used British Library 1187. a. 1(1)]. I have not seen the reprint of the same work issued at Florence in 1580 [Index Aureliensis 130, 942]. There is a substantial literature on the illness and death of Maximilian II. See H. Schöppler, "Über den Tod Kaiser Maximilians II.," *Mitteilungen zur Geschichte der Medizin und der Naturwissenschaften* 9 (1910), 219–225, which cites the earlier literature.
28. E.g., *Dictionnaire . . . de la Suisse* (note 14) XII, 396 and *Biographisches Lexikon der . . . Ärzte* (note 14) I, 816. See note 21 for a death date as early as 1568.
29. Fabroni (note 14). His presence there is corroborated by Pisa, Archivio di Stato, Univ. G. 77, fols. 155–165 and Univ. 178–179, during which time he was the highest paid professor in the Faculty of Arts at Pisa, earning more than twice the salary of his nearest rival.
30. Fabroni (note 14) II, 341–344. Cf. Schmitt, "Girolamo Borro's *Multae sunt nostrorum ignorantium causae* (Ms. vat. Ross. 1009)" in *Philosophy and Humanism: Renaissance Essays in Honor of Paul Oskar Kristeller* (Leiden, 1976), 462–476, at 463–464.
31. Camuzio is listed in the *rotulo* published in *Le opere di Galileo Galilei*, ed. A. Favaro (Florence, 1929–1939), XIX, 33.
32. I have thus far uncovered no information regarding the precise date of his death. He is not listed in the Pisa *rotulo* for the academic year 1587–1588, cited above in note 29.
33. H. Jedin, *A History of the Council of Trent*, trans. F. Graf (London, 1957f.) I, 570n6.
34. MS Vat. lat. 3725 [s. XVI, 22 fols., on vellum, well written in a neat italic hand; see Kristeller, *Iter II*, 323]. *Andreas Camutius contra Martinum Lut[he]ri. Ad S.D.N. Paulum III Pontificem Max. in ecclesiae catholicae defensionem contra hueresiarchas nostrae tempestatis Andreae Camutii, praefatio*. The MS is dated "Lucani pridie Kalendas Iulias anno virginiei partus 1544." At the end is written: "Disputabitur Romae die et hora alias publicanda." This formula is the same as that used in *Praefatio*, cited above in note 13.
35. "Huius monitis alias Aristotelis et Platonis dogmata pro viribus publica disputatione conciliavi, quod caeteri utriusque interpretes ne somniant quidem, tantum abest ut praestiterint: Ioannem Picum Mirandulam excipio, qui in epistola quadam ad Angelum Politianum, pollicitus est quidem Aristotelis et Platonis concordiam, sed morte praeventus quod pollicitus fuerat, conficere non potuit. Porro quam strenue aut (si quibus potius arridet) quam male me gesserim hoc in negotio, testes sunt viri Bononienses nobilissimi, quorum incredibilem expertum sum humanitatem nullo aeo posthabendam: testis est clarissima Patavinorum et Ticinensium Academia. Deffendi et seorsum prius cuncta Platonis dogmata: adhuc genii eiusdem instinctu priusquam publice profiterer, quartum et vigesimum vix natus annum, omnes pene dignas Aristotelis interpretum controversias collegi summo cum labore, deffendique in utranque partem in clarissimo Ticinensium Gymnasio" (*Praefatio*, 19–20). For Pico's letter to Poliziano (i.e., *De ente et uno*) see G. Pico della Mirandola, *De hominis dignitate, Heptaplus, De ente et uno*, ed. E. Garin (Florence, 1942), 385–441. Camuzio then goes on to quote at length Gianfrancesco Pico's account of his uncle's attempt to reconcile Plato and Aristotle. Cf. G. F. Pico, *Opera quae extant omnia* (Basel, 1601), 486 [*Examen vanitatis* 1.2].
36. *Andreae Camutii theoricam in Gymnasio Ticinensi primo loco publice profitentis, de humano intellectu libri quatuor* (Pavia, 1564) [copy used Florence, Biblioteca nazionale 5. 9. 56]. The prefatory letter, dated June 1564, reads in part: "Verum enimvero profusa Dei benignitas interim credentibus ultro nobis, affatim sapientiae latices effundit, humanam certitudinem (quam scientificae demonstrationes parturiunt) longo intervallo superantes. Adeo constat experientia (quanquam humanae cognitionis fineis egreditur) fidei habitum, ei quem scientiae gignunt, anteire: quod adpositissime summi vir ingenii Mirandulanus ille Ioannes Picus aetatis suae decus adnotavit" (fol. 3<sup>v</sup>).
37. "Obijcient (dico) mei adversarii (quorum Ticini praecipue maximus numerus viger) laudes in ore proprio sordescere" (*Praefatio*, 21).
38. "Eo nanque animo sunt, cum philosophi, tum Sacrarum Literarum professores, ut existiment philosophiae studium peripatheticum praecipue, Sacrae Theologiae plurimum adversari, philosophorumque placita theologorum sanctionibus, salutaribusve Christi praeceptis omni ex parte reluctari" (*Praefatio*, 1).
39. Following on from the text quoted in the previous note, he says: "Horum sententiae quae vulgo probatur dudum subscripsi, faviq[ue] adeo, ut interea puderet pigeretque studiorum meorum" (*Ibid.*).
40. "Etenim si istud donemus, inficiari non possumus philosophiam nihil aliud agere praeterquam decipere, circumvenire, praestigiari, veluti magicis machinamentis siderare homines, ac pro arbitrio (ut rhetores) in candida quod aiunt nigrum vertere, in nigra candidum. Nunquid igitur philosophiae professores rerum causas non doceant, sed tanquam argumentosi homines rerum puritatem ludicris veluti, et calamistris dehonestant, ac in quam libuerit faciem habitumque transformant, ut non quales suapte natura res naturales ac divinae, sed quales voluerint, non fiant quidem, sed cum non sint, esse tamen audientibus appareant?" (*Ibid.*, 1–2).
41. "Proh Deum atque hominum fidem, si philosophus talis tantusque impostor est, qui publice in doctissimorum coetibus profiteri passim permittitur? Quid? Quod quidam ultro obstrepunt idem apud philosophos verum esse, quod in theologia mendacium sit, quasi unius rei multiplex possit esse veritas?" (*Ibid.*, 2).
42. The roots of two quite different tendencies are to be found in the intellectual tradition stemming from Plato. One is the synthetic, metaphysical, dogmatic, and constructive side which developed into Neoplatonism. The other is the critical, negative, antidogmatic, and destructive side that developed into Academic scepticism. See my discussion in *Cicero scepticus* (The Hague, 1972), 51–53, 160.
43. E. N. Tigerstedt, *The Decline and Fall of the Neoplatonic Interpretation of Plato* (Helsinki, 1974).
44. "Quod variis ratiociniis aucupari humana ratio contendit, id lex divina severa quadam maiestate sancit, quo facile liquidove videatur utranque [i.e., philosophiam et theologiam] ad eundem finem dirigi, utrius siquidem finis est divinae essentiae (ut philosophice dixerim) cognitio" (*Praefatio*, 3). Cf. Ficino, *Opera* (Basel, 1561), 668.
45. "Philosophus nanque, cum divino propter contemplationem atque decoro frequenter adhaereat, ob idque divinus ipse decorus, quoad homini possibile est, efficiatur, ea quae in superna illa mente intuetur, ad mores hominum iure optimo et privatim et publice transferat, oportet" (*Praefatio*, 10). Ficino adopts a similar position, for example in the *Quaestiones quinque de mente* in *Opera*, 675–682.
46. "Obstrepant licet sacrarum literarum philosophiaeque professores, ego sum huius sententiae, ut existimem sacrosanctae theologiae praecepta Aristotelis atque Platonis placitis nulla ex parte reluctari, quin etiam conspirare in omnibus" (*Praefatio*, 18).
47. Ficino, *Opera*, 853–854.
48. *Praefatio*, 4.
49. *Ibid.*
50. "Quamobrem cum aliis in rebus, tum hoc in negotio praecipue mihi semper visus est Plato

sapienter laborasse, quod disputationes ubique morales ad bene beateque vivendum institutas proposuerit ad purgandum adolescentum animos. Mox ad naturalia investiganda perexit, hinc ad divina indaganda paulatim ascendit" (*Ibid.*).

51. "Ac cum ex naturalium contemplatione abunde didicerit animam quandam esse harmoniam, pro viribus nititur, ut fortitudinem cum temperantia misceat, harmoniamque in moribus constituat compositioni animae quae harmonia dicitur, si fieri possit, maxime conformem. Quod harmonia quaedam sit animus, coelestique harmoniae aliquando (ut Platonicè dixerim) assuetus, vel illud evidentissimum argumentum esse potest, quod nullum animal praeter hominem rhythmici et harmoniae sensum habet. Quinetiam corpus nostrum teste Platone harmonia quadam consistit: vegetant et harmonia quadam plantarum partes, omnium denique mixtorum temperaturae harmonia vigent, praecipue primum animae instrumentum spiritus. Huiusce rei argumentum est, quod si vindictae cupiditate nonnunquam (ut fit) exarserit, per consonantiam vocum aëream, aërcum spiritum motu penetrantem, praesertim si tanta fuerit consonantia, ut affectum canentis et animam secum transferat: tunc praecipue audientis affectum movet affectu, et animum afficit animo, sensimque mentem in pristinum habitum restituit, iramque propulsat. Hinc sit, ut animus pulchra et consona, propterea quod natura suae conformia sint et cognata, semper desyderet. Hinc nimirum Academici passim inculcant optimum id esse ingenium, quod ex temperantia et fortitudine mixtum sit, utpote docile, memor, ad divina propensum, cumque eiusmodi ingenia recte educata sunt, religionis cultum ab iis in alios proficisci verissimum, civitatisque omnium utilissimum asserunt. Tantum potest in hominum mentibus miscella fortitudinis cum temperantia, quam philosophus ex rerum naturalium divinarumque contemplatione primum inexit" (*Praefatio*, 7-9).
52. "Atque hoc in negotio praecipue Plato mihi semper visus est caeteris praestare, cum de musica passim disserat atque gymnastica, quod magni sint momenti, plurimumque conferant ad fortitudinis temperantiaeque mixtionem consequendam aut conservandam" (*Ibid.*, 9).
53. Further investigation is required to determine the cultural *ambiente* at Pavia during those years. Among those teaching philosophy at Pavia during Camuzio's time are Branda Porro (who was also subjected to abuse by Cardano), Arcangelo Lanfrancconi (a Carmelite), Giulio Ferrari, and Filippo Marchesi (a Franciscan).
54. See C. B. Schmitt, "L'Introduction de la philosophie platonicienne dans l'enseignement des universités à la Renaissance," in *XVF Colloque international de Tours: Platon et Aristote à la Renaissance* (Paris, 1976), 93-104, at 99, and the literature cited there.
55. In addition to the works listed above in notes 13, 23, 25, 27, 34, and 36, there are also the following two published works: (1) *Rationes adductae in articulos duos . . . de sacramento ordinis . . .* (Pavia, 1563) [not seen: Index aureliensis 130, 938] and (2) *Andreae Camutii . . . de nobilitate libri octo hactenus in lucem nusquam editi* (Milan, 1641) [copy used: Florence, Biblioteca nazionale 22. 6. 13]. Besides the manuscript works already mentioned, there are various letters scattered through various collections of manuscripts.
56. E. Cassirer, *Die platonische Renaissance in England und die Schule von Cambridge* (Leipzig-Berlin, 1932), Einleitung (1-5).

### TRIADS AND TRINITY IN THE POETRY OF ROBERT BROWNING

1. A prefatory footnote, also, is essential. I am conscious that, in thus surveying the Browning canon, I have drawn on the wisdom of many critics read over the years whose names will not appear in the ensuing notes. To all such, my gratitude is here expressed. I thank also my colleagues and friends, Thomas J. Collins, Donald S. Hair, Cory Bieman Davies, and Linda Dowler, with all of whom I have conversed, fruitfully from my point of view, during the evolution of this paper.
2. *The Works of Robert Browning*, ed. F. G. Kenyon, Centenary Edition (London, 1912; rpt. New York: Barnes and Noble, 1966). "Pauline," pp. 292, 295. All further line references will be drawn from this edition and incorporated in the text.
3. New York: MacMillan, 1891.

4. Boyd Litzinger, in *Time's Revenges: Browning's Reputation as a Thinker, 1889-1962* (Knoxville: University of Tennessee Press, 1964), documents the decline in Browning's reputation and calls for reassessment.

Jones is answered most directly by Philip Drew in "Henry Jones on Browning's Optimism," *Victorian Poetry* 2 (1964), pp. 29-41. He expands his arguments in *The Poetry of Browning: A Critical Introduction* (London: Methuen, 1970); a long note on p. 186 gives examples of the "incalculable" and misleading influence of Jones' work. Drew's sane discussions are representative of good modern criticism on the issues here raised. He is not directly concerned with triadic or trinitarian formulations.

5. To speak of birth as the "descent" of the soul was commonplace in Plato and his followers, and in ancient Gnosticism; the philosophers usually showed themselves conscious of using metaphor, the Gnostic mythmakers less so. Two brief references: "The Descent of the Soul" in *The Essential Plotinus*, trans. and ed. Elmer J. O'Brien (Toronto: Mentor, 1964), 59-71; Hans Jonas, *The Gnostic Religion* (Boston: Beacon, 1958), pp. 62-64.
6. Christopher Butler, *Number Symbolism* (London: Routledge and Kegan Paul, 1970), p. 3.
7. In notes to a previous essay, "An Eros Manqué: Browning's 'Andrea del Sarto,'" *Studies in English Literature* 10 (Autumn, 1974), pp. 252-254, I cite evidence and confirming opinion concerning Browning's familiarity with the Platonic tradition. More recently, Curtis Dahl and Jennifer L. Brewer have written on "Browning's 'Saul' . . . A Neoplatonic-Hermetic Approach," *Browning Institute Studies* III (1975), pp. 101-118. John Maynard, in *Browning's Youth* (Cambridge: Harvard University Press, 1977), pp. 85-96, describes the encyclopedic nature of Browning's father's library. *Curiosa* and standard works of all kinds, in Greek, Latin, Hebrew, and many modern languages were available, both directly, and as filtered through the elder Browning's retentive memory. Thurman Los Hood, in *Browning's Ancient Sources* (Cambridge: Harvard, 1922), offers exhaustive lists of analogues and sources for specific passages in Browning: Plato, Suetonius, Plutarch, Cicero, and Iamblichus are among those cited. Judith Berlin-Lieberman, in *Robert Browning and Hebraism* (Jerusalem: n.p., 1934) demonstrates Browning's familiarity with rabbinical sources, without being concerned directly with their possible use as vehicle of Neoplatonic commonplaces.
8. A brief description of Hegel's dynamic system is available in most encyclopedias and histories of philosophy: see, for example, *New Encyclopedia of Philosophy*, eds. J. Grooten and G. Jo Steenbergen (New York: Philosophical Library, 1972), pp. 180-183.
9. At the risk of anticipating key arguments in this paper: the process of critical discovery, as the revealing of the desired end, bears a precise analogy to Browning's understanding of the poetic process as his means of reaching towards his Answer.
10. The stages in Browning's development that culminate in the completed "Saul" have been described by such critics as F. E. L. Priestley, Thomas J. Collins, William Whitla, and David Shaw. Notes to my article, "The Ongoing Testament in Browning's 'Saul,'" *University of Toronto Quarterly* 43 (Winter, 1974), pp. 151-168, give particulars.
11. I indicate at this point some fairly recent publications that bear on matters here addressed. H. B. Charlton's "Browning as Poet of Religion," first published in the *Bulletin of the John Rylands Library* (June, 1943), was given fresh currency in 1970 in a Folcroft Library Edition. It all but ignores Jones' adverse charges in providing an outline of Browning's more positive assertions concerning faith, and misses the constant presence of scepticism in the scheme of things. William Whitla's *The Central Truth: The Incarnation in Robert Browning's Poetry* (Toronto: University of Toronto Press, 1963) recognizes the continuing importance of scepticism in Browning, seeing the movement through doubt and the recognition of love to acceptance of the incarnate Christ; but Whitla does not deal with the differences in emphasis I find important between early, central, and late periods, as defined by my awareness of such differences. (His organization is thematic, without, of course, ignoring chronology.) He finds Browning's "trinitarian" position a good deal more readily definable than I do. He equates the Holy Spirit with Knowledge, without underscoring the radical necessity of the act of choice in knowing, itself dependent upon the fruitful scepticism. Norton B. Crowell in *The Triple Soul: Browning's Theory of Knowledge* (University

- of New Mexico Press, 1963) is not as concerned with triadic formulations as his title suggests. He offers, primarily, a series of readings of individual poems that are chosen to demonstrate Browning's view of man's quest for knowledge.
12. In "The Ongoing Testament . . ." I develop more fully the easily recognized evidence that Browning sees himself in a prophetic role.
  13. W. C. DeVane, *A Browning Handbook* (New York: Appleton-Century-Crofts, 1955), p. 55.
  14. F. E. L. Priestley, in "The Ironic Pattern of Browning's *Paracelsus*," *University of Toronto Quarterly* 34 (1964) pp. 68-81, and Collins, in *Robert Browning's Moral-Aesthetic Theory, 1833-55* (Lincoln: University of Nebraska Press, 1967), p. 30, emphasize the degree to which Aprile's aspiration to love "infinitely" misleads Paracelsus at this point. I agree that Aprile's words feed Paracelsus' passion for infinity, but find the Priestley and Collins arguments not at all incompatible with mine, that Paracelsus glimpses the partial truth here that "love" and "power" belong together. For suggestions as to how I will have it both ways, see the paragraph on vertical and horizontal dimensions of the dyadic dilemma on page 194.
  15. C. G. Jung's two essays on Paracelsus, accessible in *The Spirit in Man, Art, and Literature* (Princeton: Bollingen, 1966), give an interesting and concise impression of the life, with enough historical particulars to substantiate Browning's characterization.
  16. Paracelsus, like most Renaissance mages, dabbled in cabalistic lore. Some method is suggested in his madness if we recall the prominence of the occult commonplace "as above, so below" in Cabala with the suggestion therein of a reciprocal dynamic between spiritual and mundane realms. A passage in *Zohar* on the creation of man (ed. G. G. Scholem, New York: Schocken, 1963 pp. 31-33) witnesses to the close interrelationship between upper and lower worlds in rabbinical lore, a devout mystical awareness pushed towards manipulative magic in Renaissance occultism. See also Keith Thomas, *Religion and the Decline of Magic* (Harmondsworth: Penguin, 1971), pp. 264-274.
  17. See note 10, and works therein cited.
  18. Collins, p. 122, points to evidence in the "Essay on Shelley" which implies that the movement of conversion for Browning was essentially complete by 1852, in which case the stanzas in question may have been written at least that long before publication.
  19. They have been anticipated, too, in the luminous water-snakes that provide release for Coleridge's ancient mariner from the stagnation that has bound him.
  20. In stanza xii.
  21. The dissenters' chapel of the speaker's choice should not be too closely identified with the York Street Congregational Chapel attended by the youthful Browning with his mother, which was more pretentious than the one the poem presents. See Maynard, pp. 51-62, and Hoxie N. Fairchild, *Religious Trends in English Poetry IV* (New York: Columbia, 1957), p. 139.
  22. Images from Genesis 2:9 and Revelation 22:2 underlie these words of course. Fallen life itself becomes the median term stretching between primal innocence and *eschaton*.
  23. DeVane, p. 298.
  24. *Enneads* III, 8 (available in O'Brien, 163-175); *Paradise Lost* V, 469-505.
  25. The poem is subtitled "Or, Natural Theology in the Island."
  26. The usage of the term "Molinists," in multiple occurrences throughout *The Ring and the Book*, is curious. Browning clearly intends it to refer to the followers of Miguel de Molinos, who are mentioned only once in the Old Yellow Book that serves as his major source: these "heretics" espoused, in the late seventeenth century, a form of contemplative mysticism known usually as "Molinism," or as "Quietism." "Molinism," in church history, is not regarded as a heresy: it is a legitimate doctrine on the freedom of the will established in the sixteenth century by Luis de Molina. Helen M. Loschky, in "Free Will Versus Determinism in *The Ring and the Book*," *Victorian Poetry* 6 (1968), pp. 333-352, reviews the criticism to that point, and finds as I do, against the majority of earlier discussants, that Browning is not at all confused in his usage. (The thrust of her argument is towards the earlier term, of mine towards both.) Browning's conflation serves to provide appropriate historical coloring to his narrative, a purpose for which "Molinism" would have done at some strain to the metrics; the term serves, through evidences that a mystical heresy is being indicated, to point to the apprehensions of eternal truth by inner means while avoiding the term "Quietism" which would be quite foreign to the active encounters with spiritual truth Browning is interested in presenting; and it serves to suggest the dimensions of willful choice that are central to Browning's own evolved theology. It is doubtful that he would have expected many readers to catch the play upon terminology, but in a poet whose applications of erudition impressed his incompatible contemporary Swinburne with their precision (see Clyde de L. Ryals, *Browning's Later Poetry*, Ithaca: Cornell, 1975, p. 245), such density in the function of obscure detail is not surprising.
  27. See F. E. L. Priestley, "A Reading of 'La Saisiaz,'" *University of Toronto Quarterly* 25 (1955), pp. 47-59; and Cory Bieman Davies, "From Knowledge to Belief in *La Saisiaz: The Two Poets of Croisic*," *Studies in Browning and his Circle* 6 (1978), pp. 7-24.
  28. Donald S. Hair, in "Exploring Asolando," *Browning Society Notes* 8 (1978), pp. 3-6, finds in the volume's subtitle "Fancies and Facts" a useful focus for ranging through the volume.
  29. DeVane, p. 553.
  30. Ryals, p. 238.
  31. John Donne, "A Hymn to God my God, in my Sickness," available in many anthologies as well as in *John Donne, The Complete English Poems*, ed. A. J. Smith (Harmondsworth: Penguin, 1971) p. 347.
  32. "A Death in the Desert," I, 101.

#### THE CHRISTIAN PLATONISM OF C. S. LEWIS, J. R. R. TOLKIEN, AND CHARLES WILLIAMS

1. *Descent of the Dove* (Grand Rapids, Mich.: William B. Eerdmans Publishing Co., 1974) copyright date is 1939.
2. *Surprised by Joy* (London, England: Fontana Books, 1959) copyright date is 1955, chapters XIII, XIV, and XV.
3. *Taliessin Through Logres* in Charles Williams and C. S. Lewis, *Taliessin Through Logres, The Region of the Summer Stars, and Arthurian Torso* (Grand Rapids, Mich.: Eerdmans Publishing Co., 1974) copyright date of *Taliessin Through Logres* is 1938. Six of Williams' novels are currently published by Eerdmans Publishing Co.: *Shadows of Ecstasy*, *War in Heaven*, *Many Dimensions*, *The Greater Trumps*, *The Place of the Lion*, and *Descent into Hell*. The seventh novel, *All Hallows' Eve*, is published by Noonday Press.
4. "On Fairy Stories" in *The Tolkien Reader* (New York: Ballantine Books, 1966).
5. *Ibid.*, p. 72.
6. *The Chronicles of Narnia* are currently published by Collier Books: *The Lion*, *The Witch*, and *The Wardrobe*; *Prince Caspian*; *The Voyage of the Dawn Treader*; *The Silver Chair*; *The Horse and His Boy*; *The Magician's Nephew*; and *The Last Battle*.
7. *The Last Battle*, p. 170.
8. p. 73.
9. *Essays Presented to Charles Williams*, ed. C. S. Lewis (Eerdmans Publishing Co., 1966), p. 8.
10. *Ibid.*, p. 9.
11. *The Lord of the Rings* consists of *The Fellowship of the Ring*, *The Two Towers*, and *The Return of the King* (New York: Ballantine Books, 1965) copyright date is 1963.
12. *The Silmarillion* (London, England: George, Allen, and Unwin, 1977).
13. The Trilogy is currently published by Macmillan: *Out of the Silent Planet*; *Perelandra*; and *That Hideous Strength*. The quotation is from *Perelandra*, p. 199.
14. p. 195.
15. *The Place of the Lion*, p. 116.
16. *Sophist* 248C in the *Dialogues of Plato*, trans. B. Jowett (New York: Random House, 1892).
17. *Ibid.*, p. 190.
18. *Surprised by Joy*, chap. XI. Also, *The Abolition of Man* (New York: MacMillan, 1947), pp. 86-90.
19. *The Abolition of Man*, loc. cit.

20. *Out of the Silent Planet*, p. 131.
21. p. 189.
22. Symposium 201D–212A in *The Dialogues of Plato*, trans. B. Jowett.
23. *The Voyage of the Dawn Treader*, chap. VII.
24. In my opinion, Williams' desire to express this philosophico-religious position in literary art is firmly within the Platonist tradition. Here the beauty of the material is expressed in the beauty of poetry.
25. *The Place of the Lion*, chap. XI.
26. chap. 18.
27. *The Voyage of the Dawn Treader*, p. 184.
28. p. 206.
29. *That Hideous Strength*, chap. XVII.
30. C. S. Lewis, *The Four Loves* (New York: Harcourt Brace and World, 1960).
31. *The Lion, The Witch, and The Wardrobe*, chap. X.
32. *The Place of the Lion*, chap. XI.
33. *The Last Battle*, chap. XV.

### NEGATIVE THEOLOGY, MYTH, AND INCARNATION

1. The Academic rather than the Pyrrhonian is, I think, the strongest sceptical element in our tradition. It differs from the Pyrrhonian in admitting degrees of probability, and so leaving room for enthusiasm, and even a degree of commitment (though not absolute commitment). See the generally excellent statement of the difference between the two traditions by the Pyrrhonian Sextus Empiricus (*Outlines of Pyrrhonism* 226–231); though it does not seem to be true that, as Sextus asserts, the Academics fell into the elementary mistake of stating dogmatically that they knew that they did not know, or that Carneades in any way illegitimately smuggled certainty as an ultimate norm into his theory of probability; see A. A. Long, *Hellenistic Philosophy* (London, 1974) pp. 94–99.
2. J. Trouillard, "Valeur critique de la mystique Plotinienne" in *Revue philosophique de Louvain* 59 (August, 1961) pp. 431–434; "Raison et Mystique chez Plotin" in *Revue des études augustiniennes* 20 (1974) pp. 3–14; "Théologie négative et autoconstitution psychique chez les néoplatoniciens" in *Savoir, faire, espérer: les limites de la raison* (Publications des Facultés Universitaires Saint-Louis, Brussels, 1976) pp. 307–321; A. H. Armstrong "The Escape of the One" in *Studia Patristica XIII* (Berlin, 1975) pp. 77–89; "Negative Theology" in *Downside Review* vol 95, no 320 (July, 1977) pp. 176–189.
3. "Of course he [Plato] used metaphor, and metaphor is basic: how basic is the most basic philosophical question," Iris Murdoch, *The Fire and the Sun* (Oxford, 1977) p. 88.
4. See Christopher Stead, *Divine Substance* (Oxford, 1977) ch. x, *Conclusion*. Plotinus uses a great deal of positive "substance" language about God, in the way described, in VI 8 [39] where in my view, which I propose to develop in another paper, he is arguing, patiently though not without irritation, with a Christian theist much concerned about the free will of God. But the Neoplatonic work that uses substance and knowledge-language most strikingly (and quite coherently) of God in a context of extremely radical negative theology is the anonymous commentary on the *Parmenides* so admirably studied and edited by P. Hadot in his *Porphyre et Victorinus* (Paris, 1968; text of the Commentary in vol. II), especially IV and V (pp. 74–83, Hadot: fol. 94<sup>v</sup> and fol. 64<sup>v</sup>). It is not quite as certain as Hadot supposes that the commentary is by Porphyry. I hope that my pupil Dr. G. Adolf will publish his reasons for questioning the identification of the author. But it is a most original Neoplatonic work, of great importance for the development of negative theology.
5. In "Théologie négative et autoconstitution psychique . . ." (see note 2) pp. 312–313: "Dès lors, la notion de 'Dieu caché' change de sens. Le Dieu de saint Augustin et de saint Thomas est caché parce que, étant la plénitude infinie de l'intelligibilité, sa trop grande clarté nous éblouit, comme le soleil regardé en face offusque nos yeux. L'Un néoplatonicien est nocturne parce qu'il refuse tout contenu intelligible et toute pensée. Il est au-delà l'ordre de connaissance. Il n'a donc pas de secret, c'est-à-dire d'essence qui se déroberait au regard. Cela ne veut pas dire qu'il ne peut se communiquer et qu'il reste muré dans une transcendance inaccessible." What follows, on the immanent interior transcendence of the One as an "inexhaustible starting-point," always before, never attained by, thought is very relevant to a proper understanding of what I mean by "myth" in its extended and positive sense.
6. For my curious use of "icon," cf. "Negative Theology" (see note 2) pp. 188–189.
7. *Divine Names* 4, 13 (712A–B).
8. In "Le Merveilleux dans la vie et la pensée de Proclus," in *Revue philosophique de la France et de l'Etranger* (1971) pp. 439–452; section 3 "La fonction de l'imagination," pp. 447–452. The principal source for the views of Proclus on poetic myth is in *Rempublican* I 368–407, 69–205 Kroll, especially 368–378, 71–86 Kroll.
9. *The Fire and the Sun* (see note 3), especially pp. 69–89.
10. I refer particularly to his "Does Christology Rest on a Mistake" in *Religious Studies* 6, 1, (March, 1970) pp. 69–76 and his second essay in *The Myth of God Incarnate* (London, 1977) "Myth in Theology," pp. 148–166. I also find very satisfying his treatment, both historical and theological, of a most important and difficult theme in the "myth," that of resurrection, in the appendix to his *Remaking of Christian Doctrine* (London, 1974) pp. 125–146. I find this much more satisfying than the summary dismissal of the resurrection by both sides in the older controversy between Jaspers and Bultmann (originally published in book form as *Die Frage der Entmythologisierung*; English translation (*Myth and Christianity*) first printed in paperback New York, 1958 and frequently reprinted since). In many ways, however, my position is fairly close to that of Jaspers', and I agree with much in his defense of liberalism and his appreciation of the religious value of myth.
11. I have in mind particularly his essay in *The Myth of God Incarnate* (see note 10) "The Christ of Christendom," pp. 133–147, and his numerous and vigorous defenses of his position since, generally on radio or television.
12. On the historical Jesus I am at present in general agreement with the position of Dennis Nineham in his somewhat devastating *Epilogue* (pp. 186–204) to *The Myth of God Incarnate* (see note 10), which shows clearly what very awkward questions a serious critical study of the evidence can raise.
13. Cf. Gilbert Murray *Greek Studies*, pp. 66f and E. R. Dodds, *The Greeks and the Irrational* (University of California Press, 1951) pp. 179–180.
14. I have discovered this by experience in dialogue with an Indian and an Isma'ili friend. If they spoke the language of their own traditions and I spoke the language of Neoplatonism, we understood each other without much need of interpretation. P. Hadot, in his profound interpretation of Hellenic philosophy as a whole, *Exercices Spirituels* (*Annuaire de l'École Pratique des Hautes Études*, 5<sup>e</sup> Section, T. LXXXIV, pp. 25–70) has demonstrated that we have in our own Western tradition a rich and varied store of the sort of wisdom for which many people now look to the East.
15. In *The Origins of Christology* (Cambridge, 1977). The excellent hypotheses—clearly presented as such—of the chapters devoted to a scholarly consideration of the New Testament evidence do not, unfortunately, seem to me, even if they are taken as certain conclusions from that evidence, to support sufficiently the apologetic conclusion.
16. Those of others will, of course, be different. It is perfectly possible to make a "Jesus of scholarship," even before he goes out of fashion, the historical foundation of a myth; and for very many people a Semitic rather than a Hellenic form of myth, incarnational or nonincarnational, Jewish, Christian, or Muslim, will be the right and necessary one. My own reasons for especially disliking un-Hellenic or de-Hellenized Western Christian or post-Christian biblical myths would take too long to explain adequately: it would be necessary to deal with such subjects as the disjunctiveness of biblical monotheism, the "meaning of history," and the harm done in real history by the idea of an elect or chosen people in its various forms. (Of course, in many of them the gentiles of the myth will include or be Jews).
17. My belief that what I had noticed in Dionysius was really there was strengthened by discovering that Dr. Bernhard Brons had noticed the same phenomena and forcibly described them in his

scholarly studies of the Dionysian writings. *Gott und die Seienden* (Göttingen, 1976) and "Pronoia und das Verhältnis von Metaphysik und Geschichte bei Dionysius Areopagita" in *Freiburger Zeitschrift für Philosophie und Theologie* 24 (1977) 1-2, pp. 165-186. Of course, as the theological position of Dr. Brons seems to be almost the exact opposite of my own, he notes these characteristics of Dionysian thought with disapproval.

18. It has often been observed that the Fathers of the Alexandrian tradition, in particular, seem more interested in the "incarnability" of the Logos and the universal theandric union of God with humanity as a whole than in the particular historic Incarnation, and something of this persists in Greek-Christian theology and theology influenced by it in the West. E. P. Meijering's "Cyril of Alexandria on the Platonists and the Trinity" in *God Being History* (Amsterdam-Oxford-New York, 1975) pp. 114-127 is of much interest in this connection.
19. For the way in which Dionysius speaks of the Trinity see, e.g., *Celestial Hierarchy* VII 4 (212C); *Ecclesiastical Hierarchy* I 3 (373C-D); *Divine Names* I 4 (592A); 5 (593B); II 7 (645B-C); III 1 (680B); XIII 3 (980D-981A); *Mystical Theology* III (1033A) and V (1048A; cf. Letter II). On the way in which Dionysius, as is generally supposed, adapts Athenian Neoplatonism to Christian purposes by a certain conflation of the Neoplatonic One and the Neoplatonic *Nous*, see the most recent discussion by S. Gersh *From Iamblichus to Eriugena* (Leiden, 1978). It is agreed that Dionysius is not a "hierarchical" thinker in the sense of Proclus (cf. my "Negative Theology"—see note 2—pp. 181-184) and that he uses very positive language about God's being, knowledge and action while strongly maintaining an extreme apophatic theology. But there are unsolved, and possibly insoluble, questions as to the precise relative importance of the contributions made to this Dionysian Christian Platonism by the distinctively Christian side of the theology which he inherited (especially from the Cappadocians), by the predominantly pre-Plotinian Platonism which was the philosophy most used by fourth-century theologians, and, possibly, by a return, which might have been deliberate, to a more Plotinian-Porphyrian kind of Neoplatonism (see p. 217 and note 4).
20. The principal Christological passage is *Divine Names* II 9-10 (648A-649A); cf. XI 1-2, 948D-953B where *Eirene* and "Jesus" or "Christ" seem to be interchangeable divine names.
21. In view of his great influence, the universal sweep of his vision of creation and salvation, and his intense devotion to the Incarnate Lord (who is much more than a symbol to him, however allegorically he interprets the details of his earthly life), Origen deserves particularly careful investigation on this point. And I do not wish to lump together the great thinkers, from Maximus onwards, who have more or less followed the Dionysian tradition under any superficial generalization.
22. See my "Man in the Cosmos" in *Romanitas et Christianitas* (Amsterdam-London, 1973) pp. 5-14.
23. The main Platonic authority for this conviction for later Platonists has of course been *Timaeus* 29D-30B, though it pervades the theology of the *Dialogues*. My way of putting it is a summary paraphrase of Proclus, *Elements of Theology*, Proposition 122 (especially p. 128, lines 19-21 Dodds).

*Note:* I had written this paper before the publication of Dr. E. P. Meijering's excellent book, *Theologische Urteile über die Dogmengeschichte: Ritschl's Einfluss auf von Harnack* (Leiden, 1978). This does a very great deal to clarify the nature, origin, and much of the development of what I have described as "biblical" theology, and in the author's final critique of Harnack suggests approaches to the Bible, Greek philosophy, and the theology of the Christian Fathers which, if they were widely followed, might lead to the transformation rather than the disintegration of our Inherited Conglomerate.

## WHY CHRISTIANS SHOULD BE PLATONISTS

1. On Absolute theory, see also my *Ascent to the Absolute* (New York, 1970), *The Discipline of the Cave* (New York, 1966) and *The Transcendence of the Cave* (New York, 1967).

## PREFACE

R. Baine Harris

All philosophers are children of their age and primarily speak to the intellectual needs of their constituencies, but the really great ones somehow manage to transcend their own time. They think more deeply and provide a more profound analysis of the issues and produce a new, richer, and more consistent synthesis of their thought than do lesser philosophers. They break the bounds of the concerns of their day by focusing upon those perennial questions that people in all cultures ask when they philosophize, questions such as 'What is really real?', 'What is the true nature of man?', 'How do we know and how do we know we know?', 'Will we survive our death?', 'Is there a divine source of the world, and if so, how are we related to it?' 'What responsibilities do we have to ourselves, to the earth, and to all the social groups that live on it?', and similar questions. On the basis of his responses to all of these questions Plotinus, an Egyptian who taught philosophy in Rome in the middle of the Third Century AD, certainly qualifies as a great philosopher, and has been so regarded by major thinkers in the West in various centuries since his time, including some in our own century.

Rome in the middle of the Third Century AD was a place that had an intellectual milieu quite similar to the one in our time. By then Rome itself had been intellectually invaded by the cultures of those countries her armies had invaded during the past six centuries. Old established ideas and customs were being challenged by new ways of thinking. There was such a profusion of them that there was considerable confusion among both the general public and the philosophers concerning what ought to be believed. A parallel situation exists in our time in most every country of the world. Old established cultures are being challenged by the intrusion of new ideas brought in by numerous visitors to their shores, and from foreign radio, movies, television and the Internet. Just as in Third Century Rome there is now much confusion concerning what ought to be believed.

Like Confucius, Plotinus thought of himself as only a conservative and a traditionalist who sought to speak to the intellectual disorder of his time by appealing to the unified thought of certain earlier philosophers. More specifically, he thought of himself as a Platonist who sought to bring the unified philosophy of a Greek philosopher who had lived in Athens six

centuries earlier to bear upon the intellectual issues that were then facing Roman culture. Thus, in his old age and after many years of teaching and thinking, he synthesized a new version of Platonism, which he presented in his lectures in his academy in Rome. He only wrote one small book. Actually, he did not write the book himself, but allowed a colleague of his, Porphyry, to take down notes from his lectures and arrange them into a series of essays in nine divisions with six essays each, a work which later became known as the *Enneads*, or "the Nines."

Whether or not his version of Platonism is "true Platonism" is an issue that is still being debated by contemporary Platonic scholars; but it was the version that came to have the most historical importance in the West. His version is old in the sense that it follows the basic assertions of Plato, but new in the sense that it takes into consideration Aristotle's criticisms of Plato and makes some adjustments for them in a more logically organized consistent system of thought, similar in style to Aristotle's way of philosophizing. Thus, he actually produced an Aristotelianized version of Platonism or Platonized version of Aristotelianism, so much so that German scholars in the late Nineteenth Century dubbed him and his imitators in later centuries as "Neoplatonists." Regardless of what he is now labeled, Plotinus would likely have not thought of himself as a new Platonist but merely as an old one who merely formulated Platonism into a more organized consistent form.

The term "neoplatonist," however, needs some further consideration. None of the later Neoplatonists, including all of the teachers associated with him in his academy, chose to accept Plotinus' metaphysical system exactly as he presented it. Even his "Boswell," Porphyry, his editor, promoter, and biographer, in his own version of Neoplatonism denied five of Plotinus' logical categories and substituted five of Aristotle's categories in their place, and thus produced another version of Neoplatonism that for many centuries was more influential than the version given in the *Enneads*. Although all his followers may be loosely called "Neoplatonists," some of them, and especially the teachers then associated with him, simply made their own versions of Platonism, versions that are similar to his, while others of them, especially in later centuries, revised his system with major emendations. Still others accepted only certain parts of his epistemology, metaphysics, psychology, etc. mixing new ideas and new reformulations with it. The latter raises the question how much of the thought of Plotinus must be incorporated into a new formulation of it in order for it to be labeled "Neoplatonic."

Thus, we must conclude that the term "Neoplatonist" does not have a very exact meaning. In the strictest sense, there probably has never been another pure Plotinian since Plotinus; but, nevertheless, elements of his thought, and even new versions of his metaphysics, have appeared in various degrees in the thought of various philosophers, theologians, artists, and poets in various venues in the West in various centuries since he first formulated it in Rome. In addition, philosophical formulations similar to his have appeared in the thought of certain philosophers in India, both before and after the Third Century, AD. Although these have not been historically labeled as Neoplatonic, some of them have a remarkable affinity with his views. To the writer's knowledge, there have been no efforts to make a new reformulation of his metaphysics in modern times, but his influence has been much greater than it might at first appear to be due to elements of his thought that have been embedded in the thought of other writers and scholars who are still widely read. Numerous Christian, Jewish, Islamic, and "pagan" philosophers, theologians, artists, and poets throughout the centuries of Western Intellectual History have gone to his *Enneads* almost cafeteria style and picked out certain elements of them to be reused in their own new formulations. In this way he has actually been one of the most influential of all the Roman thinkers who helped to shape what we now term "Western Civilization."

This explanation is relevant to a consideration of the nature of the forty essays in the two volumes of this book. Most of them were first given in an earlier form at a four day international congress of the International Society for Neoplatonic Studies held in Vanderbilt University in Nashville, Tennessee held in May of 1995, with some 130 scholars in attendance. The purpose of the conference was to illustrate that some elements of the thought of Plotinus survived to be of some importance in the Twentieth Century and may be viable for the future. As its name suggests, this society is a society for the *study* of Neoplatonism rather than a fellowship of Neoplatonic believers, and as such, includes members who vary in their degree of academic involvement in the subject. For some it is their primary field for teaching and research, while others are interested in it only as it may be related to some other major concern. In like manner, its members also vary in the degree to which they sanction Neoplatonism as a philosophy. Some see it as an important element in understanding the history of Western Thought, but judge it to have only antiquarian value, while others see some elements of it to be quite viable for modern times. The various essays in these two volumes reflect the same sentiments. They are not so much apologies for Neoplatonism as they are evaluations

of it, both as a historical phenomenon, and as a philosophy and a way of philosophizing that still can speak to the intellectual needs of modern man. Included among them are essays by some of the major recent noted authorities on Neoplatonism, including those by John Anton, Leo Sweeney, A.H. Armstrong, Werner Beierwaltes, and John N. Findlay. Part One contains essays that relate Neoplatonism in some way to Contemporary Science and Contemporary Philosophy while those in Part Two relate it to Contemporary Social Theory, Contemporary Aesthetics, and Contemporary Spirituality.

Finally, as editor I wish to express my appreciation to Professor John Lachs, Director for the Center for Neoplatonic Studies at Vanderbilt University for hosting and co-directing the 1995 ISNS conference and for the scores of persons, ISNS members and otherwise, involved in the production of this book.

Old Dominion University

## ACKNOWLEDGEMENTS

Appreciation is expressed to Dr. Patrick Drinan, Dean of the College of Arts and Sciences of the University of San Diego for arranging for the production of the final camera ready copy of these two volumes, and to Vivian Holland of its manuscript production staff for turning the manuscripts into book form. Kudos also go to Dr. Michael Wagner, Professor of Philosophy of the University of San Diego for managing the entire project and for serving as copy editor.

# Science and the Great Chain of Being

Huston Smith

I toyed with titling this paper "Science and Neoplatonism," but because I will be making few explicit references to Plato and his successors, I have chosen the Great Chain of Being as a more general designation for the hierarchical ontology that ascends from lesser existences through intermediate planes up to the *ens perfectissimum* at its top. Arthur Lovejoy said that most educated persons everywhere accepted this groundplan of the universe without question down to late in the eighteenth century,<sup>1</sup> and Ken Wilber has added that belief in it has been "so overwhelmingly widespread that it is either the single greatest intellectual error every to appear in human history—an error so colossally widespread as to literally stagger the mind—or it is the most accurate reflection of reality yet to appear."<sup>2</sup> My object is to match it with the scientific world view that in the eighteenth century replaced the Great Chain of Being (hereafter the GCB) as the presiding ethos in the West. I want to consider how they do and do not mesh.

## I

As mine is the opening presentation in this conference, it seems in order to direct a few words to the theme of our conference as a whole, "Neoplatonism and Contemporary Thought," before I turn to my specific topic. Neoplatonism—I shall be using that word and the Great Chain of Being interchangeably—is a hierarchical metaphysics, and few words are in less favor today than those two, "metaphysics" and "hierarchy." So I feel we need to begin our conference by manning the barricades and insisting that they are respectable words.

Regarding metaphysics, I recently heard a theologian tell of a tour he led to the main geographical centers of the Protestant Reformation. The participants were a select group of well-informed Christians. They were keenly interested in, and knew a lot about, Wittenburg and Guttenburg, Luther's Ninety-five Theses and his plan of salvation. My informant was surprised, therefore, to find that from his point of view his tour members missed the main point. They were not aware that Luther had a world view, a theological system that he thought spanned everything—all human life and the universe as well. They thought in terms of individual statements—justification by faith, the priesthood of all believers, and the like. These isolated doctrines they held important, and they gave them their wholehearted assent. But not only did they not have what Calvin called "the Christian world and life view." They were hardly aware that such a thing existed, much less might be important if not essential. This marks a change, my informant concluded. Whereas earlier in this century Christians of many denominations vigorously opposed Darwinism as having naturalistic and atheistic implications, the situation today is different. It is not so much that most Christians have been persuaded that evolution is true and can be reconciled with the truths of Christianity. The two have been compartmentalized, so that not only do they not conflict. They don't even seem to impinge on each other.

I relate this report as providing an instance of the indifference to world views that characterizes not just theology but our ethos as a whole today. At bottom the indifference derives from an incomprehension of what world views are and can contribute to life, and we have to admit that philosophy in our century has furthered that incomprehension. If we follow Jean-Francois Lyotard in defining postmodernism as "incredulity toward metanarratives," twentieth century philosophers have fostered that incredulity. There are three kinds of postmodernism, three degrees of it we might say. *Minimal* postmodernism contents itself with reporting that we have no world view today, none that remotely approaches consensus. *Mainline* postmodernism goes on to argue for the permanence of this condition. Never again will we have a believable world view; we know too well how little we can know. Lastly, *Hardcore* postmodernism adds to this contention, "good riddance."

Metanarratives totalize, and in so doing marginalize minorities. They are oppressive power-plays, so we are better off without them.

What do we say to this three-pronged attack on metaphysics? We can say that each prong voices a half-truth, but not the full truth,<sup>3</sup> while adding what Jacques Maritain said a half century ago; namely, that "a loss or weakening of the metaphysical spirit is an incalculable damage for the general order of intelligence and human affairs."<sup>4</sup> If we are to say more than that, I so often find myself agreeing with the critics of metaphysics if metaphysics is what they say it is, that I feel the need to cut back behind technical definitions to common sense understandings of the project.

Claude Levi-Strauss tells us that one of the differences between mythic and scientific thinking is that myth-makers think that you don't understand anything unless you understand everything; and when we think of the way context controls meaning and peripheral vision affects focal vision, I think we can say that those myth-makers, our ancestors, were on the right track. Their insight can be expanded as follows: Minds require *ecoches* as much as organisms do, and the mind's *ecoch* is its world view, its sense of the whole of things, however much or little that sense is articulated. Short of madness there has to be *some* fit between the two, and we constantly try to improve it. Signs of a poor fit are the sense of meaninglessness, alienation, and in acute cases anxiety that postmodernity knows so well. The proof of a good fit is that life and the world make sense. When the fit feels perfect, the energies of the cosmos pour into the believer in startling degree. She knows that she belongs, and this produces an inner wholeness that is strong for being consonant with the wholeness of the All.

As for hierarchies, relentless unnuanced assaults from what Frederick Crews calls the eclectic left have all but wrecked this once noble and still etymologically perfect word (in which we in this Society have a vested interest, we might add, it having been coined by one of our own number, Dionysius). I say etymologically perfect word, because I know no other single word that joins the two virtues—holiness, *hieros*; and sovereign power, *arkhes*—which, conjoined, announce the central religious claim. For as William James put the matter, "religion says that the best things are the more eternal things, the things in the universe that throw the last stone, so to speak, and say the final word."<sup>5</sup>

Three years ago Judith Plaskow, the feminist contributor to the journal *Tikkun*, wrote an essay titled "What's Wrong with Hierarchies."<sup>6</sup> It said important things about the dangers of hierarchies, but it was so unadmittedly one-sided that it wrung from me a rejoinder titled "Is Anything Right about Hierarchies?" A graduate student who read my piece said, "They will agree with you, but they won't print it because it doesn't serve their political agenda."

What I said in my rejoinder was that, apart from the obvious facts: first, that we live in a hierarchic universe (or holarchic universe as Arthur Koestler preferred to say) wherein gradations of size, power, and complexity confront us at every turn; and second, that the social world (animal as well as human) couldn't last a week without accepted chains of command—aside from these two obvious facts the decisive point is that hierarchies can be empowering as well as oppressive. A loving family with small children is an example of an empowering hierarchy, as is a well-run classroom. The definitive example of a benevolent hierarchy is God's relation to the world and its creatures. In Christian idiom, "God became man that man might become God."

With metaphysics and hierarchies reaffirmed, I turn now to science where I will begin by stating my strategy for relating it to the Great Chain of Being.

## II

I do not think we can get to the Great Chain of Being through science. But if we start with the GCB there is much in science that can encourage us, shoring up our conviction that it is true. Looking at the findings of science through Neoplatonic eyes, we often find ourselves exclaiming, "Why, of course! This is what we might expect in a world that in its entirety, metaphysically as well as physically, is hierarchically arranged." Science doesn't prove the GCB. It's rather that its findings symbolize it. Approached from the Neoplatonic angle, they deflect our gaze in its direction. If there are sermons in stones and Allah did not disdain to use even a gnat for a symbol, may not science too have symbolic possibilities?

This brings me to the heart of my paper where I shall target five scientific findings that have Neoplatonic "feel" to them.

## III

1. Science finds that its part of the whole—the part it deals with, the physical, material universe—carries the hierarchical signature of the whole itself.

Mirroring the Neoplatonic metaphysical hierarchy—which in Plotinus's scheme descends from the One, through Nous, then Soul, to Matter—science finds that on the rung of the hierarchy it deals with, matter, the hierarchical pattern of the whole reappears. As Stephen Jay Gould puts the matter, "nature is organized as a hierarchy—genes in organisms, organisms in populations, and populations in species."<sup>7</sup> Beginning with size, the picture expands from the micro-world of quantum physics, though the macro-world our senses register, to the mega-world of the astronomers. And there are levels of complexity as well. Aristotle's mineral, plant, animal, and rational kingdoms name them in one way, and the academic disciplines of physics, chemistry, biology, and psychology refine the list. Here as everywhere a level is defined by two things. First, it has a distinctive population; physicists deal with particles but not with chemical compounds or biological cells. Second, each population is governed by its own distinctive laws. Newton's laws of motions do not hold for Brownian movements.

I mentioned that Arthur Koestler preferred "holarchy" to "hierarchy." This has the advantage of avoiding the coercive connotations that have been foisted on the word "hierarchy," while at the same time implying, accurately, that complex objects surround and contain simpler ones. The obvious model for a hierarchy is a ladder of ascent, or a chain composed of links of decreasing size; whereas holarchies suggest concentric circles in which atoms are inside molecules, genes are within organisms, and so on. There is a trade-off, however. Among spatial metaphors it is verticality—the vertical axis—that monitors worth, as phrases like "superior intelligence" and "the higher things of life" attest. In science, where questions of values are secondary if they appear at all, holarchy is clearly the better word, whereas in metaphysics hierarchy has the edge for keeping the qualitative issue central.

2. Only seemingly does science invert the Neoplatonic hierarchy.

The preceding point—that the physical universe retains (holographically, we might say) the hierarchical structure of the

whole in its part; "as above, so below," as the hermeticists used to say—seems obvious. But there appears to be a glaring difference between the hierarchies of science and the Great Chain of Being. In the latter, the less derives from the more, whereas science shows the more as deriving from the less.

Or does science show this?

In popular understanding, it does. Dramatically obvious in biology where life begins in slime and ends in intelligence, the sequence seems to apply across the board—from cosmogony (where molecules arrive after atoms) all the way to developmental psychology where maturation takes time. But interesting things have been happening in our century.

Even in classical physics, order comes first and is the "more" that precedes the dissipations of entropy. (I don't think Ilya Prigogine's work retires the second law of thermodynamics. Time will tell.) Be that as it may, 20th century science carries the issue of "less from more" beyond the question of entropy.

Plotinus speaks of the fall of soul into matter, and that fall can be given a scientific reading. In Neoplatonism the fall occurs because, out of its generosity the One veils itself progressively to allow the Many to appear. But 'veils itself' is only a metaphor. What actually goes on in the veiling? Science answers as follows: Photons are the bridge from the immaterial to the material. (The immaterial as such will be the topic of my next, third, point.) Photons pump power into the spatio-temporal world, but are not themselves subject to space and time. A photon that reaches the earth light years after it left Sirius arrives with the same energy it had when it left home. Time exacts no toll from it; how could it when all clocks stop at the speed of light? The nuclear particles that photons produce *are* subject to time, but not to space, for no definite position can be assigned to them. They are definitely material, though, in having rest mass and charge, which photons lack. Atoms, for their part, are even more fallen, even more material, for being locked into both space *and* time. Still, they are not as "fallen" as molecules are, for atoms are free to absorb and release energy which molecules—almost completely imprisoned in the determinism of our macro-, inanimate world—cannot. (I say *almost* completely imprisoned, for molecules *can* become excited, but the conditions are unusual.)<sup>8</sup>

You get my point. Science *seems* to show that the more derives from the less, but when we look carefully, this "less" derives at every step from what is demonstrably greater in power, and seemingly in freedom as well.

When science bumps into places where the less *seems* to produce the more—life from non-life; animals from vegetables, language where none previously existed—it explains the progressions with a word, emergence, which actually has no explanatory power whatsoever. To say that an attribute emerges *describes* what happens, but doesn't explain what happens. I am surprised at how many philosophers, even, fail to notice this. They join the scientists in trying to cover the nakedness of emergence—as-an-explanatory-concept by covering it with metaphors. The standard one is water. Neither hydrogen nor oxygen are wet, but  $H_2O$  is, which is taken to prove that a new ontological category has been produced. But wetness is a subjective experience, as is dryness, the presumed state of molecules in isolation. Chemically speaking,  $H_2O$  isn't wet. It is simply molecules configured differently from the way they were before hydrogen and oxygen combined. Subjectively speaking, dryness changes into wetness; chemically speaking  $H + H + O$  changes into  $H_2O$ . No new category of being—ontological category—has emerged.

3. Science now concedes that Reality is not exclusively material. I shall be using the words material and visible interchangeably and will define the visible as that which impacts our physical senses, with or without the help of instruments such as telescopes and electron-microscopes.

In the Great Chain of Being matter is an island in the sea of sentience which in itself isn't material. Modern science reverses that picture. For science, sentience exists only (as far as we know) on our planet, and on that planet only in the stream of organic life that inhabits it; so sentience (or consciousness) is the island speck in the fifteen-billion-light-years-across sea of dead matter that envelopes it. Hardcore materialists and behaviorists do not acknowledge that that island exists.

Since the demise of positivism things have changed markedly on this front. It is a confusing topic, for matter and energy are primitive terms in science and cannot be precisely defined, which makes it difficult to define their opposites, the invisible and

immaterial. Still, it is obvious that invisibles occupy a larger and more respected place in science than they previously did.

A mere catalogue must suffice.

a) Whatever preceded the Big Bang is invisible if not immaterial, for what we recognize as matter derives entirely from it.

b) Dark matter, which is known only by the gravitational pull it exerts on detectable matter, is invisible for eluding even the most sensitive scientific instruments. Scientists call it matter because that's all they know that exerts gravitational pull, but for all they know about what dark matter *is*, it might just as well be Aristotle's Unmoved Mover; Stephen Hawking refers to it as "absolute elsewhere." Be that as it may, the entire universe is now calculated to consist almost entirely of this invisible X, for the current recipe for the universe reads, "70 parts cold dark matter, about 30 parts hot dark matter, and just a pinch for all the rest."<sup>9</sup>

c) Dark matter may eventually become visible through improved detection devices—the issue is still up in the air—but no scientist expects that the wave packets (from whose collapse particles derive) will ever be seen.

d) What about psychosomatic medicine? From the common sense (and even medical) point of view this important development of the last half-century looks like a clear case where science now takes invisibles seriously, for no one has ever seen a thought or an emotion, yet demonstrably they can affect the body's immune system. In ordinary language, stress creates ulcers, but in philosophy this whole issue remains ambiguous because mainstream philosophers of mind are epiphenomenalists (John Searle) where they are not rank materialists (Daniel Dennett); dualists like Karl Popper and John Eccles are out of fashion. So even where the mainliners concede that thoughts are not material, they continue to assume that they derive from their neurological underpinnings. By this account, ulcers are caused by neurological disturbances in the brain which we *experience* as stress, not that experience itself. "Mental materialism is back, with a vengeance. It is not only back, but back in an unapologetic, out-of-the-closet, almost exhibitionistic form. This later incarnation might be called 'exuberant materialism.'"<sup>10</sup> Given this neuroscientific triumphalism, we cannot unambiguously cite psychosomatic medicine as a domain where science countenances invisibles.

4. Returning from living forms (where the working assumption in biology and psychology is that the more *has to* derive from the less) to physics, my fourth point is that in making room for the immaterial/unseen, science also *honors* it. In two ways: first, by granting it causal priority; and second, by crediting it with greater power than its material derivatives possess.

Causal priority has already been mentioned. Whatever preceded the Big Bang is presumably immaterial, for everything that we recognize as matter has proceeded from it.

As for greater power, in nature power is inversely related to size. The well-founded law that the shorter the wavelength the larger the energy that is compressed into it, produces the conclusion that "in a thimbleful of vacuum there is more energy than would be released by all the atomic bomb fuel in the universe."<sup>11</sup> Expressed in terms of particles instead of waves,

the amount of energy associated with light corpuscles increases *as the size is reduced*. The energy necessary to create a proton is contained in a light pulse only about  $10^{-11}$  centimeters in diameter. And the energy of a million protons would be contained in a light pulse a million times smaller.<sup>12</sup>

5. My fifth and last point is that science has joined Neoplatonism in being, in the end, apophatic. If "to penetrate into the transintelligible is the deepest desire of our intellect,"<sup>13</sup> science has come to honor that dictum. I will let a single quotation, from John Wheeler, the father of superspace, make my point.

A drastic conclusion emerges out of quantum geometrodynamics: *there is no such thing as spacetime in the real world of quantum physics....*

On this picture physics is a staircase. Each tread registers a law. Each riser marks the transcendence of that law. The staircase climbs from: step to step: density, and density found alterable; valence law, and valence law melted away; conservation of net baryon and net lepton number, and these conservation laws transcended; conservation of energy and angular momentum, and these laws likewise overstepped; and then the top tread displaying all the key constants and basic dynamic laws—but above, a final riser leading upward into nothingness. It bears a message: With the collapse of the universe, the framework falls down for every law of physics. There is no dynamic principle that does not require space and time for its

formulation; but space and time collapse; and with their collapse every known dynamic principle collapses.<sup>14</sup>

## IV

My conclusion?

As I said at the outset, if we proceed from the whole (The Great Chain of Being) to the part of the whole that science deals with, science's findings seem not only compatible with that Chain, they seem actually to support it, to incline in its direction, in that from the Neoplatonic perspective they turn out to be the kinds of things we could expect science to discover.

The opposite does not hold, however. We can no more get from science to the Great Chain of Being than we can get from that Chain to the specifics of science, DNA and the like. For quality eludes science, and the Great Chain of Being is above all else a qualitative hierarchy. Playing upon the vertical dimension, which (as I noted) among spatial metaphors always and everywhere monitors degrees of worth, the Great Chain of Being proclaims that its higher levels are better and more real than the lower ones.

But the notion of degrees of reality, while easily grasped by children and the general public, has no place in science and therefore—I am asserting a causal connection here—is currently suspect in philosophy. That disparity, between children and the general public on the one hand (who accept as a matter of course that some things are more real than others) and on the other hand scientists and intellectuals who can't make head nor tail of the notion, says a lot about how out of touch with life philosophy has grown. So I want to insert two examples to drive that out-of-touchness home.

A former chairman of mine, after arguing well into the night against degrees of reality, toward the end of his diatribe grew suddenly thoughtful as he recalled that the previous evening his six year old son had introduced the notion in a context where (my chairman had to admit) it did seem to make sense. His son was watching a TV western. As the gunfire and fatalities mounted, he became alarmed and asked his father, "Dad, is this real?"

In some region of their psyches, adults too respond to the idea that reality is graded. Marketing agents know this well and turn it

to their advantage. On the day that I left for this conference, the cereal box on my breakfast table carried (as its inducement for costumers to select it over competing brands) two words that could have been scripted for our gathering: "Get Real!"

But to complete my conclusion: If the idea of a hierarchy of meaning, worth, significance, and in the end reality, has no place in science and has become suspect in philosophy, all the more need for a society dedicated to preserving the idea: The International Society for Neoplatonic Studies.

# **Scientific Realism and Plotinus' Metaphysic of Nature**

**Michael F. Wagner**

I have settled down to the task of writing these lectures and have drawn up my chair to my two tables. Two tables! Yes; there are duplicates of every object about me—two tables, two chairs, two pens...One of them has been familiar to me from earliest years. It is a commonplace object of that environment which I call the world...Table No. 2 is my scientific table. It is a more recent acquaintance and I do not feel so familiar with it. It does not belong to the world previously mentioned—that world which spontaneously appears around me when I open my eyes...I need not tell you that modern physics has by delicate test and remorseless logic assured me that my second scientific table is the only one which is really there—wherever “there” may be. On the other hand I need not tell you that modern physics will never succeed in exorcising that first table—strange compound of external nature, mental imagery and inherited prejudice—which lies visible to my eyes and tangible to my grasp.<sup>1</sup>

Thus did Sir Arthur Eddington introduce the world to his “two tables” and therein intimate some of the issues confronting realists in contemporary philosophy of science. Here, I shall not attempt to canvass the many variations in scientific realism. My presentation shall be selective and thematic. Nor do I claim that contemporary realists are incapable of resolving their issues. I shall, however, adopt a critical stance in developing some of them, partly to anticipate my subsequent explication of Plotinus' metaphysic of nature<sup>2</sup> and ways in which it incorporates a realist conception of science.

## I. Scientific Realism

Two issues implicit in Eddington's two-tables remarks are the relationship between his scientific table and his commonplace table (which "spontaneously appears...when I open my eyes") and the metaphysical character of his scientific table (which modern physics "has assured me...is the only one which is really there").<sup>3</sup> I shall return to this second issue later, in the guise of explicating the metaphysically enigmatic character of scientific entities. As for the first issue, contemporary scientific realists prefer to ignore it but occasionally attempt at least to finesse it. Reichenbach, in an early such attempt, exemplifies a common obfuscation among realists and foreshadows what has replaced that issue as one of contemporary realism's most problematic features. He remarks that "[k]nowledge begins with observation: our senses tell us what exists outside our bodies. But we are not satisfied with what we observe; we want to know more, to inquire into things that we do not observe directly."<sup>4</sup> Despite Reichenbach's glib appeal here to the existents "outside our bodies" which our senses "tell us" about, his example of the epistemic odyssey which science embarks upon is "when the physicist infers from the deflection of a magnetic needle that there is an invisible entity, called electricity, in the wire."<sup>5</sup> To be sure, insofar as the measuring apparatus (magnetic needle) and the conductor (wire) are situated in what we might characterize (to feign some semblance of metaphysical and epistemic banality) as the mundane world of routine sense experience, this example may comport with his previous remark. Indeed, Reichenbach seems to adopt a contrary stance to Eddington's when he proposes that scientific unobservables are just *façon de parler* for certain conceptual simplifications and presuppositions which allow science to suppose that mundane existents conform to its laws.<sup>6</sup> But, he quickly abandons this proposal. He locates routine observables in a macroscopic world which includes our body and sensory organs but, in regards to science, he proposes that, "[a]s in the world of our daily life, there are observables and unobservables in the world of the atom."<sup>7</sup> Reichenbach thus adopts a two-world stance which distinguishes observed and unobserved macroscopic entities from unobservable (sub)microscopic entities and the scientific observations to which he epistemically links them.

## 1.1 The Ontological Profligacy of Contemporary Realism

Scientific realists, I have noted, prefer to reduce Eddington's two-table problem to a one-table problem by sidestepping his commonplace entities altogether. Thus, echoing Eddington and Reichenbach, scientific realism has oftentimes been delineated just in terms of the unobservable entities of science, e.g. "[s]cientific realism is always some version of the following vague idea: scientific research often puts people in a position to claim that kinds of things exist that are unobservable."<sup>8</sup> Recent philosophy of science, however, has increasingly expanded scientific realism to encompass every existent denoted by any purported science, including so-called natural-kinds.<sup>9</sup> Implicit in this wholesale expansion of the sorts and number of scientific entities embraced by realism is the more liberal notion that, since all that matters to scientific realism are the denotations of science, this includes observable as much as unobservable scientific entities.

Scientific realism, accordingly, has also been characterized as the claim that "[s]cience aims to give us, in its theories, a literally true story of what the world is like; and acceptance of a scientific theory involves the belief that it is true."<sup>10</sup> To be sure, various realists would object to the reference here to truth. Harre, for example, argues for "a shift from truth realism to referential realism" with respect to scientific entities.<sup>11</sup> Others appeal to such alternative notions as best explanation<sup>12</sup> or something even weaker, e.g. the notion that science involves "the assessment of the real existence of postulated entities" just insofar as "scientific inferences to the existence of unobservables make agnosticism about these entities unreasonable."<sup>13</sup> But, these variations only underscore contemporary realists' readiness to embrace wholesale the many diverse existents denoted or postulated by science. As *realists*, in other words, scientific realists have no special interest in science's "story of what the world is like" apart from its ontological commitments.<sup>14</sup> In these terms, for example, "science advances by accumulating and sometimes deleting specimens from its collection"<sup>15</sup> or "inventories";<sup>16</sup> and it posits "the equal reality...of objects both large and small."<sup>17</sup> Two special influences help explain realism's tendency to embrace wholesale the putative ontological commitments of every science. The first is rooted in Logical Positivist explications of science and their subsequent

scrutiny. The second is the demise of scientific reductionism. I begin with the first.

Moritz Schlick, in a 1932 *Erkenntnis* essay, introduced the Logical Positivist conceit that scientific entities are linked to observables by virtue of the meanings of science's referring expressions or denotative statements. Schlick maintained that "[t]he meaning of a proposition consists, obviously, in this alone, that it expresses a definite state of affairs. And this state of affairs must be pointed out in order to give the meaning of the proposition...Accordingly, in order to find the meaning of a proposition, we must transform it by successive definitions until finally only such words occur in it as can no longer be defined, but whose meanings can only be directly pointed out. The criterion of truth or falsity of the proposition then lies in the fact that under definite conditions (given in the definition) certain data are present, or not present."<sup>18</sup> Schlick elaborates this early version of the *verification theory of meaning* in terms of his phenomenalist understanding of sense experience, so that "it is impossible to interpret an existential proposition except as a statement regarding a connection of perceptions";<sup>19</sup> and he underscores a key implication of this theory when he adds that "[i]t is perfectly true that every statement about a physical object or event *means* more than is verified, say, by the occurrence of a single experience. It is rather presupposed that the experience occurred *under very definite conditions*, whose realization of course can only be verified by something given."<sup>20</sup> This implies that statements purportedly denoting physical objects or events will differ in meaning just in case they (or their meanings) are verified by different data, where a phenomenal "given" constitutes a certain sort of data in virtue of the "very definite conditions" under which it shall be present.

Schlick also exemplifies the obfuscation noted in Reichenbach when he remarks: "But science! Does it, in opposition to common sense, mean something other than things like houses and trees when it speaks of the external world? It seems to me that nothing of the sort is the case...In fact we are at last convinced that the existence of even the most subtle 'invisible things,' assumed by the scientist, is, in principle, verified exactly as is the reality of a tree or a star."<sup>21</sup> Of course, Schlick's external world is already very different from what common sense supposes it to be. His is a world comprised of phenomenal "givens" and statements whose meanings are verified

by their presence as "data." His remark amounts to insisting that, since all meaningful statements are linked to phenomenal data, scientific statements in that sense denote the "same reality" as routine discourse. But, one may equally conclude from this (*a la* Reichenbach)<sup>22</sup> that the world of science must therefore be distinct from the world of common sense inasmuch as the "data" which verify scientific statements under very definite conditions—e.g. the deflection of Reichenbach's magnetic needle—are just *not* the same as those pertaining to the mundane existents of routine sense experience.

When Logical Positivists focused just on science, the usual approach was that intimated by Reichenbach's proposal that "[c]ognitive meaning is defined by a step process. First, a basic class *O* of *observational sentences* and terms is introduced which are assumed to have *direct meaning*...Second, the meaning of further terms and sentences is constructed by the help of *derivative relationships D*, which connect these new terms with the basis *O*. A step process of this kind is assumed in all forms of the verifiability theory of meaning."<sup>23</sup> This approach, including its distinction between observational and theoretic discourse, has been vigorously criticized.<sup>24</sup> Its phenomenalist associations, and its notions of theory and (or) meaning construction, have also come under scrutiny.<sup>25</sup> One strand of this scrutiny targets its roots in concerns over purportedly unobservable entities<sup>26</sup> and in particular seeks to weaken or dissolve the distinction between observables and unobservables as applicable to scientific entities.

Carnap himself, after distinguishing empirical from theoretical laws and characterizing the former as "laws that can be confirmed directly by empirical observation," remarked that "a warning must be issued." Philosophers and scientists have quite different ways of using the terms 'observable' and 'nonobservable'. To a philosopher, 'observable'...applies to such properties as 'blue', 'hard', 'hot'. These are properties directly perceived by the senses. To the physicist, the word...includes any quantitative magnitude that can be measured in a relatively simple, direct way...There is no question here of who is using the term 'observable' in a right and proper way. There is a continuum which starts with direct sensory observations and proceeds to enormously complex, indirect methods of observation."<sup>27</sup> Carnap's intimation here that this continuum does partly reflect scientists' lack of philosophical

acumen, however, is now dismissed. Harre thus argues more generally that "the rules for the use of any conceptual opposition, including that between 'observable' and 'unobservable' things and events, cannot be laid down in advance. Were the Mayor of New York smart enough to hire King Kong there might be a marked advance in the technology of garbage disposal. No doubt there would then be a shift in the rules for the use of the distinction between the portable and the non-portable. The same argument can be used in the case where a new technique of observation is developed perhaps with the help of more sophisticated instrumentation."<sup>28</sup> In effect, the primary meaning of 'unobservable' now connotes just the current lack of a designated observational technique or instrument. Indeed, Miller argues that already, "in a broad sense, the kinds of alleged entities, for example, molecules and electrons, to which any anti-realist wants to be uncommitted are observable. Physicists observe electrons passing through cloud chambers. Some crystals are single giant molecules, observable by the naked eye. Even electrons can be seen with the naked eye, when speeds near that of light give them substantial mass and energy."<sup>29</sup>

At the same time, though, such attempts to weaken or dissolve the distinction between observables and unobservables in science have not lessened the estrangement between the scientific world and what Cartwright also calls "the reality we have at hand."<sup>30</sup> Indeed, they have instead further entrenched scientific realism's ontological profligacy. This suggests that what they challenge is rather the pertinence of (un)observability concerns to scientific realism in the first place. More pertinent to the realist conception of science as "accumulating and sometimes deleting specimens from its collection" is the fact that scientific entities seem to be "new" additions to reality in a sense unrelated to scientific methodology, and so to whether or not they are observable. Bacteria, quasars, dinosaurs, and various other entities denoted by science may reasonably be thought of as not so much "scientific entities" as they are previously unknown mundane entities which science has made known to us. Whereas, the newness of such entities as Schlick's "subtle invisible things" is not due to their purported unobservability but because they seem in a sense to be inherently postulates of science itself. Science seems not merely to make these entities known to us but, as it were, to invent them even

while it investigates them; and these latter sorts entities, rather than the former, continue to serve as philosophy of science's model for scientific entities generally. Accordingly, far from mitigating the ontological profligacy implicit already in Logical Positivist explications of science, the upshot of their subsequent scrutiny is rather reflected, for example, in Quine's assertion that "[e]verything to which we concede existence is a posit from the standpoint of a description of the theory-building process, and simultaneously real from the standpoint of the theory that is being built,"<sup>31</sup> and in Harre's gloss of realism in terms just of "the use of sortal terms by a scientific community to pick out natural-kinds."<sup>32</sup>

Earlier this century, the preferred way for realists to mitigate any *prima facie* profligation of scientific entities was by appeal to *scientific reductionism*—the notion that all (other) sciences or parts of science are reducible to a single science and so, likewise, that all (other) scientific entities are reducible to the entities of this one science. This science was presumed to be elemental Physics inasmuch as its entities were presumed to be the most-elementary constituents of nature. In philosophy of science, this notion was explicated in terms of *theory reductionism* wherein the anticipated reduction "involves a hierarchy of theories, each of which is, ideally, derivable from a theory of simpler entities of the first [reducing] theory and structures of entities of the second [reduced] theory...[so that] in principle all our understanding of everything should be derivable from our understanding of the smallest components of the universe."<sup>33</sup> The ontological commitments of various sciences may thus be thought of as "a hierarchical classification of objects in which the objects at each level are complex structures of the objects comprising the next-lower level," even though methodologically the "[r]eduction consists in deriving the laws at each higher (reduced) level from the laws governing the objects at the next-lower (reducing) level."<sup>34</sup> But, scientific reductionism is now widely thought to be untenable. For example, Dupre argues that "the objects with which the macroscopic life sciences are concerned cannot generally be treated as structures solely of objects from the next-lower level. A sponge, perhaps, is a multicellular organism that is nothing but an assembly of cells. But an aardvark would more naturally be treated as an assembly of organs and other complex systems. Moreover, many of its essential constituents, such as hormones, are not cells, or parts of cells, but

molecules, whereas ions, also vital for its well-being, are more nearly atoms. So we find not only an intermediate level of organization, but also items from lower levels. Nor can these lower-level entities be treated merely as exogenous environmental variables. Their presence may often be determined by very complex events at the level of organs or organ systems...[And so] lower-level events may perfectly well be determined by what is happening at a higher level."<sup>35</sup>

A realist might respond to the demise of scientific reductionism by waxing poetic, e.g. by opining along with Cartwright that "[n]ature tends to a wild profusion, which our thinking does not wholly confine" and celebrating "the richness and variety of the concrete and particular",<sup>36</sup> or by pursuing a semantic double-aspect approach, as suggested in Ryle's claim that "[a] bit of the theory of ultimate particles has no place in it for a description or misdescription of chairs and tables, and a description of chairs and tables has no place in it for a description or misdescription of ultimate particles. A statement that is true *or* false of the one is *neither* true *nor* false of the other. It cannot therefore be a rival of the other."<sup>37</sup> But, such approaches pose additional problems. For example, their thinly veiled appeals to mundane entities challenge realism finally to confront the issue of scientific entities' relationship to those entities and to resolve it without resorting to poetics or semantic legerdemain. At the same time, realism must account for the fact that scientists (and most philosophers of science) still suppose that certain sciences are indeed more fundamental, or penetrate the reality of nature more deeply, than others.

## 1.2 Two Metaphysical Enigmas

Eddington, in this essay's prefatory passage, considers his commonplace table to be more stubborn than real. He maintains that his scientific table is his *real* table. He believes, in effect, that whenever he sits at his table, the table at which he is sitting is in reality his scientific table. Presumably, too, when he again sits at his table after pausing for lunch, the table at which he shall be sitting will once again be his very own scientific table. After all, since this is his real table, presumably it remains so even while he

is not sitting at it. The two metaphysical enigmas regarding scientific entities that I wish to highlight here concern, first, this notion that they *are* real entities (indeed, *the* real entities) which exist in the natural universe purportedly investigated by science and, second, their presumed individuality—e.g. such presumptions as that *this* one is a real entity and it is a distinct entity from *that* one, or that *this* is the *same* real entity as one which existed here earlier today. The metaphysically enigmatic character of scientific entities seems most patent in attempts to explicate the conceptual apparatus of extremely high-energy or deep quantum Physics. However, certain thematic trends in contemporary philosophy of science render all scientific entities metaphysically enigmatic in these respects.

It seems especially characteristic of the entities or phenomena postulated by deep quantum Physics that they manifest themselves only "in a particular environment, which, when deliberately created, we call the experimental conditions"; indeed, "[e]xperiments at this level, transform nature."<sup>38</sup> Harre is in part arguing towards his thesis that science's postulates "involve very special assumptions about manifest behavior in usually highly contrived conditions."<sup>39</sup> Science thus "transforms nature" insofar as its own conceptions of the entities it postulates may or may not comport with the "behaviors" or "natures" of real existents in their natural environment. But, Harre is presumably also alluding to the more particular fact that the postulates of deep Physics are unobservables in a very special sense. As Reichenbach notes: "But why can they not be observed? Why can we not use a supermicroscope and watch the particles on their path? The trouble is that in order to see a particle we have to illuminate it...A light ray falling on a particle pushes it out of its way; what we observe, therefore, is a collision and not a particle traveling peacefully on its path."<sup>40</sup> Moreover, it is unclear whether this collision allows us to observe the particle itself, even if contrivedly and distortedly: "Speaking of particles means attributing to them a definite place and a definite velocity for each time point...For small particles, however, the disturbance by the observer, as Heisenberg has shown, makes it impossible to measure both values simultaneously."<sup>41</sup> Here, though, the observational (measurability) uncertainty implied by Heisenberg's indeterminacy principle is less pertinent than the ontological uncertainty, as it were, which it may suggest (but does

not entail). In this regard, perhaps the more significant fact concerning entities whose mass and energy render them "smaller" than light is their duality with respect to how they manifest themselves to science, so that "the same physical reality admits of two possible interpretations, each of which is as true as the other, although the two cannot be combined into one picture... We can regard the elementary constituents of matter as particles or waves; both interpretations fit the observations equally well and equally badly."<sup>42</sup>

Scientists and philosophers of science strive to avoid supposing that the entities observed in slit experiments, for example, just *are* both particles and waves. Hawkins' explication of the conceptual apparatus of deep Physics, accordingly, has it that "quantum fluctuations of [the quantum matter-field] and the associated creation and destruction of particles are described as *potentialities* of the field";<sup>43</sup> and Harre proposes that the "entities" postulated by deep Physics be thought of as *affordances* inasmuch as they manifest themselves to science "in phenomena which are brought into being through some human intervention."<sup>44</sup> Potentialities and affordances, though, are what they are just by virtue of the ways in which they manifest themselves; by themselves, they are nothing at all, or they are not any sort of *real* existents. Moreover, a sort of real existent which manifests itself in conceptually incompatible ways hardly seems less enigmatic than one which just *is* two conceptually incompatible sorts of entity.

Harre suggests, rather, that an affordance may instead be thought of as "the disposition of an unspecified substrate to manifest a definite interaction with a highly specified interactant."<sup>45</sup> He calls this substrate *glub* and purports that "classical physics permits the realization in physical apparatus of two classes of concepts, particulate and distributed, particle concepts and wave concepts. The glub is such that the two classes of apparatus cannot be used together, and therefore a description of phenomena in which instances of concepts of each class are paired is unacceptable. Particles and waves are created out of the glub by the use of pieces of apparatus. We should not think of the glub as being either particulate or wave-like in the absence of such an interaction."<sup>46</sup> But, this only deepens the enigma inasmuch as the conceptually incompatible ways in which deep-entities manifest themselves are now explicitly thought of as experimental

contrivances or artifacts. Perhaps Harre's glub is not nothing at all; but, what it *is* cannot be explicated without reference to certain experimental conditions or scientific apparatus and their artifice. Inasmuch as Eddington presumably is not sitting inside a high-energy accelerator beam when he sits at his table, this renders his supposition that he is sitting at his scientific table entirely opaque. Indeed, it now is entirely unclear whether it makes sense even to suppose that there ever is a deep-scientific table (or its deep-constituents) in the absence of the requisite experimental conditions and apparatus.<sup>47</sup>

The second metaphysical enigma is implicit already in questioning the sense of supposing that there are such things in nature as Harrean glub-ular entities, or individuations of his ubiquitous glub-ular postulate. Regarding deep Physics itself, Hawkins remarks that "[i]n quantum-mechanical identity... there are natural kinds, species, whose members are indistinguishable from one another in *all* respects that are relevant to the *causal* description of their behavior"; indeed, "quantum mechanics assumes that two elementary particles are wholly indistinguishable," so that "[for] the building blocks of matter... there is no individuality."<sup>48</sup> Minimally, even if we allow that deep-entities must be individuals in *some* sense, we have no conceptual basis for distinguishing between the same individual manifesting itself in similar but distinct phenomena and those phenomena being manifestations instead of distinct individuals. At one extreme, Eddington's scientific table may be a distinct table every time he sits at it; at the other extreme, it may be the same table as Albert Einstein's and everyone else's.

Further clouding the matter is the notion already implicit in Early Modern science that scientific entities or phenomena cannot ultimately be explicated without reference to the natural world in its entirety. For example, "[w]ith the development of Newton's laws it became possible to say that the motions in any system of bodies are determined by, and predictable in terms of, the forces of interaction within the system and the external forces acting on it"; but, "[e]xternal forces, in turn, are internal to a more inclusive system. In the imagined limit to which any isolated system could be expanded—in the universe as a whole—all motions are determined by the material interactions of [all] bodies according to the laws of

motion."<sup>49</sup> But, here again, the metaphysical implications of this notion become more patent with deep Physics.

Harre, for example, introduces the notion of *ultragrounding* to propose that we "ground the basic dispositions, the tendencies, propensities and powers of the simplest beings that theory requires and experiment sustains, in the properties of the whole universe."<sup>50</sup> The gist of this proposal is more explicitly applied to quantum-reality in Miller's treatment of "the most important distinctive feature of quantum physics, the so-called superposition of quantum states, and the entanglements and interferences among probabilities to which superposition gives rise."<sup>51</sup> Miller explicates the pertinent conceptual and mathematical apparatus which allows one to calculate from the wave functions associated with observed quantum manifestations *eigenvalues* which (in realist terms) correspond to *eigenstates* of the observed subsystem or object-reality;<sup>52</sup> and he argues that "[i]n the realist quantum physics that I have described, real properties of systems, described using distinctively quantum-physical means, are all that influences events within the systems...[Thus,] properties of systems, typically superpositions irreducible to separable properties of systems, govern the course of events."<sup>53</sup> Inasmuch as the "system" to which quantum events, states, or properties would belong outside the experimental environment is just the natural universe, this implies that the postulates of deep Physics are in reality nothing other than the entire universe, or certain states or properties of it.<sup>54</sup>

Though most patent for the postulates of deep Physics, these enigmas are implicit as well in recent work focusing on what might be characterized as the ineradicably *contextual* nature of all scientific entities. Some of this work responds to an earlier naivete regarding scientific methodology or justification, and how scientific laws relate to real existents in nature. An example of this naivete is Reichenbach's contention that inductive inference is the pivotal notion upon which "the development of modern empiricism hinges" and that "all forms of inductive inference are reducible to induction by enumeration," so that modern empiricism encompasses science inasmuch as "repetition is all that distinguishes the causal [i.e. scientific] law from a mere coincidence."<sup>55</sup>

In response, Hintikka argues that *scientific* induction does not infer generalizations from individual instances but proceeds from what is already "a limited generalization...to a less restricted

generalization;"<sup>56</sup> and Cartwright rejects altogether the notion that scientific methodology or justification is an application of inductive logic, explicating it instead in terms of what she calls *the analytic method*, where "[t]he analytic method is closely associated with what we often call Galilean idealization. Together idealization and abstraction form a familiar two-tiered process that lies at the heart of modern scientific inquiry. First, we try to find out ...how the feature under study behaves, or would behave, in a particular, highly specific situation...[Second,] we abstract the nature [e.g.] of the charge interaction from how charges behave in these specially selected 'ideal' circumstances. The key here is the concept 'ideal.' On the one hand, we use this term to mark the fact that the circumstances in question are not real or, at least, that they seldom obtain naturally but require a great deal of contrivance even to approximate. On the other, the 'ideal' circumstances are the 'right' ones—right for inferring what the nature of the behavior is, in itself."<sup>57</sup> Similar to Harre's treatment of deep Physics, Cartwright's more general approach questions the pertinence of scientific methodology to real existents in their natural environment but it also challenges the supposition that the entities postulated by science are at least *real* entities and not mere contrivances, artifices, or conceptual inventions.<sup>58</sup> Or, as Suppe concludes from his own treatment of scientific methodology, "[p]hysical systems, then, are highly abstract and idealized replicas of phenomena" purported to exist in nature.<sup>59</sup>

A second sort of recent work focusing on the ineradicably contextual nature of scientific entities is partly related to the scrutiny of Logical Positivist explications of science noted earlier. It considers how (purportedly) empirical concepts in science arise in the first place. Harre, for example, proposes that a scientific natural-kind concept is semantically determined by a presumed "exemplary instance" which, in effect, is posited in response to the question "How is it possible that there are many beings which display contextually interesting similarities?"<sup>60</sup> And, Dupre argues further that "[o]nly the most extreme reductionist could suppose that examining a particular individual would allow one to determine to what kind it belonged apart from the prior recognition and at least partial characterization of that kind," where this *a priori* characterization of a natural-kind must then "be considered as applying to typical members of kinds rather than to all members."<sup>61</sup>

Kuhn develops the theme yet further in maintaining, first, that acquiring an empirical concept involves a "metaphor-like process" wherein one encounters "exemplary elements of the extension of the concept" but, second, that its scientific usage also requires synthesizing it into the conceptual form of rules and generalizations, wherein the requisite "explication which molds [an empirical concept] into such a form will, in a certain sense, change its nature."<sup>62</sup> Such considerations as these not only challenge the supposition that empirical scientific concepts denote real entities but implicitly question as well whether they even denote *individual* existents rather than conceptual exemplars, formalized artifacts, or the like.

To be sure, science itself, except perhaps in the special case of deep Physics, is widely presumed to be uninvolved with the sorts of metaphysical issues which philosophers raise concerning individuality. Common wisdom has it, for example, that "the science of mechanics...[is] applicable indifferently to all material things;"<sup>63</sup> and the Physics of relativity seems, if anything, to buttress classical Physics's presumed universe of individual existents inasmuch as "[t]he spatio-temporal order appears no longer as an empty vessel within which matter happens to be, but as the modality of the coexistence and interaction of things."<sup>64</sup> Accordingly, it seems appropriate and reasonable that philosophers of science should presume that individuality is insured for scientific entities just by the spatio-temporally indexical character of a science's referring-expressions, or of their use by scientists.<sup>65</sup> This suggests that scientific entities—like, perhaps, more mundane entities—are *individuals* by virtue of their spatio-temporal continuity, e.g. so that two spatio-temporally indexical uses of a scientific referring-expression shall denote the same individual just in case the denoted entity exists at every moment along a spatio-temporal continuum that includes these two referential moments.

A chief difficulty with this suggestion, at least for philosophy of science, is that it can insure only a *contingent* individuality and not the *modal* individuality required by scientific entities. Suppe, for example, maintains that the physical systems postulated and investigated by science "are highly abstract and idealized replicas" which at best characterize how a natural entity "would have behaved *had* the idealized conditions been met" in nature;<sup>66</sup> and Cartwright avers that "to understand [scientifically] what happens

in the world, we take things apart into their fundamental pieces...[We] carry the pieces from place to place, assembling them together in new ways and new contexts. But [we] always assume that they *will try to behave* in new arrangements *as they have tried to behave* in others."<sup>67</sup> Minimally, individuality in the scientific world requires that what exists (or "behaves") in one context may be the same individual as one which *might* also exist (or "try to behave") in a different context. But, that what exists at a certain spatio-temporal moment may *in fact* be, because of its spatio-temporal continuity, the same individual as one which exists at another spatio-temporal moment does not insure that it also *might* exist in yet other spatio-temporally indexical contexts, including contrived or idealized ones.<sup>68</sup>

Perhaps the requisite modal individuality may be explicated by reference to the modal character of scientific laws.<sup>69</sup> This latter notion has sometimes been explicated by supposing that scientific laws are implicitly subjunctive and(or) counterfactual in meaning or intent.<sup>70</sup> That is, supposing that a scientific law may be expressed in the form of a conditional statement 'if A obtains then B obtains,' we might then suppose that the sense of 'if...then...' here entails the subjunctive statement 'if A were to obtain then B would obtain' and(or) the counterfactual statement 'if A had obtained then B would have obtained'.<sup>71</sup>

One influential approach to understanding the meaning of modal discourse and its relation to individuality employs the notion of possible worlds. If such modal features of scientific laws as their subjunctive and(or) counterfactual intent are taken to be manifestations of some more general modal characteristic, e.g. natural necessity, we might suppose that "[a] statement may be said to be naturally or physically necessary if, and only if, it is deducible from a statement function which is satisfied in all [possible] worlds that differ from our world, if at all, only with respect to initial conditions."<sup>72</sup> We might then further suppose that scientific entities have the requisite modal individuality just insofar as they are capable of having necessary properties, or having properties necessarily. Plantinga, for example, posits that "an object *x* has a property *P* contingently only if there is a possible state of affairs *S* such that *x* would not have had *P* had *S* obtained. This...obviously implies that the same object exists in more than one possible world."<sup>73</sup> Conversely, then, an object would have a

certain property necessarily just in case there is no possible state of affairs (or "world") wherein it would not have that property. Notice, however, the implicit reliance here upon the modal notion that the object *would* or *would not* have a certain property. As an explication of modal individuality for real (or actual) entities in nature, moreover, it presumes as well that these entities are indeed the same individuals as the ones which it purports to exist in and across possible worlds, or to have or not have certain properties in and across possible worlds. A chief difficulty with this approach, accordingly, is its apparent question-begging reliance upon modal individuality, or its presumption of modally-individual real entities.

### 1.3 Two Epistemic Enigmas

Contemporary philosophy of science demands that science, and also philosophy of science itself, shall conform to the Modern empiricist tradition, or at least that it shall use any conceptual means and machinations it can devise in pursuit of this ideal. Here, I shall highlight two of the epistemically enigmatic features of contemporary philosophy of science generally, though they may seem all the more enigmatic in the more specific context of scientific realism. The first is that the less empirical a science is or becomes, or the farther removed its conceptions are or become from its supposed empirical ties to nature, the more true and perhaps even scientific it is or becomes. The second lies in the recognition by philosophers of science, despite their empiricist desideratum, that science is distinctively different in some epistemically significant respect from more routine empirical cognitive activities, including from the paradigmatically empirical activity of sense experience.

The first enigma can be seen, for example, in Popper's observation that scientific theories vary in their generality and his related contention, regarding the "worlds" they denote, that "[a]lthough in one sense of the word 'real,' all these various levels are equally real, there is another yet closely related sense in which we might say that the higher and more conjectural levels are the *more real* ones—in spite of the fact that they are more conjectural."<sup>74</sup> In a similar vein, Harre supports the *robustness principle* that "[w]hatever persists unchanged through change is

real" while also claiming that more general theoretic conceptions are less "reviseable," or more persistent, than less general ones, so that natural-kind concepts are semantically more robust than individuals and "categories" are more robust than kind-concepts.<sup>75</sup> Insofar as Popper's higher, more conjectural levels of scientific theory and Harre's more general concepts and categories cognize natural existents in increasingly more perspicuous or "true" ways, such *contrapost* seems also to intimate how distinctively different science is from other empirical cognitive activities. This difference has more traditionally, though, been characterized in terms of science's distinctive status as discerner of nature's laws.

To be sure, the Positivists' covering-law or deductive-nomological model of scientific explanation seemed to downplay science's cognitive distinctness and remoteness from other sorts of empirical cognition insofar as it just "makes explanation...a matter of subsumption under general laws...In the 'deductive-nomological pattern,' empirical general laws and statements of initial conditions are presented which logically entail the statement that the event in question has occurred."<sup>76</sup> At the same time, though, this appeal to scientific laws' purported empirical generality meant to embrace the traditional supposition that "there is a basic difference between laws of nature and laws of society, on the one hand, and between laws of nature and accidental generalization, on the other. Laws of society can be violated and can be changed, while laws of nature can neither be violated nor be changed. Laws of nature are supposed to reflect necessary connections between events of one kind and events of another (or between certain properties and other properties), which are absent in the case of merely accidental generalizations."<sup>77</sup> More recent philosophers of science are less coy about distancing the cognitive aims and character of science from routine empirical cognition, e.g. averring that scientific cognition requires "a two-stage move from raw phenomena to statements of the theory—first a move from phenomena to 'hard' data about the physical system in question, and then a second move from the physical system to the postulates, etc., of the theory. *The two sorts of moves are qualitatively quite different.*"<sup>78</sup>

Further isolating science from other cognitive activities, contemporary philosophers of science also portray particular sciences as cognitive wholes unto themselves—as each constituting a certain conceptual scheme whose cognitive employment is

ineradicably theory-dependent.<sup>79</sup> One response to this isolationism attempts to include science as just one among many cognitive activities comprising the archeology or sociology of human knowledge.<sup>80</sup> Typically, though, its distinctiveness is still recognized in some fashion. For example, Grinnell maintains that there remains a distinctive "scientific attitude" which differs "from other attitudes [by its] assumption of universal, intersubjective validity";<sup>81</sup> and Harre purports that, although epistemic agreement among scientists should be explicated as a socio-behavioral phenomenon, in science "the conditions of social co-ordination of action require a drive towards achieving the maximum of intersubjectivity among belief-systems."<sup>82</sup>

Another response involves a new generation of empiricist epistemologies which replace the Positivists' phenomenalist entities with a naturalistic explication of sense experience and insist that even routine sense experience is already a fully-fledged cognitive activity. This approach was inspired especially by Quine's proposal that "[e]pistemology, or something like it, simply falls into place as a chapter of psychology and hence of natural science. It studies a natural phenomenon, viz., a physical human subject. The human subject is accorded a certain experimentally controlled input—certain patterns of irradiation in assorted frequencies, for instance—and in the fullness of time the subject delivers as output a description of the three-dimensional world and its history...The old epistemology aspired to contain, in a sense, natural science; it would construct it somehow from sense data. Epistemology in its new setting, conversely, is contained in natural science, as a chapter of psychology."<sup>83</sup>

An influential example of the pages purportedly to be found in psychology's epistemology chapter is Gibson's conjecture that "physical objects and their properties are specified by information present in the 'ambient array'. The ambient array is a flux of energy shaped by the presence of both the perceiver and that which is perceived... 'Information' in the ambient array 'specifies' the object which structured the array. An organism in actively exploring the array for higher-order invariants, 'picks up' that information. It is as the 'pick up' that perception occurs."<sup>84</sup> The related insistence, implicit already in this portrayal of sense experience as a kind of information "pick up," on the cognitive character of routine sense experience is rendered explicit, for example, in Kuhn's view that

"[t]he products of perceptual acts are rather codetermined by 'conceptual categories,' 'conceptual parameters,' or 'perceptual categories,' in the sense that such parameters determine *as what* a given object of perception will be identified," though he qualifies this in maintaining that "these perceptual categories should not be assumed to be constant over all humans, for they depend to an important degree on the perceiver's learning history."<sup>85</sup> This qualification, however, is emblematic of the apparent circularity, or perhaps vacuity, which seems endemic to naturalistic epistemology. Hoyningen-Huene thus notes, regarding Kuhn's view, that individual and community learning histories cannot "imply any progress toward more closely capturing the *nature* of the purely object-sided (whatever that might mean); all it implies is that we more closely capture an object-sided *equivalence relation*,"<sup>86</sup> i.e. that we may continually refine *as-what* we happen to identify certain objects of sense experience. The implied challenge is whether naturalistic epistemology can explicate epistemic notions (e.g. knowledge) without reducing them just to individuals' concepts or beliefs (e.g. to what someone happens to have "learned" to believe, and so purport to constitute knowledge); or, whether it requires that, like Quine, we ignore the distinction between natural processes of knowing and (scientific) knowledge of natural processes.

One strategy for mitigating this feature of naturalistic epistemology in effect reasserts the legitimacy of employing scientific concepts to explicate empirical cognitive activity by arguing that science does an epistemically superior job at sense experience's own cognitive aim—in realist terms, of discerning real existents in nature. The strategy turns on some such claim as, since naturalistic explications of sense experience presuppose science, "[w]hat almost all such [naturalistic] conceptions share...[is] a strategy of *deferring to the actual causal structure of the world* in classificatory, inductive, and explanatory practice."<sup>87</sup> This still presumes, though, that science and(or) philosophy of science includes and(or) exhausts the epistemically important features of empirical cognition. The strategy also presumes that science does a superior job at discerning the *same* existents which routine sense experience discerns. Moreover, all but lost in the attempt to render science, as it were, like sense experience only better is the longer-standing supposition, still shared by scientists and by many

philosophers of science, that the cognitive aims of science are just *not* the same as sense experience's. They may include the cognitive task of discerning natural existents but science, perhaps most distinctively, also aims to discern nature's laws, for example.

## II. Plotinus' Metaphysic Of Nature

Eddington's distinction between the real world of science and the seeming world of routine cognition is emblematic of science's epistemic preeminence, especially since Early Modern times, as well as of its increasing isolation from the rest of human cognition. Indeed, we have seen that the contemporary presumption that science is fundamentally an empirical activity has, ironically, deepened this isolation while also rendering its epistemic preeminence all the more opaque.

Plotinus was well aware of the scientific conceptions of his day and sought to accommodate them in his philosophy. In this, the scientific realism implicit in his metaphysic of nature eschews Eddington's dualism between scientific and commonplace entities. A more appropriate contemporary distinction for locating science within Plotinus' conception of human cognition is Wilfrid Sellars' classic distinction for contemporary philosophy of mind between the *manifest image* of human beings and the *scientific image* of them.<sup>58</sup> Sellars' distinction is not meant to distinguish science's conception(s) of things (e.g. human beings) from purportedly non- or pre-scientific conceptions. Rather, his scientific-image connotes the increasingly de-person-alized physical and neurologic sciences which have emerged more-or-less during the past century; whereas, his manifest-image connotes all other, though especially all previous, conceptions and sciences.

Plotinus' metaphysic of nature incorporates a conception of science which seems overall to comport with Sellars' notion of manifest image(s). A dissimilarity may be that Plotinus' scheme does accommodate highly formalized and deep science.<sup>59</sup> Like a Sellarsian manifest image, however, Plotinus' scheme does not entirely distinguish the real objects of science from the real objects of routine cognition; and it does not identify the latter just with Eddington's "world which spontaneously appears around me when I open my eyes," nor with sense data or similar phenomenalist

entities. The latter do comprise the world of sense experience; but, for example, they are also objects for Plotinus' second principal cognitive modality, intellection. To be sure, Plotinus does sometimes contrast the "real" objects of intellection and the "unreal" objects of sense experience. His meaning, though, must be discerned alongside his companion doctrine that sense experience is in its own way an intellectual activity. He, accordingly, is not claiming that the objects of sense experience are not real existents but that cognizing real existents *as real*, or with respect to their reality, is the province of intellection; whereas, sense experience contrasts with intellection as such—with higher or more purely intellectual activities—in not cognizing existents this way.

Sellars' distinction provides contemporary counterpoint to Eddington's dualism.<sup>60</sup> My principal exegetical conceit, however, shall be that for Plotinus real entities in nature are *metaphysically polymorphic* inasmuch as they comprise distinguishable but not distinct realities or levels of nature's reality. A secondary exegetical conceit distinguishes those realities into certain dualities, or contrasting conceptions of nature's reality. This scheme accommodates science (or a science) as a cognitive activity which supplements a given conception of reality with a certain conception of natural causality or a principle of change. Plotinus distinguishes, for example, conceiving change to be an exchange of contrary qualities from conceiving it to be movement undergone by a natural entity due to another movement which is capable of producing such a change, and both of these from conceiving change to be a natural entity's coming-to-be a certain sort of entity (or moving thing) for which it has the potential to come-to-be.

A science's presumption of a certain conception of causality or of a principle of change marks it as fundamentally an intellectual activity, even if a relatively low-level kind compared to higher or purer kinds of Plotinian intellection. *Whether or not* a natural entity is capable of being an object of sense experience, accordingly, is irrelevant to its status as an object for science. The three examples of Plotinian science just noted may investigate unobservably small or dim existents (e.g. vanishingly small quantities or "atoms" of matter, or the Earth's atmosphere) and unobservably huge or bright existents (e.g. the natural universe itself, or Sol's internal "fire") as much as the medium-sized or visible-to-us objects of routine sense experience; and so nor would new observational techniques or

revised conceptions of observability be relevant to their status as objects for science.

My three examples of Plotinian science also illustrate the realist ranking of sciences implicit in Plotinus' scheme—as it were, his levels or deepness of natural reality alternative to contemporary scientific reductionism—inasmuch as the passive-*post*-productive movement conception of change is more real or metaphysically deeper than the contrary-qualities conception, and the actual-*post*-potential coming-to-be conception is yet more real than both of these. I shall not attempt to survey the various sciences or sorts of science accommodated by Plotinus' metaphysic of nature. Rather, I now turn to my exegetical conceits of natural entities' metaphysical polymorphism and certain pertinent conceptual dualities, some of which may be schematized as follows:

SCHEMATIC of some conceptual dualities pertaining to natural reality:<sup>91</sup>

1. Substantiality (*ousias*)

A. qualified & relational	VS	B. self-substantial
Ai. qualitative VS quantitative		Bi. corporeally constituted VS formally composited

2. "Becomingness" (*genesens*)

I. static	VS	dynamic
ii. potential	VS	actual
iii. passive	VS	productive

3. Modality (*katagorema*)

A. accidental	VS	B. essential
A'. sense-experiential	VS	B'. intelligible

Here, I shall address mainly certain features of the first two groupings, which underscore the importance to Plotinus' scheme of ways in which we may conceive nature to be comprised of real entities and of natural coming-to-be.

II.1 Plotinus' Dual-Focus Conception of Natural Reality

Aristotle introduced the notion of substance (*ousia*) to denote the proper subject(s) for assertions of real existence or ascriptive assertions which presuppose real existence. Plotinus also uses this notion when explicating the real objects of cognition. However, Plotinus' use of it, especially in the case of natural entities, differs from Aristotle's in crucial respects. One of these differences may be seen to follow from the special importance which Plotinus accords to coming-to-be. Plotinus considers the classical Greek identification of the natural universe as the world of coming-to-be to be far more germane to explicating its reality than its status as the world of sense experience. But, an Aristotelian might understand this to mean that coming-to-be presupposes or must be ascribed to the entities denoted by Aristotle's notion of substance, indeed by his "primary sense" of this notion; whereas, Plotinus seems to understand this to mean that natural reality ultimately just *is* coming-to-be, so that the proper subjects of cognitions or ascriptions concerning natural existents must ultimately be explicable in terms of some metaphysically adequate notion of coming-to-be.

In Plotinus' scheme, such cognitive activities as sense experience and science, as it were, focus on substance(s) when postulating or cognizing real existents in nature; but, the notion of substance ultimately plays only an intermediate role in the explication of natural reality. Moreover, natural substance may itself be conceived in several ways. In a second crucial departure from Aristotle's notion of substance, Plotinus' analysis of natural substance implies that we may properly conceive real entities in nature to be substances in several ways. More precisely, he distinguishes four senses of *substance* for natural entities:<sup>92</sup>

(S1) *The form-matter composite substance.* This way to conceive natural substance may be considered primary with respect to the other three because it most clearly does satisfy the Aristotelian definition of "primary" substance as "that which neither exists in a substrate nor is designated by reference to a substrate as something distinct from it"<sup>93</sup> and because the deeper Plotinian notion of forming-principle (*logos*) is related most closely to this conception, inasmuch as a forming-principle effects a real entity "in conformity to the form" of its composition.<sup>94</sup>

(S2) *The corporeally constituted substance.* This conceives a natural substance to be comprised of certain functional components and their corporeal constituency. It also satisfies the Aristotelian definition;<sup>95</sup> but, it assumes that a substance is delineated by its corporeal components and constituency rather than by its form of composition. Corporeally constituted substances may be distinguished into (i) *more matter-like substances* which are delineated just by their constituency—e.g. the four “simple” bodies: air, earth, fire, and water—and (ii) *more instrument-like substances* which are delineated by their “particular configurations of parts,” i.e. functional components, along with their corporeal constituency.<sup>96</sup>

(S3) *The Accidental substance*<sup>97</sup> conceives a natural substance to be “a certain agglomeration of qualities and matter.”<sup>98</sup> Here, that natural existents are the real objects of sense experience is properly salient,<sup>99</sup> though Plotinus’ notion of qualities does not presuppose sense experience. Qualities are ways or respects in which one entity may be demarcated in relation to others,<sup>100</sup> though this surely includes so-called sensible qualities. This way of conceiving natural substance no longer satisfies the Aristotelian definition since qualitative existence is included among those things which “come about from and because of” substances in the (S1) sense,<sup>101</sup> and so it fails to satisfy the second half of that definition.

(S4) *The Derivable substance*<sup>102</sup> results from conceiving one or more of the qualities in an (S3) agglomerate to be qualifying an (S1) substance itself, thereby rendering it a *qualified thing*. Consequently, (S4) substances are derivative from (S3) substances. Though this way of conceiving natural substance seems to satisfy the Aristotelian definition, it is thus farther removed than (S3) from (S1)’s primacy.<sup>103</sup>

But, why is (S2) substance derivative or less real compared to (S1) substance merely because it delineates a natural substance in terms of its corporeal components and constituency instead of its form of composition? To answer this, we must recognize that the matter referred to in the (S1) notion of substance, viz. its substrate, does not contribute to a composite’s real existence since it is as such nothing; or, rather, it is not anything other than or apart from the natural substance itself. Something is a *substrate* insofar as something is related to it in such a way that we may ascribe this to it. The notion of substrate, accordingly, denotes a function and not

a reality, or real existent, and what fulfills that function for the composite is just the natural substance itself.

The term ‘matter’ may also be used to denote something real which may be properly associated with natural composites. In particular, it may also be used to denote, instead of a composite’s substrate, another substance—call it a *constitutive substance*—from or out of which the substance has been composited. This “real matter” becomes the corporeal constituency of the composite’s functional components. But, the substrate referred to in the (S1) notion itself is that to which we may ascribe things, e.g. as belonging to or received by or informing an (S1) substance; and, that to which we may ascribe things, including a certain form of composition, is not the composite’s functional components nor their corporeal constituency but the thusly composited substance itself. A composite substance, in other words, is not somehow “composed” of two real components, one denoted as *form* and the other as *matter*, but a single real entity which both is composited in a certain way (“has form”) and is also that to which we may ascribe its being composited in that way (“is matter”). Since every natural composite has corporeally constituted functional components (or at least distinguishable parts) it may also be conceived as an (S2) substance. But, the composite is not derivative from this (S2) substance; rather, that a given natural substance has certain functional components (or at least distinguishable parts) which in fact have a certain corporeal constituency is a consequence of the way in which it has been naturally composited (i.e. its form).

This also implies that a natural entity’s compositional form already satisfies the Aristotelian definition of ‘primary substance.’ Unlike qualities (which “belong to” it) or qualifications (which are “of” it) or corporeal components and constituency (which it “has”), its form is what in its entirety a natural entity just *is*, or rather ‘*is a*’—e.g. it is a tree or it is a human being. For example, “[i]f I predicate *human being* of Socrates, I am not asserting something akin to stating ‘the wood is white’ but akin to stating ‘the white thing is white’ since stating ‘Socrates is a human being’ asserts regarding some particular human being that he *is a human being*, which is to say that it asserts *human being* in reference to Socrates’ humanity, and this amounts to the same thing as asserting *Socrates* in reference to Socrates.”<sup>104</sup> The real existence of a composite substance is thus entirely delineated by its form, just as its real

persistence in coming-to-be is explicated by its continued conformity to its form—i.e. by its remaining just the natural substance which it is, or 'is a'.<sup>105</sup> Accordingly, Plotinus argues further that "Socrates does not impart the reality of a human being to what is not a human being but, rather, humanity imparts this reality to Socrates; for, since a particular human being thereby partakes in humanity, what else could Socrates be if not just the particular thing of the human being sort which he is? and, how could this *particular-of-the-human-being-sort* which he is effect any more real a substance than the existent human being does already?"<sup>106</sup>

The intermediate role of substance in Plotinus' metaphysic of nature emerges when we ask why a given natural substance is composited the way it is, or "has" the compositional form it has. For this, the pivotal notion is *forming-principle*. Plotinus maintains, for example, that in the domain of coming-to-be "a real substance itself proceeds by coming-to-be from a real existing source";<sup>107</sup> for, "nothing is real which is not a unity"<sup>108</sup> and "whatever is not a unity in some respect must be sustained by a unity and be just what it is because of that unity since, had it not become a unity despite its many constituents, it would not now exist just as itself—as what we designate to be a *particular* thing."<sup>109</sup> Plotinus identifies this real originative and sustaining cause of a natural entity's unity as its *forming-principle*, and so argues

It has been asserted regarding the qualified thing that, by intermixing and blending different qualities and in consort with matter and quantity, it effects substance for the objects of sense experience; and it has also been asserted that what common speech designates as a 'substance' is just this agglomerate of many things, so that a substance is no longer the particular thing itself but a qualified thing. Even then, however, the real existing forming-principle (e.g. of fire) would still indicate more the particular thing, while the shape it effects indicates more something qualified. Likewise, the *real forming-principle of a human being* is the *particular existent human being*, whereas the qualitative superfluance associated with corporeal nature is in reality an image of the forming-principle and exists rather as some qualified thing. Just as if, for example, the visible Socrates were the real human being and yet an image contrived in his likeness, and whose reality amounts to so much color and paint, was designated to be Socrates—so too, since there exists a *real forming-principle to which the real Socrates conforms*, the Socrates experienced sensorially is strictly

*speaking not Socrates* but so much color and configurations of parts which in reality are imitations of real existents encompassed by his forming-principle."<sup>110</sup>

The intermediate role of substance becomes even more patent when Plotinus turns to explicating natural coming-to-be, including the coming-to-be of substances. Plotinus typically appeals to (S1) substances when focusing his examples and explication of coming-to-be on natural entities.<sup>111</sup> But, as just seen concerning a natural entity's substance and individuality, Plotinus' explication of natural coming-to-be will ultimately focus instead on his forming-principles.

Of the three dualities included under 'becomingness' in my schematic, the distinction between passive and productive coming-to-be may seem especially pertinent to explicating coming-to-be inasmuch as these two notions seem not only to distinguish contrasting conceptions of coming-to-be but to delineate two classes of coming-to-be, or movement (*kinesis*). Indeed, Plotinus at first supposes just this, that every coming-to-be in nature may be classified either as passive or as productive. He suggests several ways in which the distinction might be formulated; but the formulation which instigates his critique of this supposition states that "movements which proceed from the moving things themselves are productive," whereas "movements which proceed from others [into the moved thing] are passive."<sup>112</sup> Plotinus examines this formulation by considering, first, whether passivity might not then characterize movements which could also be characterized as productive when considered from another (opposite) viewpoint and, second, the relevance of a movement's source to whether it is productive or passive.

Plotinus introduces the first consideration by observing that if movements which proceed from others are thereby passive, then the same movements could also be denoted as "movements which proceed into others"—e.g. "cutting as both as proceeding from what is cutting and proceeding into what is being cut is one movement"—so that they would also be productive.<sup>113</sup> He suggests two ways to avoid having the same movement be both passive and productive. The first considers such movements to be in fact comprised of successive pairs of movement, e.g. so that "cutting occurs when, from a certain sort of actuality and movement ascribed to the cutter, another succeeding movement comes to be in

what is cut."<sup>114</sup> The second considers the cutting movement to be as such a single (productive) movement proceeding from the cutter into what is cut, and then utilizes the notion that one existent may be distinct from yet a consequence of another existent to maintain that "the difference may not pertain to being cut as such but to a distinct movement which comes to be [in the recipient or 'patient'] consequent upon being cut: for example, being in pain, which is a clear case of something that is undergone passively."<sup>115</sup> Plotinus prefers this second way because it conforms to clear cases of passivity, as when a sentient being suffers pain as a consequence of being cut. He concludes that, when no such distinct movement is undergone by the patient, there is no passivity but just the fact that when movement proceeds from one thing into another "productive movement has a double existence: first, without regard for its existing in another thing, when this is intended by it, and, second, as existing also in that other thing."<sup>116</sup> He also concludes from this that 'passivity' denotes "what comes to be consequent upon a productive movement, where this does not mean its opposite (as being hurt is the opposite of burning) but denotes something that comes to be consequent upon the one real movement of being burnt and burning—viz. pain or something else, e.g. shriveling-up."<sup>117</sup>

Plotinus' second consideration, the relevance of a movement's source to its productivity or passivity, is more subtle. He considers whether a source of movement might not also passively undergo something consequent upon its own movement<sup>118</sup> and whether, even when one thing is moved by another, it might not also be involved somehow in bringing about what it passively undergoes.<sup>119</sup> He also considers whether the source of productive movement must always be the moving thing itself.<sup>120</sup> As a result of these considerations, Plotinus proposes that "passivity does not exist based on whether movement is from another or from oneself—e.g. something may rot on its own; rather, it exists when something, without part of itself being involved in the production, endures an alteration which is not involved in bringing about its substance."<sup>121</sup> Subsequently, he considers and dismisses a potential counterexample to this caveat concerning the bringing about of something's substance; but, he seems to think that this caveat does unnecessarily muddy the key point. He also recognizes that, strictly speaking, 'alteration' denotes movement in the domain of qualitative existence, typically with respect to contrary qualities. Accordingly, Plotinus concludes

his discussion of passivity and productivity by proposing that "passivity comes-to-be when something has within itself a movement whereby it is altered in any way; whereas productivity exists either when something has within itself a self-contained movement arising from itself, or else when a movement arising from itself proceeds to its end within another."<sup>122</sup>

Plotinus restates this conclusion without mentioning the restrictive term 'alteration' at all, proposing that "passivity resides in something's being disposed [ordered, inclined] *differently than before*. The substance of what passively undergoes as such acquires nothing whatsoever pertinent to a substance; rather, when a substance comes-to-be, what passively undergoes something is another reality," viz. its corporeal components or constituency.<sup>123</sup> Since every movement involving a corporeal entity leaves it "disposed differently" in some way, Plotinus' conclusion implies that passivity characterizes not only all alterative (i.e. qualitative) movements but also all movements ascribed to corporeal existents. He thus concludes elsewhere that *corporeal things are as such always and only passive* with respect to movement.<sup>124</sup> Rather than delineating two classes of coming-to-be, passivity and productivity are instead associated by Plotinus with corporeal movement and soul-like movement, respectively.<sup>125</sup> A movement is passive or productive, in other words, depending on whether it is conceived to be corporeal and(or) qualitative or to be soul-like, where for natural reality this latter connotes compositional forms or forming-principles.

Perhaps, then, natural comings-to-be or movements may as such be characterized in a singular fashion. Indeed, Plotinus echoes Aristotle's definition in suggesting that perhaps movement may be characterized as "the passage of something from potentiality to that which it is said potentially to be."<sup>126</sup> When characterized in this fashion, movement may be distinguished into those wherein something potential comes-to-be a real thing of a certain sort and those wherein something potential comes-to-be a real thing with respect just to the movement itself: "For, something may be potentially a real thing in that it can attain a certain form (e.g. it may be potentially a statue) and another in that it can attain an activity (e.g. it is able to walk), and when the former proceeds to become a statue, this procession is its movement; whereas, when the latter proceeds to walk, the walking is the movement," e.g. so

that the thing becomes something-walking.<sup>127</sup> In both cases, however, identifying a movement as a passage (or procession) implies that the movement itself must be entirely an actuality or actual existent, viz. an actual passage of a certain sort, and not at all a potentiality or potential existent—so that it in fact is just like a certain “restlessly awake form.”<sup>128</sup> The potentiality mentioned in this Aristotelian-seeming characterization of movement—and so, too, the notion of potential coming-to-be in my schematic—must instead refer to some existent’s having a potential for a certain actual movement, or its being a potentially real thing with respect to that movement. But, this also must conform to Plotinus’ Neoplatonic stricture that only actually real existents can be real causes. In cases where the movement or coming-to-be is such that something “attains a form,” for example, Plotinus maintains that “one must speak of some potentially real thing as *already another thing*—that is, as some thing and able to be another thing subsequently to being itself, either in such a way that it nonetheless survives the production of that other thing or else meaning that by admitting its own destruction it sacrifices itself for the sake of that other thing. The former is the sense of saying ‘bronze is potentially a statue,’ whereas water is potentially bronze and air is potentially fire in the latter sense.”<sup>129</sup> In previous terms, the statue is an example of composite substance and the bronze an example of constitutive substance; whereas, the latter examples involve pairs of constitutive substances.

Does this imply that we can properly ascribe a certain potential existence to something, as it were, only after the fact? We might reasonably suppose so when one constitutive substance comes-to-be from (i.e. replaces) another constitutive substance, and perhaps also when the composite is indeed a human contrivance (e.g. the statue). When the composite is entirely natural, however, Plotinus’ insistence that the potentially real thing must itself already be a certain actually real thing may be germane. Plotinus thus proposes, alternatively, that “potential existence, in our sense, designates some such thing as a certain substrate for passive undergoings and for shapes and forms which it is meant to receive in that it is disposed by nature to be receptive of them.”<sup>130</sup> This implies that the notion of a potentially real thing, or a potential existent, most properly denotes a corporeal or qualitative existent whose reality, we have seen, would derive from a compositional form or

(ultimately) a forming-principle. A corporeal or qualitative existent may thus be “disposed” in certain ways by virtue of its entirely actual compositional form or forming-principle.<sup>131</sup> Contrary to supposing that potential existence can only be ascribed *ex post facto*, accordingly, Plotinus claims that “it then is not that the potential thing comes-to-be an actual thing but rather that the subsequent actual thing comes-to-be from the already existent potential thing.”<sup>132</sup>

A useful analogy for synthesizing Plotinus’ ascription first of passivity and now of potential existence to corporeal and(or) qualitative existents as they relate to coming-to-be is that of a tool or instrument, viz. for the soul-like productive movements of actually real compositional forms or forming-principles. Plotinus maintains, for example, that the actual reality of movement, far from being an abstraction from our observations of movements or moving things, is rather itself the real cause of the observable phenomena or corporeal movements with which we commonly identify it:

We must not suppose that things which are in movement are the existent movements. For, walking is not the feet but an actuality proceeding from a certain *potency* to encompass the feet. Since the potency cannot be seen in the authentic condition in which it exists [as a potency], however, it is necessary to look at the activity of the feet—that is, not simply the feet as when they were at rest but as they are now encompassed by another [prior or higher] existent. This existent cannot as such be seen but by its relating to something else [viz. the feet] it can be seen accidentally (*kata symbebekos*) when one looks at the feet as first one assumes a certain position and then the other one does and they are not still. But the alternating bipedal movement one thus sees is a consequence of the alternating feet whereas the walking-movement itself is not something qualitative regarding the feet.<sup>133</sup>

A natural entity’s corporeally constituted functional components and(or) certain associated qualitative phenomena are in reality instrumentalities by means of which certain prior or more real actualities may manifest themselves, e.g. to our sense experience—analogous to the capabilities of tools to be utilized in certain ways in order to accomplish various tasks. As Plotinus thus proclaims elsewhere, “movement comes into sensible [corporeal] things from another [reality] which stirs and prods and innervates

and pushes those which partake in it so that they do not pause nor exist successively in the exact same condition."<sup>134</sup> Or, it "proceeds" into them "as a breath of air proceeds into another. And so, the movement potency pertaining to the capacity to walk pushes, as it were, and productively moves the walker's feet continually to assume one position after another; and when it pertains to the capacity to heat it heats something; and when the [movent] potency brings matter together into a natural assemblage it pertains to the generative capacity for natural growth...."<sup>135</sup>

The prior actualities of movement, or productive potencies, which are the real causes of corporeal and(or) qualitative movement may initially be ascribed to natural entities' compositional forms inasmuch as "no form of any kind can admit disorder or be at all passive but must be itself undisturbed while the matter has become passively related to it so that when there is coming-to-be the form, because of its presence in the composition, sets the matter in movement.... And so, this is the manner in which actual form exists in nature: such that it produces coming-to-be because of its presence in a composite substance—just as if the harmony existing in a lyre, by proceeding from itself, plucked the lyre's strings."<sup>136</sup> But, a compositional form, as the lyre analogy suggests, does not continually set its matter in movement, at least not with respect to every potency which might be ascribed to it. Here, too, the ultimate real cause is instead the forming-principle: "We term that *form* which is capable of producing a substance and *forming-principle* that which in the domain of [natural] substance productively moves it in conformity with its form."<sup>137</sup>

Inasmuch as corporeal and qualitative existence are less real ways to conceive the same natural reality, Plotinus even proposes:

When the form proceeds to matter it brings everything along with it, since the form encompasses everything—even magnitude, and everything else *in accordance with the forming-principle and what proceeds from it*. Magnitude is thus delineated for each sort of natural thing because of its form; for, the magnitude [or dimensions] of a human being differs from a bird's, and it also differs among various sorts of birds... Likewise, a particular thing, insofar as whiteness may be present in it, comes-to-be white because that [forming-principle] within this living being produces a white-colored thing, just as various other colors may be present in a variegated thing not because there

exists some sort of variegated color but, if you please, because it has a variegated forming-principle.<sup>138</sup>

Accordingly, "although corporeal things (e.g. animal bodies and vegetal bodies) exist, each one of them, as a plurality because of their colors and configurations and magnitudes and their various bodily parts and in whatever else may differ among them, this entire plurality derives from some one thing...[so that] corporeal substance exists because of the potency of forming-principles."<sup>139</sup> At the same time, though, we must not suppose that forming-principles, or their inherently actual productive potencies, somehow resemble their effects in the corporeal and qualitative domains of natural existence. Plotinus cautions:

The things we denote as being particular existent substances of a given sort are entirely forming-principles, which produce the qualities we then associate with those particulars; and so, if we subsequently investigate what in this respect a certain particular substance is, based on those [qualities] which forming-principles have produced, as if this were now itself entirely the substance, what we would now be considering is the qualified thing and no longer the particular substance itself. Indeed, this is how we always become misled—when, while investigating the particular substance, we back away from it and conform our investigation to the qualified thing instead. For, the real existent fire, for instance, is not what we are asserting it to be when we delineate it in terms which pertain to the qualified thing. The fire itself is a real existent substance; whereas, what we are seeing right now—as we gaze intently at what we are now considering the fire to be—this diverts our investigation from the particular substance, so that what would end up getting defined in this way is the qualified thing [and not the fire substance itself].<sup>140</sup>

Notice, too, that the distinction between compositional form and forming-principle all but dissolves here. Plotinus' choice of fire, the most active of the classical elements,<sup>141</sup> to illustrate his current point is emblematic of his view that ultimately natural reality is dynamic and not static.<sup>142</sup> Despite his use of the static Aristotelian notion that composite substances "have" form, Plotinus seems ultimately to conceive a compositional form to be certain interrelated soul-like processes or movements which sustain a natural entity's compositional integrity. But, it would seem, this conception could equally characterize an entity's forming-

principle; and so the distinction all but dissolves again when Plotinus argues further:

What, in the case of fire, then, is that substance which precedes the qualified substance? Is it the body? The genus—body—will then be the substance of fire, and then fire as such will be just the hot body and not even the entire qualified body will be the substance of fire. Or else, the heat will be in the fire in the way that snub-nosedness is in you. But, if we then took away the heat, and also the brightness and the lightness—as these also seem to be qualitative existents—the body's three-dimensional extension is all that remains, and then this matter will by itself be the elemental substance. But this does not seem correct; for, the form of a thing more properly designates its substance. But, the form of fire seems to be something qualitative. Not at all; the form of fire is not a fiery quality but a forming-principle.<sup>143</sup>

This metaphysical dynamicism extends “down” to corporeal and qualitative existence as well. For example, Plotinus adumbrates his doctrine that a potentially real thing must itself already be a certain actually real thing by averring that, “for a potentially existent thing, its own actuality is *its ability to move as this proceeds from it itself*”;<sup>144</sup> and, he insists, the fact that even the most body-like of corporeal existents are also soul-like (or living) is most evident in certain patently dynamic corporeal and qualitative phenomena: “But how is the Earth living? ... The expansion and shaping of rocks and the visible formation of mountains and their growing upwards from within themselves: all such things as these indicate the presence within the Earth of a productively craft-like ensouling forming-principle of some sort.”<sup>145</sup>

The main point to Plotinus' previous remarks concerning fire, however, was that we especially should not suppose that the inherently actual constituent potencies of forms and forming-principles somehow resemble corporeal or qualitative existents.<sup>146</sup> He thus elaborates that, “among the forming-principles, every term we use to designate a quality should be taken to denote an actuality, in concordance with our doctrine that the qualities which may be distinguished for each existent thing are *those ways in which substances may be demarcated in relation to one another*.”<sup>147</sup> Indeed, Plotinus avers that, “while a quality is entirely a characteristic of some particular thing, it is not a characteristic of it because of its being a substance of a certain sort”;<sup>148</sup> for, though a natural entity's qualitative existence is “brought about” by its

form or forming-principle, it thereby “derives from it *as it relates to some state-of-affairs external to it*.”<sup>149</sup> Insofar as we nonetheless find it useful to use terms denoting qualities when referring to their real causes, we must not forget that “the same quality-term is being used to designate both...something existing in a particular substance—what is just a certain actuality of it—and also something consequent upon this prior [reality] but pertaining to the one substance *as it relates to some other substance*,” or some external state-of-affairs.<sup>150</sup>

This characterization of qualitative existence as it relates to natural reality's higher or deeper levels implies as well that it, conversely, is not somehow reducible to them. Plotinian sciences which investigate coming-to-be in terms of concepts and principles pertaining to qualitative existence (or, likewise, to corporeal existence) are not reducible to sciences which employ concepts and principles pertaining to higher levels of natural reality. In the domain of Accidental or of Derivable substance, such notions as the classical conception of alteration as an exchange of contrary qualities may be appropriate for investigating coming-to-be; so, too, may be supposing, for example, that “when qualities intermingle with respect to matter many of them will interact productively with one another, especially those which exist in contrareity to one another,...[and so] that which passively moves is altered with respect to contraries by what is contrary to it,”<sup>151</sup> or supposing that an (S3) or an (S4) substance has the facility to “render what is apt to passively undergo qualitatively like itself ... to prod others into likeness with itself.”<sup>152</sup> Likewise, though corporeal (and also qualitative) existents are metaphysically passive, it may be appropriate when investigating this level of natural reality to employ not only such notions as local-movement but also such notions as impact, force, and the like. We may even, for example, explicate a corporeal substance's perishing by supposing that corporeal things, insofar as they are deficient in life, “destroy one another because of their irregular and unrestrained movements” and their resulting impacts on one other.<sup>153</sup>

Plotinus' scheme also seems to accord special status to quantitative concepts pertaining to corporeal and(or) qualitative existence. He notes, for example, that in the qualitative domain quantifiable extension seems to function as a kind of substrate in relation to all other qualities;<sup>154</sup> and he avers that extension and

other such quantifiable qualities seem in a way distinctive of natural existents inasmuch as, it seems, "whatever matter receives, it accepts *in an extended form*."<sup>155</sup> To be sure, "that which is receptive of every form cannot itself even be mass. But, concurrently with receiving any other quality, it is as though it becomes a certain mass."<sup>156</sup> Plotinus likewise conjectures that in effecting corporeal existence the soul-like forming-principles "generate a magnitude in accordance with the intelligible form...so that what has come-to-be will be proportionately equal by virtue of its magnitude to the potency of its unextended archetype"<sup>157</sup> and that they therein effect a corporeal universe "so filled with magnitude...that it is not deficient anywhere with respect to magnitude and is not scattered randomly about, but has interrelated parts and is not incomplete in any parts."<sup>158</sup> He does not develop detailed proposals regarding the sort(s) of science which might employ or presume such a geometric conception of natural existence; but he does proffer the dynamic conception of a natural universe which "actively moves its parts in relation to itself, forever reconfiguring its greater parts, as the relationships of its parts to one another and to the whole and their differing consequent dispositions towards one another bring about all the rest [of coming-to-be]...Each part thus moves in conformity to numbers—like the choreographic parts of a living being—so that the activities of the existing universe must be completely rational in two ways: both regarding the [geometrically] configured things which come-to-be within it and regarding configurations among these parts [of the universe]—and also regarding whatever these bring about and the manners in which they do so."<sup>159</sup>

## II.2 Two Metaphysical Conjectures

The foregoing elaboration of the Plotinian conjecture that natural entities are metaphysically polymorphic postulates a dual focus, or a dual conception of the ultimate real subjects, for our cognitive activities. Insofar as cognition postulates or presupposes real existence, its proper subjects may be explicated in terms of the classical notion of *substance*. But, natural substance may be conceived in four ways. The denotations of ascriptive predicates or terms, which Aristotle characterized as *things pertaining to*

*substance*, may be conceived to constitute substances insofar as they are thought to include their own substrate or (as, for example, in Stoicism) to be real qualifications of existent substances. Natural substance may also be conceived to be just certain functional components and corporeal constituencies. But, these ways are secondary or derivative in relation to conceiving natural substances to be form-matter composites, i.e. to be forms of natural composition. Thus, all cognitive activities regarding natural existents, insofar as they postulate or presuppose real existence, ultimately focus on compositional forms existing in nature. In the wider context of this essay, this implicitly contrasts this conjecture with contemporary realism's wholesale acceptance of the ontological commitments of every science. It implies that the postulates of a given science, which at least initially may be delimited by the conception of natural causality or the principle of change it presumes, will belong to one or another domain of natural existence whose "entities" are rather a certain level of nature's reality, i.e. they denote natural entities with respect to a certain conception of their real existence.

At the same time, Plotinus maintains that natural reality is more properly or perspicuously conceived in terms of coming-to-be as such and its real causes. Insofar as cognition postulates or presupposes real *causes* for natural existence and its coming-to-be, it ultimately focuses on forming-principles, whose constituent real potencies or productive actualities effect natural substances and comings-to-be. In this context, 'cause[s]' and 'effect[s]' denote a metaphysical process or relationship rather than those presumed and investigated by science. They connote that, although a lower level of reality is as such not reducible to a higher or deeper level, the former may be properly thought of as an image, manifestation, trace, or vestige of the latter.<sup>160</sup> This aspect of Plotinus' conjecture implicitly contrasts it as well with contemporary realism's commitment to spatio-temporal indexicality or continuity as fundamental to individuality in nature. More precisely, a second metaphysical conjecture which I shall impute to Plotinus distinguishes two sorts of individuality, one contingent and the other modal; and it proposes that the former is less real than, or is properly explicated by, the latter. In previous terms, the former is an image or vestige of the higher, more real individuality ultimately of Plotinus' forming-principles.

To a degree, this second conjecture is already patent, for example, in Plotinus' insistence that Socrates' forming-principle is most truly the *real* Socrates and in his related comparison of Socrates' qualitative (and also his corporeal) existence with a painted semblance of Socrates, since Plotinus associates spatio-temporality with qualitative and corporeal existence. This comparison, however, is imperfect on at least two counts. First, Socrates' forming-principle is not another Socrates but the same Socrates as the corporeal and the qualitative (as well as the composite) existents which also answer to Socrates' name. Second, Socrates' forming-principle "brings with it" his corporeal and qualitative (as well as his composite) existence inasmuch as the latter, and therein also his spatio-temporal existence,<sup>161</sup> are encompassed by his forming-principle as their metaphysical cause.

On both counts, moreover, Plotinus' forming-principles differ from the *natures* which we have seen contemporary realists ascribe to scientific entities. If we allow that an entity's actual past, present, and future behavior and even its putative behavior in contrived, possible, or contrary-to-fact contexts is due to its nature, it may then seem reasonable to suppose that its nature also would insure that it remains the same individual as science (in Cartwright's metaphor) takes it apart and reassembles it in various actual or possible contexts. But, an entity's nature could at best insure that *if* subsequent to an actual or possible contextual transposition a certain entity would be the same individual as a certain actual spatio-temporally present entity *then* not only would its nature account for its behavior in that new context just as it does here and now but this nature would belong to the same individual. Whereas, in contextually taking apart and reassembling a Plotinian forming-principle, science is transposing the individual as such since a real entity does not merely "have" a forming-principle but in reality just *is* a certain forming-principle.<sup>162</sup> Its behavior in some new (actual or possible) context would not merely be due to the same forming-principle but the same individual would thereby be causing or manifesting this behavior—in part, too, because its present spatio-temporal existence is itself due to the forming-principle which it in reality just *is*. Indeed, that spatio-temporal indexicality or continuity cannot insure the modal individuality required by scientific entities may be explained by its being a *contingent* manifestation or vestige of this latter (modal)

individuality; whereas, for contemporary realism this deficiency is due to the fact that spatio-temporal indexicality or continuity is presumed to be the individuality most proper to natural entities, so that they as such are incapable of transposition into or across scientific contexts.

Especially pertinent for any further elaboration of this second conjecture is Plotinus' conception of materiality or matter, which various Ancient and most Modern philosophers suppose constitutes the reality of nature and its coming-to-be. We have seen that for Plotinus corporeal and(or) qualitative existents are entirely passive with respect to coming-to-be. In this, these two domains are emblematic of two fundamental aspects of materiality, and of spatio-temporality as well. The reality of corporeal existents resides mainly in their status as instrumentalities for soul-like movements or potencies of compositional forms and forming-principles; and the reality of qualitative existents resides mainly in their status as substrates for interrelational demarcations of natural substances and for qualitative (accidental) ascriptions, including those pertaining to sense experience. Now, insofar as spatio-temporality is a feature or a relationship among certain features of corporeal and(or) qualitative existents, it is entirely an effect ultimately of the forming-principles' metaphysical causality, and so it may be an index of individuality just for corporeal constituencies and instrumentalities, or for interrelationally demarcated substances and the substrates of qualitative existence. But, the putative reality of an instrument is as such exhausted by its instrumental *functions* or *capabilities*; and, not only is the putative reality of a substrate for (external) relations and accidental ascriptions as such exhausted by this particular function, but it is therein a substrate only for contingent demarcations, ascriptions, or assertions.<sup>163</sup> This latter point especially would explain why spatio-temporal indexicality or continuity can at best impart a contingent individuality to natural entities even though their own deeper reality is neither corporeal nor qualitative, nor accidental or contingent. The former point may also suggest that the aim of scientific investigations or experiments which consider natural entities otherwise than just in their actual context or natural environment is to probe corporeal existents' capabilities as instrumentalities for natural or technologically induced comings-to-be, or qualitative existents' capabilities to manifest these in diverse ways or contexts—even though these

capabilities could then be ascribed to the natural existents themselves only contingently.

One caveat, at least, is in order regarding my proposal that a Plotinian realist might appeal to something like Plotinus' forming-principles to explicate the transposition of real individuals into or across scientific contexts. This caveat introduces an aspect of Plotinus' scheme ignored in this essay thus far, viz. its universalism concerning natural existence. Plotinus' conception of qualitative existence, for example, implies that an Accidental or a Derivable substance may be delineated ultimately in relation to every other substance or external state-of-affairs whatsoever. But, he also considers the interrelated totality of all qualitative (and, likewise, of all corporeal) existents to be itself a manifestation or vestige of a fundamental unity to nature, whereby it indeed constitutes a natural *universe*. This unity partly derives from Plotinus' forming-principles constituting a kind of interrelated totality as well; but he also ascribes a deep-unity to nature itself, imbuing it with a soul or forming-principle which seems meant to supplement and not merely canvass the forming-principles of individual entities.<sup>164</sup> This supplemental forming-principle seems meant to serve as forming-principle for natural existents which are not reasonable candidates for real individuality, e.g. such mass-entities as rivers and mountains or such proper-parts of nature as volcanoes and the heavenly circuit.<sup>165</sup> It might also be meant to serve as a kind of coordinating or ombuds forming-principle for the ways in which corporeal and qualitative existence interrelationally manifest the deeper reality of individual entities' forming-principles and their constituent productive potencies—both as such and in consort with its own role as forming-principle for mass-entities and proper-parts of nature. Perhaps, too, contextually artificial or highly contrived scientific investigations and experiments (e.g. those of deep Physics) may then be construed as indeed not pertaining to real entities but to manifestations or vestiges of this supplemental reality or metaphysical cause of universal nature.

### 11.3     Two Epistemic Conjectures

Contemporary scientific realism, we have seen, is just realism with respect to scientific entities. Plotinus is already a realist

concerning the objects of human cognition, including science and sense experience. His cognitive realism already accommodates science, as a cognitive activity which presumes some conception of natural causality or a principle of change. A Plotinian *scientific* realist, then, might be characterized as a realist with respect to natural existents insofar as they may be cognized as instances or consequences of natural causality and change. Insofar as cognizing and investigating natural existents in such a manner presumes in particular that they comport with a certain principle of change in cognitively discernible ways and respects, this conceives natural coming-to-be or movement to be ineluctably rule-governed or lawful. The traditional conception of science's distinctive status as discerners of nature's laws, in other words, would be fundamental to a Plotinian's scientific realism.

This traditional conception of science's distinctive cognitive aim may be more explicitly related to Plotinus' metaphysic of nature by imputing to him two epistemic conjectures concerning human cognition. The first resembles Popper's conjecture about theoretical constructions in science. It attributes the truth-bearing capability of cognition primarily to its form instead of its content. Insofar as a cognition of some natural existent may be thought of as a conceptual representation of it, the conjecture might state that a true conceptual representation more perspicuously cognizes a real existent the less its truth is due to the particular way in which it represents that existent and the more its truth is due to its own conformity to rules governing the construction, formation, or warranted assertion of conceptual representations pertaining to the domain or level of natural reality wherein it locates it.<sup>166</sup> The second conjecture proposes that scientific cognition encompasses instead of ignores the real objects of our other cognitive activities, including sense experience. Science, in pursuing its distinctive cognitive aim, supplements rather than supplants our other cognitive activities in the interwoven fabric of human cognition inasmuch as discerning nature's laws may be conceived to involve conceptually representing the rules which lawfully govern natural existents at least partly by rendering explicit formational rules governing cognition generally. Insofar as a law of nature may be thought of as a certain way in which comings-to-be comport with some principle of change and cognitive formation rules may be thought to manifest themselves most explicitly in conceptually

necessary cognitions, this would imply that discerning a law of nature may involve recognizing pertinent conceptual necessities when investigating comings-to-be as manifestations or vestiges of nature's laws, or lawfulness—or, perhaps, that discerning a law of nature is a joint cognitive product of certain pertinent conceptual necessities and applying a certain principle of change to natural existents and phenomena.

Plotinus maintains, when we locate his metaphysic of nature within his wider metaphysical system, that human souls and nature's forming-principles are all manifestations of a single higher-order metaphysical principle, his hypostasis Soul,<sup>167</sup> which itself derives from a yet higher-order principle of reality, his hypostasis Intellect.<sup>168</sup> Two features of Intellect seem especially pertinent here.<sup>169</sup> Intellect—the archetype of all intellectual activity—and the object(s) of its activity are not distinct existents. Intellect does not, for example, construct representations of its purported objects; rather, its archetypal intellectual activity effects its object(s) as such, without reference to anything other than the reality of Intellect itself, or of this archetypal intellection. Second, Intellect's archetypally productive activity is unendingly (or timelessly) continual such that it *systematically* effects its object(s)—or so that it may be thought to effect an archetypal *system* of intellectual objects, or intelligibles. In previous terms, we might say that in absolutely pure intellectual cognition there is no representational content but only conceptual form—or, perhaps, that its content is exhausted by its form—and that the form of each such cognition would systematically relate it to every other such cognition in some archetypal (necessary, noncontingent) fashion. An appropriately similar remark would apply to nature's forming-principles, and so to their manifestations or vestiges in the domains of compositional form and of corporeal and qualitative existence. Plotinus, accordingly, identifies his archetypal intellectual activity as also archetypal truth, so that the two features of Intellect glossed above seem to foreshadow such notions of conceptual necessity as “the predicate is entirely contained in the subject” and the derivability of theorems in an axiomatized formal system.

The foregoing by itself suggests the first epistemic conjecture. The second conjecture also seems implicit when we recall that the real objects of every (true) cognition concerning natural existents are nothing other than those effects of the hypostasis Soul whose

highest or deepest reality Plotinus identifies as nature's reason-principles. I have claimed that this encompasses the objects of sense experience, so that sense experience itself becomes a (lowest) kind of intellectual cognition insofar as its objects are in reality manifestations or vestiges of the archetypal intelligibility which informs Soul, and so also nature's forming-principles. Like contemporary naturalistic epistemologists, Plotinus recognizes that the distinctive character of sense experience lies in its association with certain natural (corporeal) processes and capabilities, particularly those pertaining to our sensory organs or neurology. He likewise recognizes that the primary objects of sense experience are not those processes and capabilities themselves, nor the phenomenal content of sense experience which these seem somehow to be responsible for, but “external” existents in the natural universe encompassing our body and sensory organs. Plotinus, however, considers this latter point to be epistemically the more important of the two. His own natural epistemology of sense experience, accordingly, places paramount importance on somehow uniting external objects with the internal processes and capabilities by virtue of which we sense experience them. He accomplishes this ultimately by incorporating into his account of the natural aetiology of sense experience the notion of *sympatheia* or cosmic sympathy, as this originally Stoic notion may be incorporated into his metaphysic of nature,<sup>170</sup> and by conceiving sense experience to be a fully-fledged cognitive activity which therefore comports with his realist conception of cognition generally.

Insofar as this conception thinks of our cognitive activities as various kinds or levels of intellectual activity, this renders sense experience intellectual activity which utilizes the instrumentality of our sensory organs and their distinctive processes to cognize its objects, or which is occasioned by our sensorial “unity” with external objects by virtue of nature's cosmic sympathy.<sup>171</sup> The epistemic value of sense experience does not reside in its sensorial processes or phenomenal content but in its actively cognizing natural existents in a manner which implicitly locates them in the system of (lowest level) intelligibles comprising natural reality as this is effected by Soul, at least partly by itself comporting with formation rules and conceptual necessities which govern human cognition generally by virtue of our own souls' status as manifestations of Soul. In sense experience we are not merely

sensorially aware of a certain natural existent which natural *sympatheia* has "united" with that awareness as its object but we therein cognize, for example, a certain *human being*. Plotinus thus characterizes the objects of our sense experiences as in reality "already entirely present among intelligibles";<sup>173</sup> and he likewise characterizes sense experiential cognition as in reality such that an existent therein "comes to be present as something intelligible"<sup>173</sup> inasmuch as, Plotinus claims elsewhere, "sense experience is just the outward image" of a soul's "contemplation of form."<sup>174</sup> Accordingly, the real objects of sense experience do not exist somehow apart or cut off from the rest of natural existence, including as this may also be cognized and investigated by science.

2. For pertinent discussion on a variety of the concepts and issues I shall address regarding Plotinus' philosophy, see Gerson 1994a.
3. Eddington renders this second issue all the more acute when, having insisted that science has demonstrated his scientific table to be the only *real* table, he avers that "our scientific information is summed up in measures... We feel it necessary to concede some background to the measures—an external world; but the attributes of this world, except in so far as they are reflected in the measures, are outside scientific scrutiny" [Eddington 1958, xiii].
4. Reichenbach 1951, 176.
5. Reichenbach 1951, 176.
6. "We must regard our statements of unobserved objects... as conventions, which we introduce because of the great simplification of language. What we know is that if this convention is introduced it can be carried through without contradictions; that if we assume the unobserved objects to be identical with the observed ones, we arrive at a system of physical laws which hold both for observed and unobserved objects" [Reichenbach 1951, 179].
7. Reichenbach 1951, 181.
8. Miller 1987, 356. cf.. Hollinger 1980, 142; Grandy 1992, 228-229.
9. Cf.. Harre 1986, 109; Dupre 1993, 22.
10. van Fraassen 1980, 8.

12. Cf.. Cartwright 1983, 4-10; Miller 1987, 10, 352-356, 367-372, 448-455.
13. Miller 1987, 354. Alternatively, Miller also proposes: "How often must scientists be in a position to claim that [e.g.] unobservables exist, for scientific realism to be true?... [Answer:] whenever a theory postulating unobservables is rationally preferred as empirically adequate" [1987, 366; cf.. 385-390 & 482-485].
14. Classic texts pertaining to the contemporary notion of ontological commitment include Carnap 1937, 114, and Quine's assertion (criticized by Carnap [cf.. Beth 1963, 498]) that "[t]o be assumed as an entity is, purely and simply, to be reckoned as the value of a variable... *to be* is to be in the range of reference of a pronoun... [or] to be reckoned among the entities over which our variables range in order to render one of our affirmations true" [Quine 1963, 13. Cf.. Quine 1960, 242]. For a more recent example, Kuhn's ontological recipe has it that the "similarity classes of natural families or natural kinds" associated with learning the lexicon of a given science or part of science constitutes its own distinctive "phenomenal world" [Hoyningen-Huene 1993, 72, 111, 267].
15. Harre 1986, 60.
16. Miller 1987, 366.
17. Dupre 1993, 6-7. Dupre himself characterizes this as "radical ontological pluralism" [1993, 18].
18. Schlick 1959, 87.
19. Schlick 1959, 99.
20. Schlick 1959, 91.
21. Schlick 1959, 101.
22. Reichenbach 1951, 186; Reichenbach 1953, 101-102.
23. Reichenbach 1953, 94. Cf.. Bergmann 1953, 267-270; Nagel 1961, 90; Hempel 1963, 697 & 701-702; Carnap 1966, 258-259.
24. Cf.. Miller 1987, 357-359; van Fraassen 1980, 13-18.
25. Cf.. Strawson 1963; Goodman 1963; Hempel 1963. Classic elaborations of the phenomenalist approach include Carnap 1928; Goodman 1966.
26. Thus, for example, Reichenbach adds to his above proposal that "[g]oing from the basis *O* to indirect sentences is the same as going from observables to unobservables" [1953, 99].
27. Carnap 1966, 225-226. Similarly, after characterizing theoretical laws by contrast as laws whose terms "do not refer to observables," Carnap remarks that even regarding the theoretical laws *par excellence* of Atomic Physics "[i]t is true that [their] theoretical concepts differ from concepts of length and temperature only in the degree to which they are directly or indirectly observable" [1966, 227]. For a somewhat but not entirely different perspective on this, see Cartwright 1983, 1.
28. Harre 1986, 57.
29. Miller 1987, 359.
30. Cartwright 1983, 19.

31. Quine 1960, 22. Quine himself thus devalues (un)observability concerns in asserting that "observation sentences as we have identified them are just the occasion sentences on which there is pretty sure to be firm agreement on the part of well-placed observers" [1960, 44] and arguing that questions of ontology cannot be resolved by experiment or observation because "such issues are connected with surface irritations in such multifarious ways, through such a maze of intervening theory" [1960, 276]. Yet, Quine stubbornly insists that "[w]hat reality is like is the business of scientists, in the broadest sense, painstakingly to surmise; and what there is, what is real, is part of that question" [1960, 22].
32. Harre 1966, 109.
33. Dupre 1993, 4.
34. Dupre 1993, 88. Cf. Hawkins 1964, 114.
35. Dupre 1993, 185. And, regarding the purportedly single science at which all theory reductions are presumed to aim, Cartwright argues: "In physics it is usual to give alternative theoretical treatments of the same phenomenon. We construct different models for different purposes, with different equations to describe them...No single model serves all purposes best" [1983, 11].
36. Cartwright 1983, 19.

43. Hawkins 1964, 185.
44. Harre 1986, 280.
45. Harre 1986, 292.
46. Harre 1986, 304.
47. The way in which John Locke's I-know-not-what account of material substance played into George Berkeley's hands may be instructive here.
48. Hawkins 1964, 178-180.
49. Hawkins 1964, 118.
50. Harre 1986, 296. Harre considers Ernst Mach's 1893 work on inertia to be an especially relevant antecedent to this notion: "The essence of Mach's analysis is simple...Why should inertia, the disposition to resist acceleration, be an intrinsic property of each material body, when all other mechanical properties are relative to the rest of the system? The most conceptually coherent stance is to treat it as a disposition grounded in the properties of the universe as a whole" [1986, 295]. Having insisted that deep Physics "transforms nature," Harre attempts to support his current proposal to "ground" its postulates in nature by employing a gambit similar to one employed by some recent naturalistic epistemologists [see below] to argue that "[t]he principle of

- complementarity [or duality] reflects the fact that we can make two kinds of glub-squeezing apparatus—so there are particle-like electron phenomena, and there are wave-like electron phenomena. Apparatus, like anything else, must be just glub, squeezed into some form or other. The universe at large is that which shapes up largish things like apparatus, just as apparatus shapes up particulate electron phenomena" [1986, 305].
51. Miller 1987, 522.
  52. Miller 1987, 527. In this, Miller serves up a clear illustration of how some recent realists conceptually link scientific entities to experimental apparatus, conditions, and outcomes. More pertinent for Miller's technically more detailed analogue to Harre's ultragrounding is his intent that this technical argument buttress his conceptual argument that "[q]uantum physics tells us how states of whole systems govern probabilities for events to happen, and this governance is not the product of causal powers or tendencies of entities or events in the system," so that "the many observed phenomena of superposition cannot be explained as due to characteristics of individual events in a dynamical system, but can be explained as due to the quantum state of the system as a whole" [1987, 542 & 556].
  53. Miller 1987, 592.
  54. One way to elaborate the significance for individuality of Harre's and Miller's approaches is by way of Carnap's stipulation that "[w]e use the term 'individual' not for one particular kind of entity but, rather, relative to a language system *S*, for those entities which are taken as the elements of the universe of discourse in *S*, in other words, the entities of lowest level (we call it level zero) dealt with in *S*, no matter what those entities are" [1956, 32]. Accordingly, if a logicist analysis of the language of deep Physics has it that its level zero lexicon is comprised just of the terms by which it distinguishes its natural kinds (e.g. which denote the quarky attributes of spin, charm, *et al.*), these would be its individuals. But, Harre's affordances and Miller's eigenstates or quantum properties are not Carnapian level zero entities; their level zero lexicons would in effect be comprised of a single term, e.g. *ur-stuff* or *the universal system of nature*.
  55. Reichenbach 1951, 81, 86, 158.
  56. Hintikka 1992, 31.
  57. Cartwright 1992, 50.
  58. To be sure, the charge that science contrives or idealizes its investigations is not inherently problematic. Hawkins thus argues *pace* Positivism that in Newtonian science "[w]hat distinguishes [causal or scientific] laws from mere generalizations is, rather, the claim of unconditionality. Bodies interact, and the behavior of any particular body is contingent on the environment of other bodies. But the way in which it is thus contingent is specified *completely*. This completeness

is, we have seen, equivalent to the claim that a mechanical system can be isolated, that, when the forces acting on it are specified, *no other aspects of its environment are relevant* to its behavior" [1964, 121; cf., 127]. The charge becomes problematic when articulated to portray science as therein contriving or idealizing the entities, phenomena, or systems—e.g. Harre's electron phenomena, Cartwright's charge interactions, or Suppe's physical-system replicas—to which its laws apply.

59. Suppe 1993, 118. Cf., Cartwright 1983, 15.

60. Harre 1986, 104 & 120.

61. Dupre 1993, 63 & 66. The complex of issues to which Harre and Dupre are responding is intimated, for example, in Putnam's proposal that "[a] natural kind term...is a term that plays a special kind of role. If I describe something as a *lemon*, or as an *acid*, I indicate that it is likely to have certain characteristics...but I also indicate that the presence of those characteristics, if they are present, is likely to be accounted for by some 'essential nature' which the thing shares with other members of the natural kind. What this essential nature is is not a matter of language analysis but of scientific theory construction" [1977, 104]. Note especially Putnam's blurring together of scientific natural-kinds and, as it were, commonplace natural-kinds. Many scientific natural-kinds, however, are postulated with no regard at all for commonplace natural-kinds. Moreover, what science is interested in the essential nature of lemons? Or, conversely, what nonscientist (or society) postulated chemical acids?

62. Hoyningen-Huene 1993, 98 & 120.

63. Hawkins 1964, 111.

64. Hawkins 1964, 169.

65. An example is Harre's notion of *referential grids*, which he bases on "the assumption that the ground for acts of reference by the community of physical scientists must be some differentiated extension...Strong exclusion relations must obtain between individual beings composing the field and the target of an act of reference if it is to be capable of being used as a ground" [1986, 125]. Chief among these strong exclusion relations are space and time: "In sum, then, we need a spatio-temporal grid in order to make reference possible" [Harre 1986, 127].

66. Suppe 1993, 118.

67. Cartwright 1992, 49.

68. Minimally, as Cartwright sees it, "when we associate a particular principle of change with a given structure or characteristic, we expect that association to be *permanent*" [1992, 47]; and, when this association is a consequence of some experimental condition(s), "we are prepared to assume that the situation before us is of a very special kind: it is a situation in which the behavior that occurs is *repeatable*. Whatever happens in this situation can be generalized...across varying external conditions" [Cartwright 1992, 51].

69. For example, Russell posited that a particular "will be something which is concerned in the physical world merely through its qualities or its relations to other things...But when I call something a 'particular,' I do not mean to assert that it certainly has no structure; I assert only that nothing in the known laws of its behavior and relations gives us reason to infer a structure" [1954, 277].

77. Fetzer 1993, 41.

78. Suppe 1993, 121. Cf., Cartwright earlier.

79. Of course, science may not be unique in this regard. Kuhn, for example, maintains that an empirical concept—whether or not also a scientific one—"can't be learned in isolation from other empirical concepts. Each concept is rather introduced...into a preexisting net of mutually correlated concepts...[and these] mutually correlated concepts constitute a whole, such that the individual constituent concepts aren't independently existing parts or elements of this whole but...are nothing outside the whole" [Hoyningen-Huene 1993, 100]. Or, as Harre summarizes the theme, "the essences of human cognitive processes and structures are semantic networks, webs of meaning held together by ordered sequences of analogies" [1986, 7]. For additional perspective on the conceptual schemes notion, cf., Crumley 1989; Sellars 1968, 116-150. Nevertheless, its roots are in philosophy of science. In this regard, an important influence not explored here is discussion of so-called scientific revolutions: cf., Kuhn 1970; Cohen 1981. Some contemporary realists even maintain that this cognitive or conceptual isolationism is in fact a virtue instead of a liability in argument for scientific realism: cf., Boyd 1992, 143; Grandy 1992, 229-230.

80. Cf., Mulkay 1985.

81. Grinnell 1992, 155.

82. Harre 1986, 94.

83. Quine 1969, 82-83.

84. Harre 1986, 156. For a more detailed explication of Gibsonian theory and its relevance to epistemology, e.g. by way of functionalist notions, see Machamer 1978, 437-440 & 444-446. Gibsonianism does have venerable antecedents, e.g. Aristotle's notion that "an eye, for example is made of certain materials (*which* materials being unimportant for the present purpose) that are naturally and normally in a certain ratio to one another... When suitably stimulated by the medium's transmission of motions from a molar physical thing that has active 'color power' (my

- expression), the eye takes on a ratio that is formally akin to, or, if you please, identical to, a certain ratio in the thing (which is or produces its 'color power'). Thus the eye takes on the form of the sensitive object without its matter" [Turnbull 1978, 22-23].
85. Hoyningen-Huene 1993, 40. In this regard, Kuhn also "employs a metaphor borrowed from computer science. The basic idea is that of some programmable and reprogrammable neural apparatus, situated between the organs that receive perceptual stimuli and perception itself, that is responsible for processing perceptual stimuli into actual object perceptions. Learning similarity relations can be understood as a way of programming, or reprogramming, this neural apparatus" [Hoyningen-Huene 1993, 84-85].
86. Hoyningen-Huene 1993, 57.
87. Boyd 1992, 144-145.
88. Sellars 1963, 1-40.
89. Of course, Sellars' distinction does not assert a sharp conceptual demarcation between scientific-image science and other (or previous) science.
90. Sellars does argue in later work for a conception of scientific realism which maintains that "a correct account of concepts and concept formation is compatible with the idea that the 'language entry' role could be played by statements in the language of physical theory, i.e. that in principle this language could *replace* the common-sense framework in *all* its roles" [1968, 146]. Here too, though, Sellars in effect cautions that this does not imply that the objects of sense experience and (or) routine cognition do not exist, or are unreal: "We must distinguish carefully between saying that [certain] objects do not really exist and saying that they do not really exist *as conceived in [a certain] framework*...To say that an object doesn't exist *as conceived in* [one conceptual framework]...is to claim that there are significant differences between the way in which the object is conceived [in that framework] and the way in which it is conceived [in a second framework]"—e.g. in first a common-sense framework and then a scientific framework [1968, 148-149].
91. In every case, the reality denoted on the right is more real than that denoted on the right, inasmuch as the right-side denotes the metaphysical cause (*aitia*) or source (*arche*) of the reality denoted on the left.

160. Regarding the implied relationship here between higher and lower levels of Plotinian reality, see Fielder 1976; Fielder 1978; Fielder 1982; Wagner 1986, 60-62. Cf. *En* I.6.8-9; II.9.3.
161. Regarding the metaphysical source of spatio-temporality, see especially *En* III.7.11; VI.5.11. Cf. Manchester 1978; Strange 1994.
162. In this regard, Plotinus at one point portrays his Intellect's systematic generation of intelligible form as culminating in "uncutables," or *atomai* [*En* VI.2.2.13]. This may refer to the intelligible reality which Plotinus insists upon according even to purportedly "simple" bodies—e.g. air, earth, fire, and water. But, in context it more likely refers to the distinct intelligible reality of each individual entity in nature—a Plotinian analogue, perhaps, to Leibniz's identity of indiscernibles.

163. Of course, we have also seen that instrumental functions or capabilities, though not as such realities or real existents, may be ascribed only to actually real existents. This suggests that the second aspect of materiality is in fact more fundamental than the former; it, in effect, is *the* fundamental aspect of materiality for Plotinus. With respect to its function as the ultimate substrate for (external) relations and accidental ascriptions, including ascriptions of instrumentality, matter may be properly characterized as *privation* inasmuch as "the opposite of all form is privation; but, privation is real only in relation to something else and has no reality of its own" [*En* I.8.11.1-3]. Though Plotinus at times uses language suggesting that matter in some way affects whatever may descend towards it (e.g. *En* I.8.14.38-44; II.9.11.1-13; III.6.14.5-10; III.6.18.28-30), strictly speaking "matter cannot be isolated as any kind of pre-existent darkness, for there is no pre-existence either temporally or ontologically" associated with the metaphysically productive movements or potencies of Plotinus' real causes [Rist 1967, 117]. For pertinent discussion, cf. Rist 1961; Rist 1962; Armstrong 1967, 256; Lee 1979; O'Meara 1980; Corrigan 1985, 47-49; Simons 1985; Wagner 1986. Regarding matter as substrate, cf. *En* I.8.10.2-4; II.4.6-14; II.5.4-5; III.6.7.1-5; IV.3.9.24-27; VI.5.11.
164. Cf. *En* II.9.7.29; III.2.3.7-9; III.2.15.2; III.8.2; IV.3.7-10; IV.4.10-12; IV.4.32-38. For pertinent discussion, see Deck 1967, 74-80; Rist 1967, chapters 8-10; Wagner 1985, 288-290; Wagner 1986, 71-81; Gurtler 1988, chapters 1 & 3; O'Meara 1993, 65-78.
165. A contemporary Plotinian might add the postulates of deep Physics to these examples.
166. Elsewhere, I broach this in terms of a distinction between Real-truth and Accidental-truth for Plotinus: Wagner 1985, 285-286.
167. Regarding the strict propriety of referring to Plotinus' primary metaphysical principles as *hypostases*, see Anton 1982; Deck 1982.
168. Regarding souls' and cognition's relation to Intellect, see *En* I.1.9; II.9.1.33; III.5.7.50-54; III.6.2.32; IV.3.1; IV.4.12; V.9.3.31-39; VI.5.11; VI.9.5.10-13. As Inge puts it, Plotinus "has found in the creative Reason which is at once in our minds and the formative principle of the world, the bridge between thought and thing" [1929, 57]; and Brehier remarks that since the Intellectual Realm "appears as a series of Forms each of which depends hierarchically on the preceding... the universe can be the object of rational thought" [1958, 43]. Cf. Schiller 1978; Wagner 1982a, 58-59.
169. Cf. Findlay 1982; Wagner 1985, 280-284; and *En* III.6.6.1-33; III.8.11; IV.3.4.9-11; V.1.4.26-45; V.1.7; V.4.2; V.5.2; V.5.7-10; VI.2.7-11; VI.2.21; VI.7.13-17.
170. Cf. Gracsec 1972, 105-111; Gurtler 1988, 90-137.

## Teleology Revisited: A Neoplatonic Perspective in Evolutionary Biology

Peter Manchester

Aristotle had complained, about Platonists or "friends of the ideas," that they had a perfectly sound understanding of the formal and material causes, but did not know how to invoke the moving causes—the efficient and final causes. Neoplatonism responded to this challenge with an adaptation of the well-known Stoic doctrine of *σπερματικοὶ λόγοι*, "seminal λόγοι." A characteristic use of the image is in Plotinus, "On Eternity and Time," where he says that eventuation in time is "a *λόγος* unfolding itself as though from a resting seed."<sup>1</sup>

The familiar exposition of this doctrine is badly attuned to the state of theoretical questions in contemporary biology. It sounds to biologists like *homunculi*, whereas, as I will argue, the "unfolding *λόγος*" is an account of teleological causation that ought to be acceptable and productive in biological explanations of the emergence of living forms—on each of the frame-scales of time in which individuation takes place.

I want to argue that already in Aristotle a *τέλος* is a *natural* cause, and teleological explanation not just a valid but a necessary component of complete explanation in biology. But the Neoplatonic development of the self-unfolding *λόγοι*, rigorously expounded, is even more evidently useful and productive in evolutionary biology.

### I. Context

There are many good reasons why explanations that imply teleology are rejected in modern biology, which is to say, in evolutionary biology.

First, teleology is associated with theism and the medieval transposition of the myth of creation into metaphysics. Specifically, there emerged a teleological argument in theology: that the suitability for their ways of life seen in living forms establishes that they were made "on purpose." When structured as a proof for the existence of God, this is called the argument from design. The God that is arrived at, so far as he is a maker, is the supplier of a τέλος—end, term, goal (Latin *finis*)—for each living thing. This position was blind historically to the transient character of species in evolutionary time, assuming that all genera and species are everlasting. It was also the paradigm of supernatural explanation of living forms, a mode of explanation that simply preempts any possible empirical research.

Second, teleology is the inevitable recourse for accounts of evolution for which the emergence of human reflective intelligence was somehow a goal of the origin of species from the beginning. A profound methodological problem arises for any such theoretical construct—call it observer bias. In a cosmological context it is called the anthropic principle: things are as they are so that we could be here. Empirical biology must renounce this kind of presupposition.

Finally, teleology suggests that speciation itself is an expression of purpose: reptiles adapted their forelegs to be wings so that they could fly, etc. Here biology in the past century has asked for a *mechanism* to be demonstrated whereby physiological variations among individuals could be selected for in the interest of a new capability. Or rather, I should not say selection in the way I just did, as selection "in the interest of a new capability," because classic Darwinism refuses to let the notion of 'selection' become purposive or intentional. The 'matter' on which selection acts such that changes of 'form' take place is *variation*, and just as 'selection' is treated as mechanically as possible, so also variation is assumed first of all to be stochastic—i.e. random and undirected. These theoretical reflexes of the biologist are not reductionist, but express instead an important methodical restraint. Evolutionary biology understands *very well* what it tries to identify and suspend wherever it rears its head: it calls it *teleology*, but what it really means is the supposition of occult or 'spiritual' causes about which, as an empirical science, it can be at best agnostic.

## II. A Platonic Problem

The unit of selection in biological evolution is the species, not the individual. This is the most general way in which to state the consequence for modern biology of the defeat of Lamarckism, which postulates the inheritability of individually developed traits.

But precisely in this role, as the concrete subject of whatever causes operate to evolve new species from prior ones, species exist in *two dimensions*: On one hand, a species is a population of individuals sharing morphological and behavioral characteristics that suit them to share a common niche in an ecosystem, and to be reproductively closed among themselves. This is the species studied in taxonomy—in both synchronic and, via the fossil record, diachronic taxonomy or the elaboration of evolutionary 'trees'.

On the other hand, a species is a gene pool, a DNA structure shared with only minor variations by all individuals in the population. The advent of chromosome mapping and the increasingly remarkable capability of recovering and sequencing DNA from fossils has led to the emergence of an independent and powerful tool for confirming, and sometimes correcting by genetic analysis, evolutionary derivation trees based on morphology and geological stratigraphy.

How is the relation between these two ways in which species are present to be understood? Neoplatonism has done some very valuable thinking about just this question—or rather, on an analogous question, where I shall first have to state briefly and then to defend the analogy.

In broad Platonic terms, the DNA-species is the eternal εἶδος, the population species is the participating individuals. Biology speaks of the genotype and the phenotype in making the same distinction.

In Platonism, the εἶδος or genotype is eternal. It is routinely supposed that a notion of the eternity of species precludes any insight into the evolution of species, because to say that the εἶδη are 'eternal' implies that they are 'fixed' or 'static,' unchanging. But this is simplistic concerning the notion of αἰών and the αἰώνιος, the 'eternal.' The eternal is not the αἰδιος, the everlasting. Its resting (μένων ἐν ἐνί, *Timaeus* 37d) is not logical stasis but what biology calls homeostasis, a self-sustaining order or pattern in which a participating lower order of motion (sensible

κίνησις, e.g. metabolism regarded as biochemical pathways) maintains itself. Αἰών is not something extensive about time, but something *intensive*—cohering with the most ancient senses of the term as life or prevailing-life-principle.

The elemental Platonic distinction is between an intelligible and originating dimension of things and the dimension in which things are in sensible motion or the process of coming-to-be and perishing (τὰ ἐν γενέσει). It is not a 'two-worlds' theory, but a distinction intrinsically well suited to illustration from biology, where an organism's DNA is intelligible (we speak of its 'code') and originating (directing protein synthesis), and only the living and developing organism itself actually comes to be and perishes in a metabolic sense. Since the time-frames in which DNA patterns themselves move and evolve are only incidentally related to those of the phenotype and its ontogenesis, they transcend the time of individuals and can quite properly said to be *eternal*—if eternity is understood as sketched above. Since the defining feature of the eternal is not its extension through time, but its relationship to forms or patterns enacted in that extension, there is no obstacle at all to assigning an evolutionary aspect to the plurality of εἶδη in Platonism, which is to say, to eternity itself.

This becomes all the more evident in Neoplatonism, where one of the most easily observed modifications of Platonism is the almost complete displacement of the εἶδη by λόγοι. We need to digress for a moment to lay out a context in which to appreciate the importance of this shift for biology.

### III. Causing In Aristotle

For Aristotle, it requires the correct integration of four distinct kinds of explanation to account for the being of a natural entity. This is usually referred to as the doctrine of the Four Causes.<sup>2</sup> Let me present them in the form of a simple chart:

### TELEOLOGY REVISITED: A NEOPLATONIC PERSPECTIVE 77

	<p>οὐσία form, essence, the "What" it was to be; the "Formal Cause"</p>	
<p>the ἀρχή of motion: its beginning or effector the "Efficient Cause"</p>		<p>the τέλος of motion its end, term, finish (Latin <i>finis</i>); The "Final Cause"</p>
	<p>Matter: what persists in presence through change; the "Material Cause"</p>	

Each of these four patterns of explanation is exhaustive. They are equiprimordial. That is to say, each, in its own way, explains everything: there is nothing left out. An organism, for instance, is entirely a material being. Yet it is also an ongoing metabolism, matter in which motion has been instigated—for example, nutrition. It is also a phenotype of a species, an οὐσία subject to identification and classification. And finally, insofar as it is growing, maturing through a life-cycle, and behaving in ways that subserve reproduction, its motion has to be understood teleologically. For Aristotle, it is knowing how to integrate these four αἰτίαι or modes of explication that constitutes knowledge of being.

In an organism or living being (Aristotle's ζῶον), the formal cause is intimately linked with the efficient and final causes to comprise the 'soul' (ψυχή) as he understands it. What it means to be ensouled is, in effect, to have one's own 'onboard' efficient and final causes. Now in general, there is for Aristotle a kind of complicity or coordination between the efficient and the material causes, on one hand, and the formal and final, on the other. Hence in the reductionist material philosophy and physical mechanics of the 17th and subsequent centuries, it is not surprising that the idea of 'cause' is wholly given over to efficient causality. But it is the conjunction of formal and final causes that leads in directions useful for biology. It is reflected in the use of the imperfect past tense in the Aristotelian technical phrase for essence as formal cause, "the 'what' it was to be" (τὸ τί ἦν εἶναι). This names the

adult or reproductively mature individual in relation to its gestation, growth, and development: the butterfly is "what the caterpillar was going to be." The same vision of living as the enactment of changes directed to a formal end is also expressed in the term for 'actuality' that Aristotle prefers in natural science and especially biology, ἐντελεχεία, 'entelechy', which is ordinarily construed to mean 'holding or achieving completion' (ἐντελής ἔχειν), but as Aristotle uses it carries the more compounded sense of 'tending into or toward an end' (ἐν τέλος ἔχειν).<sup>3</sup>

Precisely a desire to think the εἶδος of a living being operating as a τέλος of its unfolding development leads to the Neoplatonic displacement of the εἶδη by the λόγοι. While εἶδος is certainly not 'form' (the common translation), which needs to be reserved for μορφή, it is still true that because of the term's association with vision and the visible, it naturally tends to imply a simultaneity-structure rather than a developmental pattern. Λόγος, on the other hand, is naturally associated with time. Already Aristotle *On the Soul* had used λόγος to name such things as the perceptual quality of sound,<sup>4</sup> which taken materially is vibration, but as audible is 'modulated' by a λόγος that the soul re-enacts in hearing. In such contexts, one usually translates λόγος as 'ratio' or 'proportion', having in mind the relationship between frequency (a physical determination) and pitch (a perceptual one). This is almost certainly too mechanistic: it means more generally intelligible pattern, almost 'rationale.' But in particular—as illustrated by its application to sound—λόγος is well suited to name an intelligibility enacted over time, a phase-series or developmental sequence.

With this, we are brought back to Plotinus' "λόγος unfolding itself as though from a resting seed." Only now, we are in position to see that far from being a simple appropriation of the Stoic λόγοι σπερματικοί, the Neoplatonic λόγοι are precursors of how contemporary biology understands the nature and role of DNA genetic sequences. Indeed, the λόγοι are no more 'seeds' than DNA is—or better, are 'seeds' in exactly the same way.

#### IV. Teleology

We are all familiar with the notion that the DNA 'code' of a living species determines the adult form of engendered individuals. How does it do so? In no way at all is it a precursory version of the adult form that has only to enlarge and perhaps reportion itself. Nor does it provide anything like a 'mold' or 'template' into which material is poured or by which it is stamped. We know that instead and most directly, it specifies protein synthesis, but does so dynamically, in such a way as to direct the course of cell division in embryogenesis (and in cognate developmental metamorphoses like insect pupation).

Consider the development of a large and complex animal from egg to adult. Simply to track and describe the strategies involved in tissue differentiation—on the way from the single cell of initial fertilization, through two, four, eight, sixteen...through the first foldings that differentiate endo-, meso-, and exoderm...into the elaboration of organ and body structures—remains a frontier in contemporary embryology. Even greater challenges to understanding arise from the fact that it is the λόγος of this developmental sequence—its 'logic'—that mediates between the gene pool and the population-species. In the developing individual, the genotype acts as goal or τέλος of development, through the mediation of the DNA-specified λόγος. The adult form is more elicited than produced. This feature of the logic of embryogenesis is so sharply felt that biologists have coined the term 'teleonomy' to describe it, 'teleology' being regarded as discredited. I propose that we think about what we call the DNA 'code' the way that Neoplatonism thought about the λόγοι whose unfolding constitutes the life-course (the βίος) of living beings (ζῶα), and unabashedly recognize it as teleology.

Neoplatonic λόγος determines or causes as a τέλος: in a completely strict way, the Neoplatonic understanding of natural life is *teleo-logia*, teleology. Lurking beneath the objections to teleological thinking outlined at the outset is an assumption that it involves a mistaken idea about time, illicitly postulates some way in which the future affects the present. Hence it is especially valuable that the most explicit Neoplatonic discussion of how λόγοι mediate between eternal intelligible being and sensible process occurs in Iamblichus' account of time. I will conclude with

the presentation and brief explanation of a few of the relevant texts.<sup>5</sup>

Iamblichus' thought about time survives principally in fragmentary quotes and long paraphrases incorporated into the Aristotle commentaries of Simplicius and Proclus. What follows is synthesized from two such places. I introduce Roman numerals to mark two separate elements of a traditional definition on which Simplicius tells us Iamblichus is commenting:

The divine Iamblichus in his first commentary on the *Categories* says that Archytas defines time as (i) "a kind of number of movement," and (ii) "the general interval of the nature of the universe." His exegesis of this definition is as follows:

(i) the movement referred to here is not one of the many (for then the others would be in want of time), nor is it the communion of the many (for such a communion would not be one), but it is the movement which is one in its being, preexisting all the others as though a monad of motions. This is the first psychical change [πρώτη ψυχική μεταβολή], unfolding [ἐκφυσμένη] the projection of the λόγοι; it is justly primary and the cause of all motions.

(ii) the general interval of the nature of the universe includes all the natures of the universe and penetrates through the whole of them entirely. Identified in this way, time begins from above on the level of the first λόγοι and reaches as far as a certain level where, in accordance with the transition [μετάβασις] and movement of the whole λόγοι, it determines the general interval. For in the same way that, with things in process, this Now along with the Now beforehand and this movement along with the first movement are what makes change manifest, so also, in a much prior and more fundamental way, the interval of the most senior time of all is seen as pre-existing with the essence of the whole λόγοι of the natures and, with sovereign propriety, as filling it to completion.<sup>6</sup>

What makes this position not just unfamiliar but unexpected is its distinction of two different dimensions of time. The higher, or 'psychical' time belongs to the hypostasis Soul in its productive descent from the intelligible to the sensible. The lower is physical time, the dimension in which sensible motions appear. This too is a psychical time, in the sense that it is still within Soul, but now it is Soul embodied in physical (natural) beings, so it is time as ordinarily understood, in which motion has its earlier and later

phases. In developing his theory of two-dimensional time, Iamblichus is expanding a theme latent in Plotinus' definition of time as the "life of soul (ζῶη ψυχῆς) in a movement of transition from one lifetime (βίος) to another." This transitional movement is 'vertical' in a systematic sense: it is the movement of Soul from its contemplative proximity to Νοῦς (one of its two βίοι) downward or outward into its production of nature or sensible being (its other βίος). Iamblichus calls this the "monad of motions." In a related remark, recalling the identification of time as "an image of eternity moving according to number" (*Timaeus* 37d), he points out that time moves only in relation to eternity.<sup>7</sup>

We could summarize this doctrine by saying that true or "senior" time is the life of Soul in its eternal movement from eternity into sensible time, which is to say that time is a perpetual arrival into itself. The position is not that there are two 'times,' but rather that time in its very nature is two-dimensional.

But now the argument has interpreted these definitions of time as two, whereas it is necessary to bring them together into one. For thus the whole nature of time will be seen.<sup>8</sup>

The reason Iamblichus seizes upon and elaborates this doctrine is for what it allows him to say about the presence of intelligible order in the growth and activities of natural beings: it is *time* that "projects" the λόγοι upon sensible motion, and "unfolds" the interval-patterns through which they are enacted. For Neoplatonism, time is what we could call the 'engine' of participation—the fully worked out answer to the complaint of Aristotle with which we began.

For the generative time, being, like a time-like monad, the number of self-moving movement, is the interval of the natural λόγοι, not however according to bulk nor with regard to outward movement simply, but it is the interval according to the pre-existing order of movement, in which the earlier and later are arranged beforehand and provide order to actions and movements. For one cannot infer the earlier and later of affairs without the pre-existence of time in itself, to which the order of actions is referred.<sup>9</sup>

In this distinction Iamblichus is exploiting an ambiguity in the term *τάξις*, which can mean both serial order-in-succession and 'ordinance,' deliberated arrangement or purposive shape. In time, only as sensible is the order of affairs purely serial; the pre-existent order is intelligible and purposive:

If we posit 'earlier and later' in this order, we do so not according to the transitions of movements or according to the unravelings of life or according to the pathways of cosmic processes, or anything like this; but we characterize it according to the ranking of causes and the continual concatenation of engenderings and the primordial act and power of motions bringing purposes to completion—according to all considerations like this.<sup>10</sup>

As the 'engine of participation,' time is clearly being understood *teleologically*. And because time is the life of soul, *participation* is the essence of life itself.

To translate this analysis into a Neoplatonic proposition in evolutionary biology: DNA is the Platonic *εἶδος*, understood in an Aristotelian way as harboring the *λόγος* of living beings. Its role in ontogenesis is best portrayed teleologically.

On the level of phylogenesis, the way to apply a Neoplatonic perspective is also clear. The stability that allows for the genetic identification of a species is a kind of homeostasis in time, an *αἰών* in the Platonic sense. Evolutionary biology calls it an 'equilibrium'. In evolution, the eternity of species is itself subject to change. The question is whether such change must also be understood teleologically.

We should not forswear the Neoplatonic answer: of course. Since the entire 'career' of Soul, embodying itself in Nature, is an enactment of *Noûs*, the evolution of species is *Noûs* on its way to itself. Whether this is again the 'anthropocentric' fallacy remains to be seen.

# **Plato, Proclus and Peirce: Abduction and the Foundations of the Logic of Discovery**

**Scott A. Olsen**

The thesis of this paper is that the Neoplatonist Proclus carefully preserved, though purposefully in a somewhat veiled manner, an ancient method of inference that Plato had discovered and employed in the Academy. And further that Charles Sanders Peirce rediscovered, and clearly emphasized the supreme importance of this dialectical technique of scientific discovery. Employed successfully by Kepler and many others, this inferential method is *de facto* the very basis of today's pragmatic success in the realm of scientific hypothesis formation. This is clearly evidenced in its enlightened and successful application by our creative geniuses of the 20<sup>th</sup> century, such as, Albert Einstein and David Bohm. Unfortunately, though employed by intellectual geniuses throughout history (e.g., Kepler was especially proficient and insightful in its use), the method seems to have been somewhat ignored in the realm of "academia." This oversight now needs rectification.

We must begin our discussion with Plato. However, it is important at the outset to make some preliminary background observations regarding my construal of both Plato and Neoplatonism. First, my studies of Plato have led me to the conclusion that Plato was primarily a Pythagorean. Secondly, I take an "accurate" Neoplatonic view of Plato to be in fact an accurate view of Plato. In other words, when successful, Neoplatonism accurately depicts Platonic doctrine. This is not to deny that there are some Neoplatonic developments that are in all likelihood either extensions of or foreign to Plato. But my concern is with that central element of Neoplatonism that attempted to unfold the inner essential, if not esoteric, doctrine of Plato. In my view, Plato was a real midwife, like Socrates. Plato's intent was

not to explicitly set forth his doctrine in the dialogues. Rather he presents puzzles, problems, and incomplete analyses, from which the reader may infer (abduct) the solutions (or adequate hypotheses). See for example Plato's disparaging statements regarding "writing" in the *Phaedrus* (see 274e–275e), his avowed reticence toward setting forth his true doctrine as expressed in the *7th Letter* (see 341c–342a), the statements of Aristotle regarding Plato leaving the solutions to problems an open question in the Academy (see for example, *Metaphysics* 987b9–13, 1028 & 1076), and the entire Indirect Tradition as to the esoteric or unwritten doctrines of Plato (see H.J. Kramer, 1990). There is in fact remarkable consistency between Aristotle, the Indirect Tradition, the Neoplatonists, and Plato's own avowed feelings regarding this issue. It is ironic that some of the twentieth-century's more talented commentators, more interested in pushing their particular interpretations than arriving at the truth, went so far as to claim, as Cherniss once did, that Aristotle (Plato's pupil for 20 years) "misinterpreted and misrepresented" him (see Cherniss, 1945, p. 25). Or as Robinson apparently felt constrained to do, even deny Plato's own express words, lest Robinson's position be contradicted by Plato himself (see Robinson, 1953, p. 183).

As we shall shortly see, Plato elicited in the recipient (listener or reader) a technique of reasoning, in both the Academy and his Dialogues, by presenting a problem, anomaly, or incomplete solution, to which the member of the Academy or reader of the Dialogue was expected to reason backwards or "upwards" to an adequate solution or hypothesis. Throughout history this has been referred to in a variety of ways, such as the dialectical ascent, apogee, reduction, analysis, geometric analysis, abduction, hypothesis formation, novel reasoning, and retrodution. This upward dialectical movement was clearly discerned by Aristotle when he wrote:

Let us not fail to notice however that there is a difference between arguments from and those to the first principles. For Plato, too, was right in raising this question and asking, as he used to do, "are we on the way from or to the first principles?" (*Nicomachean Ethics* 1095A)

In the Academy itself this dialectical method was often conjoined to mathematical discovery, moving upward (as metaphorically described in the Cave and the Divided Line of the

*Republic*), from the visible representations of this lower world, up through the intermediate realm of mathematical, up to the Forms as numbers and ratios, and up ultimately to the First Principles of the Forms, namely the Indefinite Dyad (Greater and Lesser) and the One (the Good), which upon deeper reflection appear to be intimately tied to the golden section and its reciprocal, in relation to unity.

This interrelation of mathematics and abduction (dialectic) was central not only to the techniques and interests in the Academy, but also to the tradition preserved by Proclus, and the rediscovery made by Charles Sanders Peirce (which actually became a cornerstone of the logical technique involved in pragmatism). As we know, the Academy itself was primarily made up of philosopher-mathematicians. Of course recall the tradition that over the doors of the Academy were the words, "Let no one unversed in geometry come under my roof" (Thomas, 1957, vol. 1, p. 387). These philosopher-mathematicians included, for example, Eudoxus of Cnidus, Theaetetus of Athens, Speusippus, Heraclides, Menaechmus, Callipus, Xenocrates, Leodamos, Dinostratus, Neoclides, Leon, and Theudius of Magnesia (see Thomas, 1957 & Olsen, 1983). It is interesting to note that regarding the mathematical emphasis in the Academy, Aristotle, who was much more interested in the strictly dialectical process stripped of a mathematical ontology, remarked in a somewhat "disgruntled" manner:

Mathematics has come to be identical with philosophy for modern thinkers, though they say it should be studied for the sake of other things. (*Metaphysics* 992a 32–34)

The tie between the mathematical and the dialectical has been noted by even some of the most conservative of commentators. Cherniss, for example, remarked:

If students were taught anything in the Academy, they would certainly be taught mathematics...that their minds might be trained and prepared for the dialectic; and this inference from the slight external tradition is supported by the dialogues, especially the seventh book of the *Republic* (Cherniss, 1945, pp. 66–67)

Now before discussing the essence of dialectic, i.e., abduction, it is important to recall that Plato is avowedly reticent about his true doctrines, especially in the dialogues. Both Aristotle and the Indirect Tradition (see Kramer, 1990) make it clear that there was a deeper oral doctrine within the Academy itself. And I would add that this doctrine is subtly imbedded within the dialogues themselves. However, this hidden or esoteric knowledge is very difficult to access in the dialogues, unless you already intuitively, or through personal teaching from Plato at the time, possess the key. It is somewhat analogous to the old story of the person who is looking for her lost spectacles. Ironically she really needs them to be able to find them, *unless someone is present to assist in the process*. As Plato made eminently clear for those with eyes to see and ears to hear:

I don't think the attempt to tell mankind of these matters a good thing, except in the case of *some few who are capable of discovering the truth for themselves with a little guidance*. (7th Letter 341e-342a)

Even though Plato is not absolutely clear in the dialogues as to the nature of dialectic (what I am taking to be abduction), he is unequivocally clear that it is the finest tool available in the acquisition of knowledge. As he says, "Dialectic is the coping-stone that tops our educational system" (*Republic* 534e). And in the *Philebus* he states:

It is a method quite easy to indicate, but very far from easy to employ. It is indeed the instrument through which every discovery ever made in the sphere of the arts and sciences has been brought to light....[It] is a gift of the gods...and it was through Prometheus, or one like him (Pythagoras?), that it reached mankind, together with a fire exceedingly bright. (*Philebus* 16c)

Furthermore, it is the dialectician who can reason backwards to a hypothesis which "can take account of the essential nature of each thing" (*Republic* 534b). But Plato recognizes that all abductions, though pragmatically useful, are tentative unless ultimately tethered to the final abduction of the One. This occurs only when the dialectical ascent is carried sufficiently far that one attains to the vision of the Good:

When one tries to get at what each thing is in itself by the exercise of dialectic, relying on reason without any aid from the senses, and refuses to give up until one has grasped by pure thought what the Good is in itself, one is at the summit of the intellectual realm, as the man who looked at the sun was of the visual realm....And isn't this progress what we call dialectic? (*Republic* 532a-b)

Within the Academy itself this dialectical key was employed in response to various problems, anomalies, and paradoxical situations presented by Plato and requiring creative and intuitive solution. For example, in response to Plato's astronomical question (i.e., the famous example of saving the appearances), Eudoxus responded by creatively abducting and then setting forth an explanatory hypothesis of concentric spheres. Of course he was not the only one to "abduct" an hypothesis to account for the phenomena. Speusippus, Heraclides, and Plato himself, each developed, or retroducted, plausible solutions. However, the hypothesis of Eudoxus more accurately explained the apparent movements of the sun, moon and planets. Menaechmus then followed and expanded the Eudoxian solution. Callipus made corrections on the Eudoxus-Menaechmus hypothesis, which was then adopted by Aristotle. The essence of the Eudoxian solution, based upon a combination of circular movements, went unchallenged until the time of Kepler. Sir Thomas Heath recognized the pragmatic success of the Eudoxian abduction:

...notwithstanding the imperfections of the system of homocentric spheres, we cannot but recognize in it a speculative achievement which was worthy of the great reputation of Eudoxus and all the more deserving of admiration because it was the first attempt at a scientific explanation of the apparent irregularities of the planets (Heath, 1913, p. 211)

This abductive procedure was employed in the Academy in many of the geometric problems. A good example is that of the Delian problem of doubling the cube. But my contention is that the technique is also required to solve the problems presented by Plato in the dialogues. For example, when confronted with the "worst difficulty argument" in the *Parmenides*, abduction leads to the hypothesis of the doctrine of intermediates. Plato, as a true midwife, plants the clues along with the problems throughout the

dialogues. Thus, in the *Timaeus* he performs an incomplete analysis of the regular solids. He is simply being reticent, as the true esotericist (Pythagorean) that he is, about the most sacred part of his mathematics. The reader must abduct the existence of the "golden triangle" and hence the "golden section" as a fundamental component in the construction of the solids (see Olsen, 1983). Plato generally will provide the reader with a pregnant clue, such as:

These then...we assume to be the original elements of fire and other bodies, but the principles which are prior to these Deity only knows, and he of men who is a friend of Deity... anyone who can point out a more beautiful form than ours for the construction of these bodies shall carry off the palm, not as an enemy, but as a friend...he who disproves what we are saying, and shows that we are mistaken, may claim a friendly victory. (*Timaeus* 53a-54h)

Plato, in his dialogue the *Theaetetus*, again provides an incomplete analysis, this time of knowledge. It is necessary for the successful reader to abductively infer the solution. Desjardins recognized this fundamental need for *apagoge*, or abduction, in the *Theaetetus*. In fact she correctly states that it is the "essence of that creative operation" of problem solving and hypothesis formation:

For the solution to the overall problem of the dialogue—"what knowledge really is"—is provided through the mode of problem solving known to mathematicians as "reduction" or *apagoge*...a method used to powerful effect by Hippocrates of Chios and Theaetetus of Athens....Theaetetus' work with irrationals provides the reductive solution to the problem of knowledge...rendering ever more rational what was originally irrational—(this) is, both in geometry and in knowledge as a whole, the essence of that creative operation which we know as the rational enterprise. (Desjardins, 1990, p. 170)

There actually are several variations of abduction, one variety is known as mathematical or geometrical analysis. Many of the abductions occurring within the Academy may have been simply "reductions" of one problem to another. This would be the case in the solving of the Delian problem of doubling the cube, as a reduction to the problem of finding two mean proportionals. On the other hand, the problem of saving the appearances (of the apparent disorderly motion of the planets), would be more an example of

abduction in its generic sense as discovery of a hypothesis which will account for the anomalous behavior or observations. In fact, as we shall see, it is this generic sense of abduction that I maintain lies at the very center of creative discoveries in the theoretical realm of the sciences and other fields, and is the basis of proper paradigm formation, overthrow, and reformulation. But the various distinctions and varieties must be kept in mind.

To fully understand the roots of Plato's abductive methodology, it is important to recognize that he was primarily a Pythagorean. Both his epistemology and his ontology are carefully intertwined, and both are rooted in mathematical principles. It is to the credit of the Neoplatonist Proclus, with his Neopythagorean leanings, to have accurately gleaned from the oral and written traditions, what Plato was really up to. But those commentators who are unwilling to look seriously at Proclus, the other Neoplatonists, and the Inner (esoteric) Tradition, will have to lament at their "loss of the key." As Robert Brumbaugh once put it:

We have probably lost the key to much of the "mathematics" that Plato's student is supposed to bring with him when he confronts the mathematical projection of the metaphysical scheme. (Brumbaugh, 1954, p. 56)

Let us now turn to Proclus and his commentators to get a better grasp of the "key." First recall the reference by Aristotle in his *Nicomachean Ethics* 1095a30 to Plato's always rightfully asking, "are we on the way from or to the first principles?" I might add the question, "are we moving up the ontological and epistemological Divided Line, up out of the Cave of the *Republic*?" Or, on the other hand, "are we 'deductively' proceeding back down into the Cave of 'ordinary' visible experience, preparing for the 'quasi-experimentation' process (what Peirce refers to as induction)?" As to the upward abductive movement, we find Proclus in his "Eudemian Summary" indicating that:

certain methods have been handed down. The finest is the method which by means of analysis carries the thing sought up to an acknowledged principle, a method which Plato, as they say, communicated to Leodamas, and by which the latter, too, is said to have discovered many things in geometry. (Heath, 1956, vol. 1, p. 134)

The two basic movements, upwards, inwards or backwards to the One and downwards, outwards or forward into the Many, were clearly recognized by Proclus as central to Plato's combined epistemology/ontology. Thus Morrow, in the introduction to his translation of Proclus' *Commentary on the First Book of Euclid's Elements*, states:

...the cosmos of mathematical propositions exhibits a double process: one is a movement of "progression" (proodos), or going forth from a source; the other is a process of "reversion" (anodos) back to the origin of this going forth. Thus Proclus remarks that some mathematical procedures, such as division, demonstration, and synthesis, are concerned with explication or "unfolding" the simple into its inherent complexities, whereas others, like analysis and definition, aim at coordination and unifying these diverse factors into a new integration, by which they rejoin their original starting-point, carrying with them added content gained from their excursions into plurality and multiplicity. (Morrow, 1970, p.xxxviii)

Proclus not only preserved this Platonic sense of double movement, including its ontological relevance, but also its very intriguing epistemological sense. In particular, he captured the essential feature of analysis or abduction. And by doing so he is one of the few commentators to recognize the parallel with Plato's cryptic remarks in the *Republic*. But here again, to really begin to see this, we must turn to a commentator on Proclus who possesses a mathematical background. In our earlier quotation of Proclus by Sir Thomas Heath, where Proclus refers to "...the finest method...analysis...which Plato...communicated to Leodamos," Heath provides a very telling comment in a footnote:

Proclus' words about carrying up the thing sought to "an acknowledged principle" suggests that what he had in mind was the process described at the end of Book VI of the *Republic* by which the dialectician... uses hypotheses as stepping-stones up to a principle which is not hypothetical, and then is able to descend step by step verifying every one of the hypotheses by which he ascended. (Heath, 1956, vol. 1, p. 134, fn. 1)

Mueller, following in this Neopythagorean mathematical interpretation of Plato's epistemology, has set forth a view consistent with that espoused here of Plato's adaptation of

mathematical analysis to the general dialectical method of discovery:

Analysis can be thought of as the process of looking for the proof of an assertion P by searching for the propositions that imply P, until one reaches propositions already established....(Mueller, *Mathematical method, philosophical truth*, in Kraut, ed., 1992. p. 175)

Of course one must realize that it may not always be the case that one arrives at an independently established proposition, or for that matter, hypothesis. The tentative hypothesis thus derived may be shown to work out only through subsequent deductive predictions and observation (involving confirmation or disconfirmation) as is the case with our general scientific method. Likewise, the analysis may result in a lemma which requires further proof, or a diorismos which sets forth the necessary and sufficient conditions under which the truth of the proposition or hypothesis, or solution of the problem, may be established. Each of these specific features is nonetheless consistent with the overall generic method of abduction, apagoge, or analysis.

In addition to Proclus' overall recognition of the primary character of abduction or analysis, he also set forth some of the subcategories or specific applications of abduction, for example that of reduction:

Reduction is a transition from one problem or theorem to another, the solution or proof of which makes that which is propounded manifest also. For example, after the doubling of the cube had been investigated, they transformed the investigation into another upon which it follows, namely the finding of two means; and from that time forward they inquired how between two given straight lines two mean proportions could be discovered. (Heath, 1956, vol. 1, p. 135)

It is unfortunate that few philosophers of the modern or postmodern periods have penetrated into a real understanding of the quintessential technique employed by Plato. Very few philosophers have taken seriously the interpretive skills of Proclus as preserving inner truths of Plato. This is true also with the Platonic commentators. With very few exceptions (e.g., Thomas Taylor and Darcy Wentworth Thompson), unless one recognized the truly Pythagorean, and therefore esoteric approach of Plato, one was not

able to discover the inner wisdom of the King of Philosophers. It was left to the mathematician-logician/philosopher, Charles Sanders Peirce, to truly rediscover the essence and supremacy of Plato's dialectical method of discovery. Although familiar with many of the Neoplatonic writings, Peirce himself pinpoints the logical writings of Plato's student, Aristotle, as the source of his discovery.

Pierce states that he discovered Abduction in the logical writings of Plato's student Aristotle, in particular, in the latter's *Prior Analytics*. As Peirce states:

There are in science three fundamentally different kinds of reasoning, Deduction (called by Aristotle *synagoge* or *anagoge*), Induction (Aristotle's and Plato's *epagoge*) and Retrodution [abduction] (Aristotle's *apagoge*). (Peirce, *Collected Papers*, vol. 1, \*65, p.28)

Although most logicians are content to distinguish Deduction and Induction, it is to Peirce's credit that he recognized that the members of the Academy, Aristotle included, were really on to something unique. He understood what the Platonists (through their Neoplatonic interpreters, like Proclus) had been suggesting all along. Here we have a real creative and intuitive technique of discovery, what today we might suggest involves the nondominant right hemisphere. In fact, *it is the only inferential method that leads to new and original material*. Plato was not exaggerating when he maintained in the *Philebus* that:

It is indeed the instrument through which every discovery ever made in the sphere of the arts and sciences has been brought to light....[It] is a gift of the gods....(*Philebus* 16c)

Peirce in his brilliance recognized, that although the resulting hypothesis is tentative and conjectural, this was the one technique that provided something new and original:

Abduction is the process of forming an explanatory hypothesis. It is *the only logical operation which introduces any new ideas*.... (Peirce, 1931-1958, 5.171)

It should be noted here that it was to the credit of the Platonic commentator Cornford that he (Cornford) recognized the intuitive

leap involved in the process of Plato's dialectical ascent. Thus Cornford writes:

Plato realized that the mind must possess the power of taking a step or leap upwards from the conclusion to the premiss implied in it. The prior truth cannot, of course, be deduced or proved from the conclusion; it must be grasped (ἀψασθαι, Republic 511b) by an act of analytical penetration. Such an act is involved in the solution "by way of hypothesis" at *Meno* 85....The geometer directly perceives, without discursive, argument, that a prior condition must be satisfied if the desired construction is to follow. (Cornford, 1965, p.67)

Peirce recognized that this intuitive aspect of Abduction, with the corresponding leap in insight, was part and parcel of the actual scientific method. He saw that successful abduction depends upon creativity and an ability to see new relations and reason in new and novel ways. Thus, gradual progression,

... is not the way in which science mainly progresses. It advances by leaps; and the impulse for each leap is either some new observational resource, or some novel way of reasoning about the observations. Such novel way of reasoning might, perhaps, be considered as a new observational means, since it draws attention to relations between facts which would previously have been passed by unperceived. (Peirce in Buchler, ed., *The Scientific Attitude and Fallibilism*, 1955, p. 51)

Peirce had also recognized the successful use of Abduction by Johannes Kepler. Kepler is clearly one of the few who penetrated into the secret doctrine of Plato, both in terms of his ontology (c.g., the One, Indefinite Dyad, and the golden section) and epistemology (e.g., abduction). Peirce had recognized that the scientific method of reasoning may be viewed as a series of explanatory approximations to the observed facts. Our "abductively conjectured" hypotheses will often approximate to an explanation of the facts. One continues to attempt to retroduct a more complete hypothesis which does a better job of explanation. Thus, we see the unfolding of a series of abductively derived hypotheses. Each hypothesis presumably approximates more closely to an "adequate" explanation of the observed facts. Hence, observing Kepler's work in "De Motibus Stellae Martis," Peirce wrote:

At each stage of his long investigation, Kepler has a theory which is approximately true, since it approximately satisfies the observations...and he proceeds to modify this theory, after the most careful and judicious reflection, in such a way as to render it more rational or closer to the observed fact. (Peirce in Buchler, ed., *Abduction and Induction*, p. 155)

Furthermore, Peirce recognized in Kepler's application of Abduction that, even though there is an element of guess-work involved, it is in no sense capricious:

...never modifying his theory capriciously, but always with a sound and rational motive for just the modification he makes, it follows that when he finally reaches a modification—of most striking simplicity and rationality—which exactly satisfies the observations, it stands upon a totally different logical footing from what it would if it had been struck out at random. (*Ibid.* p. 155)

Thus Peirce recognized certain unique characteristics regarding Abduction that distinguished it from either the Inductive or Deductive methods of inference. Abduction clearly involves creative and intuitive, though not capricious, guesswork. In its generic sense, the goal of Abduction is to arrive at a satisfactory explanatory hypothesis. Peirce actually referred to it as the "operation of adopting an explanatory hypothesis" (Peirce in Buchler, ed., p. 151). It is always the originating process based upon the observation of anomalous phenomena (i.e., phenomena which do not fit in with the prevailing paradigm or accepted theory; what Peirce's friend William James referred to as "novel observations" or "wild facts"). Thus, Peirce referred to Abduction as theory. As such, Peirce referred to it as "...the first process, that of entertaining the question" (*Ibid.*, p. 151). And he recognized that what most distinguished it from the other methods of inference was that "it is the only logical operation which introduces any new ideas" (Peirce, 1931-1958, 5.171). But he also realized that the Abduction, to be justified, required subsequent verification through deductive predictions and inductive verification. As he stated, "...in pure abduction, it can never be justifiable to accept the hypothesis otherwise than as an interrogation" (Peirce in Buchler, p. 154). Thus, it is really the probational adoption of a hypothesis.

Peirce makes this clear when he examines more closely the work of Kepler:

at certain state of Kepler's *eternal exemplar of scientific* reasoning, he found that the observed longitudes of Mars, which he had long tried in vain to get fitted with an orbit, were (within the possible limits of error of the observations) such as they would be if Mars moved in an ellipse. The facts were thus, in so far, a likeness of those of motion in an elliptic orbit. Kepler did not conclude from this that the orbit really was an ellipse; but it did incline him to that idea so much as to decide him to undertake to ascertain whether virtual predictions about the latitudes and parallaxes based on this hypothesis would be verified or not. *This probational adoption of the hypothesis was an abduction. An Abduction is Ordinary in respect of being the only kind of argument which starts a new idea.* (Peirce in Buchler, ed., 1955, p. 156)

One of the most fascinating aspects of Peirce's rediscovery of Abduction, was his recognition that its form is similar in structure, though not identical, to a deductive fallacy, namely, the fallacy of affirming the consequent. Peirce set forth the "form" of abductive inference as follows:

The surprising fact, C, is observed; But if A were true, C would be a matter of course. Hence, there is *reason to suspect that A is true.* (*Ibid.*, p. 151)

Note that the inference is not that A is true, but rather, that we have reason to suspect the truth of A.

Finally, before leaving Peirce, it should be noted that not only did he discover the central role of Abduction in the discovery and explanation process, but he also explicated its relation to Deduction and Induction:

The Deductions which we base upon the hypothesis which has resulted from Abduction produce conditional predictions concerning our future experience. That is to say, we infer by Deduction that if the hypothesis be true, any future phenomena of certain descriptions must present such and such characters. We now institute a course of quasi-experimentation in order to bring these predictions to the test, and thus to form our final estimate of the value of the hypothesis, and this whole proceeding I term Induction. (Peirce, *Collected Works*, vol. VII, Footnote 27 to \*115, p. 67)

In conclusion, Plato developed the technique of discovery (Abduction) in the Academy as well as with the astute readers of his dialogues. Proclus carefully, but reservedly, perpetuated the tradition *for those few amongst us who have eyes to see and ears to hear*. And the genius of Charles Sanders Peirce grasped the supreme importance of the technique, making it a cornerstone, if not the foundation stone of his Pragmatism. In our own century, people like Albert Einstein and David Bohm continuously employed the method. Starting with anomalous phenomena, they were able to abduct hypotheses with tremendous explanatory power. Although it is true that this can be troubling to those stuck with their petrified paradigms. Relativity Theory was the abductive result of focussing upon (rather than ignoring) three problems anomalous to the prevailing paradigm of the time. As Thomas Kuhn has pointed out:

Einstein wrote that before he had any substitute for classical mechanics, he could see the interrelation between the known anomalies of black-body radiation, the photoelectric effect and specific heats. (Kuhn, 1970, p. 89)

This anomaly/ abduction procedure was also very true of David Bohm. From personal experience as a student of his at Birkbeck in the mid-seventies, I can attest to the basic process of abductive reasoning in his daily work. These intellectual giants followed upon the groundwork of Plato, Proclus and Peirce, in the process of focussing upon the anomaly (or anomalies) and abductively reasoning backwards (and upwards) to a novel explanation (and corresponding new paradigm). Focus upon anomalies, including the Einstein, Podolsky, Rosen experiment, helped stimulate David Bohm in his startling discoveries of ■ Universe rooted in nonlocality, analogous to a hologram, with an implicate as well as explicate order. We probably owe the most to the Philosopher King himself, Plato. However, we must not forget the careful, though enigmatic and veiled preservation by Proclus (and the Neoplatonic tradition), as well as, the incredible rediscovery made by Charles Sanders Peirce. Here we see the beauty of a foundational logical method cutting across Platonism, Neoplatonism, and Pragmatism.

My good friend, colleague, and mentor Huston Smith has the opening paper in this book, which he titles: "*Science and the Great*

*Chain of Being*." In this wonderfully challenging and insightful paper, Professor Smith states:

I do not think that we can get to the Great Chain of Being through science. (p. 4)

What I would contend here is that the essence of the scientific method of discovery, which I take to be Abduction, is truly applicable to the Great Chain of Being. For Plato and the Neoplatonists, Abduction carries us upwards to the 1st *Republic* within the Cave and Divided Line similes. This epistemological method is not at all inconsistent with ■ deeply metaphysical and in fact spiritual ontology. Where science per se has failed us in the past is when certain materialistic and reductionistic assumptions and presuppositions have been made. In those contexts, it has been mere scientism masquerading as science. But Abduction, the logic of discovery and the essence of the scientific method, is an epistemological method clearly applicable to the divine hierarchy of the Great Chain of Being. I fully contend that Plato was both serious and correct when he stated in the *Philebus* that:

It is indeed the instrument through which *every discovery ever made in the sphere of the arts and sciences* has been brought to light.... (Philebus 16c)

It is now time that "mainstream academia" recognize the supreme role of Abduction, and pay homage to Neoplatonism (predominantly through Proclus) and to Peirce for carefully preserving for us this great technique of discovery that had its birthplace and refinement in the hallowed halls of the first Academy.

# **Neoplatonism and the Cosmological Revolution: Holism, Fractal Geometry, and Mind-in-Nature**

**David Fideler**

## **I. From the Living Universe to the Mechanical Universe and Back Again**

In the Philosophies of ancient and traditional cultures, the universe was recognized as being all of one piece. Social and religious structures helped maintain the bond between individual, culture, and cosmos, and in traditional societies the universe itself was commonly seen as an organism, a living entity with whom they lived in mutual symbiosis. Plato described the cosmos as a "single Living Creature which encompasses all the living creatures that are within it,"<sup>1</sup> a canonical description quoted time and again by Plotinus.<sup>2</sup> In the body of the living universe, animated by the World Soul, all parts are interrelated through the power of sympathy and by the fact that the manifest cosmos is itself rooted in the Nous (Mind/Being), which is a dynamical system of unity-in-multiplicity.

Nothing could be further from the Neoplatonic vision of the living universe than the mechanistic cosmology of the Scientific Revolution, which emerged from the first great cosmological revolution of the Western world. God was portrayed as an engineer and lawmaker who set the atomistic, world-machine in motion. The universe was pictured as a giant clock, and all external reality was reduced to two fundamental principles: dead, unintelligent matter, and motion, the efficient cause that powered it. Galileo suggested that only the primary qualities of mass and motion were essential; secondary qualities like color and beauty, which could not be quantified, were irrelevant in scientific work and perhaps even unreal. Descartes explained that only humans possessed mind; our

bodies, animals, and the rest of the world functioned as mere machines. Francis Bacon formulated a philosophy of science in which the worlds of fact and value were sharply divorced, and in which science was seen as a means for the rational control and exploitation of nature.<sup>7</sup> Thus, at its birth, contemporary science was not simply a search for rational understanding as philosophy had claimed to be in earlier times. Science became a way of knowing based on prediction and control of the external world. The picture of God as an engineer was really nothing other than a image of the scientific ethos itself. This "divine engineer" possessed detached, calculating reason; power, prediction, and control over nature; and the godlike wisdom to structure reality in the best possible way. With the rise of capitalism and the explosion of industrial technology, the stage was set for the emergence of the contemporary world. Not only did the scientific worldview sanction the exploitation of nature, but with the rise of economic and factory structures, workers too came to be pictured as cogs in a vast economic machine. Technology, which promised human salvation in the new, millennialistic mythology of progress, also possessed an ambiguous, shadow side, for the very machinery that was supposed to liberate humanity from mundane concerns could itself become an instrument of bondage.

Over the last century the mechanistic view of the universe has started to completely break down. Because the implications of quantum mechanics, chaos theory, and the realization that we inhabit an evolutionary, self-organizing universe are starting to work themselves out, it is no exaggeration to say that we are truly living in the midst of a new Cosmological Revolution that will ultimately overshadow the Scientific Revolution of the Renaissance. And if the mechanistic world view left us stranded in Flatland—a two dimensional world of dead, atomistic matter in motion—the emerging cosmological picture is far more complex, multidimensional, and resonant with the traditional Neoplatonic metaphor of the living universe.

In the basic equations of classical physics, a complexity so great has been discovered that it renders simple natural systems unpredictable and "chaotic." Our awareness of the universe is returning to life with chance, spontaneity, and creativity. The

Newtonian model of the solar system as a deterministic, periodic system works quite well when the system consists of only two bodies—the sun and one planet—but as soon as other bodies are introduced, so too is a chaotic, nonlinear dimension.<sup>8</sup> Figure 1 illustrates the path of an imaginary dust particle orbiting between two equal gravitational centers; it exhibits a complexity so great that, beyond a certain point, it is impossible to predict the orbit of the dust particle with classical equations. Astrophysicists now realize that a similar complexity exists within the solar system, and highly chaotic behavior is exhibited by Hyperion, a moon of Saturn. As Hyperion tumbles through space its speed of rotation is in constant flux, exhibiting periods of order in an otherwise chaotic sea of behavior.<sup>9</sup> For the most part, regions of chaotic gravitational turbulence in the solar system are found to exist between the habitual pathways of the planetary orbits, but this is not entirely true; it is possible for planetary orbits to change, and chaotic variations in the Earth's own orbit account in part for the climatic changes associated with Ice Ages. Astrophysicists think that Pluto's orbit might some day change suddenly; and, while not as likely, it is possible that the Earth itself could shift into a new orbit. While somewhat unsettling to contemplate, the solar system is stable only in a statistical sort of way.<sup>10</sup>

If mechanistic science had painted a thoroughly deterministic picture of the world, it is now suggested that the indeterminacy of the quantum realm would be inevitably amplified through the sensitive dependence on initial conditions that underlies chaotic,

**Figure 1**  
Chaotic behavior exhibited by a dust particle orbiting two equal gravitational centers.

natural systems. Given two planets that were absolutely identical in every respect, it wouldn't be long before they started to exhibit uniquely different behavior in their weather patterns and so forth, thanks to the creative, indeterminate energy boiling up from the quantum level.<sup>7</sup>

By over-simplifying the world, classical physics contained the seeds of its own destruction. In a universe comprised solely of discrete bits of unintelligent matter in motion, it's hard to account for the self-organization of the cosmos and the fact that organisms behave as though they are more than the sum of their individual parts. But the real surprise came as physicists began their descent into the mystery of matter. Matter itself dematerialized and started to look more like dancing patterns of energy; according to the theory of General Relativity, matter and energy are entirely equivalent. Then, with the emergence of quantum physics, the whole apparatus of discrete, either-or categories on which traditional Western logic is based were shown to be inadequate. Paradoxically, light acts like a discrete particle *and* a non-discrete wave in one and the same phenomenon.<sup>8</sup> Recently in 1982, physicists proved by repeatable experiments that "particles" of light that originate from a common source continue to act in concert with one another as a whole system, regardless of how far apart they are—the type of "spooky action at a distance" that Einstein tried so hard to avoid.<sup>9</sup> The tantalizing implication of quantum nonlocality is that the entire universe, which is thought to have blazed forth from the first light of the big bang, is at its deepest level a seamless holistic system in which every "particle" is in "communication" with every other "particle," even though separated by millions of light years. In this sense, experimental science seems to be on the verge of validating the perception of all mystics—Plotinus included—that there is an underlying unity to the cosmos which transcends the boundaries of space and time.<sup>10</sup>

If the emblem of the mechanistic world view was the Cosmic Clock, the symbolic image which best reflects our current cosmological revolution is the Mandelbrot set, a specimen of fractal geometry which first entered public awareness in 1985 and has continued to ripple outward ever since.<sup>11</sup> Fractal geometry provides one of the most powerful cognitive tools available for deeply understanding the complex fabric of nature, and it is a subject that is intrinsically related to the Neoplatonic philosophy of Mind. As

we reflect upon the basic characteristics of fractal geometry and the Plotinian description of the Nous, the essential relationship between the two topics becomes immediately obvious.

We'll begin in familiar territory with the Plotinian description of the Nous and move on to fractal geometry.

## II. The Plotinian Description of the Nous

### 1. *The Nous Is a Living Harmony of Sameness and Difference, Unity and Multiplicity*

Aside from the One which exists beyond Being, the most abstract, universal concept is Being itself. But Being possesses two essential qualities: simultaneous Unity and Multiplicity or Sameness and Difference. In order for something to be, it must first be itself through self-identity or Sameness, and it must also be unique and distinct from everything else through the principle of Difference.

For Plotinus, universal Being is a living, harmonic synthesis of Sameness and Difference, Unity and Multiplicity, the Finite and the Infinite.<sup>12</sup> All of these analogous terms describe the same fundamental relationship, and in his thinking Plotinus is indebted to the Pythagorean and Platonic tradition. For the Pythagoreans, the *kosmos* is a *harmonia* of the Limited and the Indefinite, the perfect image of which is the musical scale: a harmonically differentiated image of Unity.<sup>13</sup> Plato likewise follows this tradition in the *Timaeus* when he describes the generation of the World Soul: The primordial constituent of reality is Being, and its two faces, Sameness and Difference. The demiurge weaves Sameness and Difference together through the mathematical ratios of music, and, the resulting harmonic entity is the World Soul, in which every part is sympathetically related to every other part through logos, proportion, and resonance.

### 2. *The Nous is Self-Recursive: Intellect-Being is Folded Back on Itself*

Another characteristic of the Plotinian Nous is that Intellect and Being is self-recursive or folded back upon itself. Plotinus characterizes the Transcendent Absolute as One, the Nous as a One-Many, and the World Soul as a One-and-Many. As a living

Unity multiplicity, the Nous is folded back upon itself in a circle. Plotinus insists repeatedly that the Nous is a thought that thinks itself. thinker, thought, and the object of thought are one; intellection and Being is a living vision in which subject and object are identical.<sup>14</sup> Reality is a self-recursive act rooted in the eternal.

3. *The Nous is a Holistic System in Which the Parts Contain the Whole and all the Parts are Interimmanent within One Another*

There is a total harmony and unity of existence. The manifest universe, rooted in the Nous, is a closely knit organism in which all of the parts are interrelated, for they are parts of a self-sympathetic living unity. The whole is articulated in the parts and the parts holographically reflect the nature of the whole.<sup>15</sup> Moreover, the parts are interimmanent<sup>16</sup> and reflected in one another; in the cosmic fellowship of the universal organism, the far is also near, and every part both receives from the All and gives to it.<sup>17</sup> From an epistemological perspective, knowledge is possible because all beings are rooted in Being and all intellects are rooted in Intellect. As Plotinus states, Mind is not something in us, but we are in Mind, and the very fact that you can understand these words is because we are rooted in a common matrix of Mind which exists between us.

### III. Fractal Geometry, Mind, and the Fabric of Nature

Like Plotinus's description of Mind, the most interesting type of fractal geometry—non-linear fractal geometry—emerges when a natural or mathematical process is folded back upon itself in a self-recursive loop. Because the existence of computer graphics makes the exploration of fractal geometry possible, the study of fractals is relatively young. But fractal geometry is already changing the way that we look at the world, because it has become obvious that most natural phenomena possess a fractal dimension. As we can see in Figure 2, one primary characteristic of fractal geometry is that it possesses self-similarity at different levels of scale. In this computer generated fractal of a maple leaf—and in actual maple leaves—we can see that the pattern of the entire leaf is organically replicated at ever smaller levels. Like the edges of a leaf, coastlines and mountain ranges are fractal and exhibit self-similarity at different levels of magnification. Each tiny leaf on a fern is a model of the branch on which it resides (Figure 3). each branch is a model of the entire fern (Figure 4). The same type of self-similarity is seen in many types of trees (Figure 5).

Figure 2. Fractal model of a maple leaf. (© Michael Barnsley, from *Fractals Everywhere* by Michael F. Barnsley, published by Academic Press, 1988, 1993).

Figure 3. Fractal model of a fern in two-dimensions.

Figure 4. Fractal model of a fern in three-dimensions. (© Michael Barnsley, from *Fractals Everywhere* by Michael F. Barnsley, published by Academic Press, 1988, 1993).

Figure 5. Fractal model of a branch. (© Michael Barnsley, from *Fractals Everywhere* by Michael F. Barnsley, published by Academic Press, 1988, 1993).

Figure 6. The Mandelbrot set.

As the mathematical study of fractal geometry progressed, it became obvious that the central patterns of fractal geometry—self-similarity, scaling, and feedback—are reflected most organic and inorganic phenomena. In the same way that we exist in Mind, and mind is not something exclusively “in” us, so too are fractals not exclusively “in” the computer: the fabric of the living universe is

itself fractal in nature. The fractals are not in the computer, but we are in the fractals.

It is possible to draw a much stronger analogy between the Neoplatonic philosophy of Mind and the nature of fractal geometry. For this we turn to the most famous example of fractal geometry, the so-called Mandelbrot set (Figure 6), which is an infinite, artificial fractal that reveals the life and activity of numbers on the complex plane. The Mandelbrot set, which can be explored on a home computer with easily available software, is described by a simple algorithm which harmonically weaves the principles of Stability and Change, Sameness and Difference, the Finite and the Infinite.

If we look at the equation which describes the Mandelbrot set, we can see how it harmonically unites Sameness and Difference (Figure 7). A fixed number provides the foundation of Finite Sameness and Stability, but a changing number contributes the principle of Infinite Difference and Change. Like Plotinus's description of the Nous, the equation is recursive and folds back on itself, and through the circular path of Sameness pulsates an ever-changing informational flow of Difference.

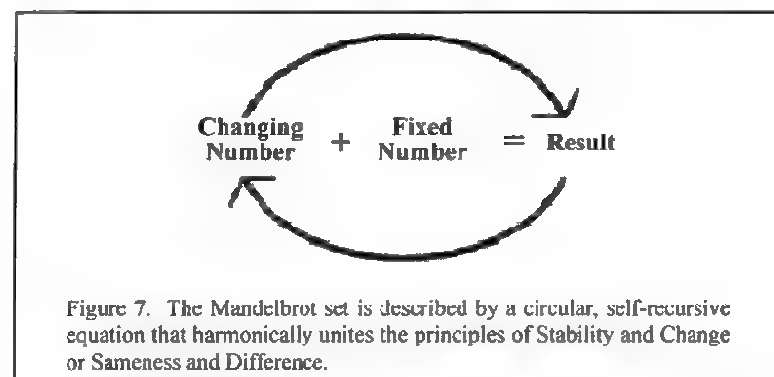

Figure 7. The Mandelbrot set is described by a circular, self-recursive equation that harmonically unites the principles of Stability and Change or Sameness and Difference.

When a computer plots the Mandelbrot set, it tests each individual computer pixel, which represents a fixed number on the complex plane, against the recursive algorithm to see how fast the number is changing. This is represented on the screen in various colors: stable numbers at rest are painted black, while numbers that are rushing off toward infinity are assigned different colors depending on their rate of change. From this simple equation, an entire graphic universe is brought into being.

Because the complex plane is infinite between any two points, it is possible to use a computer as a microscope to explore ever-finer details of the Mandelbrot set at ever-increasing magnifications. The most interesting and complex region appears at the boundary between stability and change. Zooming in along the edges, in different parts of the set we discover a host of organic forms reminiscent of the natural world: rivers, coastlines, flashes of lightning, crystals, leaves, and patterns that look like simple organisms. But the most amazing thing of all is that no matter how great the magnification is increased, the spaceship-like shape of the “mother set” continually reappears. This characteristic is shown in Figures 8A–8F, where the highlighted area is enlarged in the following illustration.

Using supercomputers which can magnify the scale billions of times, the haunting visage of the mother set continues to appear at ever-deeper levels like a mandala of tranquillity amidst a sea of change and becoming.

Like the universe now being envisioned by quantum physics, the self-recursive cosmos of the Mandelbrot set—and the cosmos of Plotinus—is a self-contained whole in which every part is related to every other part. And like the axiom of the Hermetic philosophers, “as above, so below,” the Mandelbrot set is holographic: a part contains the pattern of the entire whole—the macrocosm is perfectly reflected in the microcosm.

Figure 8 A-F. A short voyage into the infinite depths of the Mandelbrot set. Each successive illustration is an enlargement of the highlighted area in the previous illustration. Because the Mandelbrot set harmonizes the Finite with the Infinite in a self-recursive loop, it is infinitely complex but displays a holographic self-similarity at all levels of magnification. (David Fidler)

In summary, Plotinus's description of the *Nous* details how a marmonic union of the Finite with the Infinite, linked in an eternally self-recursive loop of self-reflection, gives birth to a holistic universe—a dynamical system in which the parts contain the whole and are interimmanent within one another. The Mandelbrot set clearly illustrates *all* these central characteristics of the Plotinian *Nous*, and gives us a clear idea of what it looks like to gaze into a self-recursive infinity of Sameness united with Difference. Yet beyond the infinite, there is also an elegant simplicity to all of this. Fractal geometry also shows how a simple, repetitive cycle of self-recursion can give birth to very complex structures of organic relatedness, a fact undoubtedly related to the genesis and development of organic life.

Finally, as Plato and the Pythagoreans symbolized the World Soul—the harmony of Sameness and Difference—by the musical scale, the Mandelbrot set offers an even better symbolic image of the World Soul because it shows in a graphic way how the harmony of Sameness and Difference gives birth to the organic relatedness of the natural world.

#### IV. Revisioning Neoplatonism: Life and Mind in an Evolutionary Universe

While the implications of fractal geometry and the existence of quantum nonlocality tend to support Plotinus's view of the seamless, holistic interconnectedness of the universe, the findings of contemporary cosmology also undermine several of his premises. Contemporary physics has demonstrated that all classical conceptions of matter are inadequate in the extreme, and if Plotinus was with us today he would surely revision his thinking in this area. Another problem occurs with Plotinus's assumption that the Earth and solar system have existed from eternity and always will,<sup>18</sup> which doesn't reconcile itself very well with our contemporary knowledge of the evolutionary universe. Platonists can still accept the premise that the universe and its beauty are rooted in eternal Being, and that beauty, contemplation, and creativity are gateways to the experience of timeless levels of reality. But the question remains: How does eternity get played out in the flow of time? And how do we bridge the gap between the eternal, noetic realm, and the evolutionary, self-organizing universe?

I believe that an answer might be found in Gregory Bateson's philosophy of Mind. Anthropologist, biologist, epistemologist, and

contributor to the theory of cybernetics, Gregory Bateson saw Mind as a metapattern, "a pattern that connects." Bateson described Mind in its simplest expression as "a circular or more complex system of parts in which information flows that makes a difference."<sup>19</sup> (Figure 9.) From this perspective, Mind is a self-recursive system, and processes like ecosystems can be said to possess Mind. Through varying combinations of negative and positive feedback within a system, minds can grind to a halt, be self-regulating, or spin wildly out of control on a runaway course. In healthy organisms, societies, and ecosystems, there is some type of self-regulating dynamic at work; otherwise, these types of minds would self-destruct or cease to exist. Assuming that such minds can pass on their characteristics through time, the evolutionary unfolding of further complexity becomes possible.

Figure 9. Gregory Bateson's definition of Mind.

As a biologist and a naturalist, Bateson never fully worked out all the philosophical, cosmological, and metaphysical implications of his conception of Mind, which, as he pointed out, is closely allied, if not identical, with the principle of Life.<sup>20</sup> But these considerations could provide a rewarding area for further exploration. The most unhappy and destructive bias of the modern world is the Cartesian notion that Mind exists only within humans, and that the rest of the world is inanimate, dead, and dumb. However, the epistemology of Plotinus and Bateson points

in an entirely different direction. Plotinus, after all, repeatedly affirmed that the entire universe is a single, living, intelligent organism.

Contemporary cosmology also suggests that the universe itself is teeming with life. Galaxies are now described as manifestations of self-recursive fractal geometry, and there are at least 100 billion galaxies, 20 billion of which can be photographed from Earth. Each galaxy contains on average some 100 billion stars and at least that many planets, a certain percentage of which must be inhabited by noetic, contemplative beings. Swimming like vast organisms in the endless sea of space, spiral galaxies appear as beautifully spun, moving, pulsating, evolving and mutating entities—celestial flowers or starfish—containing billions of individual cells. While Gregory Bateson never advanced the claim, galaxies are certainly "circular or more complex systems in which information flows that makes a difference," and thus are noetic, living systems by his definition. Moreover, if a galaxy is silently humming with the thoughts of beings who wonder about the meaning of existence, how can we assert that the galaxy itself is unconscious? Just as the skeletal system provides a foundation for more complex life processes but in itself does not think, galaxies, stars, and planets should not be hastily dismissed as dead and unintelligent when they are inhabited by intelligent life.

If we continue to investigate Gregory Bateson's definition of Mind and travel in a thought experiment back to the initial conditions of the physical universe, the universe itself could be said to possess a noetic dimension as soon as the fundamental forces of creation were linked together in a circular, mutually-transformative process, which must have been at an unimaginably primordial date. From this perspective, the entire universe can be seen as a circular noetic event progressively unfolding itself in time—"a thought that is thinking itself," to use the terminology of Plotinus. The advantage of this model is that it successfully reconciles the Platonic and process schools of philosophy which are not contradictory, in my opinion, but complementary. On the one hand, all of reality is rooted in the archetypal foundation of eternal Being, but on the other hand there is a genuinely creative evolutionary unfolding of manifestation, which can itself be pictured as a forward moving noetic event of increasing complexity. Time is thus revealed as "the moving image of eternity,"<sup>21</sup> to quote Plato—a moving image that is not closed, but creative and open-ended. The implication of this view is that the entire universe is noetic, dialectical, and evolutionary in nature; it is also teleological in the sense that it leans very heavily in certain directions. But by the same token,

there is creative freedom, for no one specific manifest phenomenon is absolutely predetermined in advance. In this sense, reality is both process and Being, an ongoing dialectic between time and eternity, between creative freedom and the confines of Form and universal Necessity. From this perspective, Bateson's view of Mind may be the needed missing link that can unite the Platonists with the process philosophers, the ontologists with the evolutionists, and the philosophers with the cosmologists.

Now that the mechanistic world view is breaking down, we need a new language, science, epistemology, and ontology that reflects our holistic relation with the living universe more accurately than does the language of classical science. In this sense, the epistemology of Plotinus and Bateson points in a direction that can help us move beyond the subject-object impasse of Cartesian dualism. Physicist John Wheeler's concept of the participatory universe also points in a similar direction. In a charming illustration, Wheeler describes the universe—the big "U" in Figure 10—as "a self-excited circuit" that is looking back at itself.<sup>22</sup> Starting with the primordial Flaring Forth,<sup>23</sup> over billions of years the universe expands, cools, and evolves, only to look back at itself in a moment of contemplative self-reflection. Humanity's so-called "dialogue with Nature" is actually the universe's dialogue with itself. In this regard, Plotinus offers some valuable advice:

All that one sees as a spectacle is still external; one must bring the vision within and see no longer in that mode of separation but as we know ourselves; thus a man filled with a god—possessed by Apollo or one of the Muses—need no longer look outside for his vision of the divine being; it is but finding the strength to see divinity within.

Figure 10. Physicist John Wheeler's concept of the participatory universe.

Plotinus, Bateson, and Wheeler each suggest that the psyche is not distinct from the cosmos, but the Mind of the living universe in search of its own nature. In this sense, none of us are detached, isolated observers, but we all belong to a community of beings which is itself a reflection of the entire universe. Because a world view colors every aspect of human experience, in the aftermath of the Scientific Revolution the focus of life became more one dimensional and utilitarian as individuals came to be seen as passive, mechanical cogs in systems of social and economic control. In the aftermath of the Cosmological Revolution, the focus of life will become more multidimensional, contemplative, and celebratory as we as individuals come to see ourselves as living embodiments of the-universe-in-search-of-its-own-Being, and as active participants in the ongoing creation of the world.

#### NOTES

1. Plato, *Timaeus* 30D3-31A1.
2. See for example Plotinus, *Enneads* 3.2.6, 3.2.7, 4.4.11, 4.4.32, 5.9.9.
3. On the mechanization of the world order in the Scientific Revolution, see Carolyn Merchant, *The Death of Nature*; Morris Berman, *The Reenchantment of the World*; and Rupert Sheldrake, *The Rebirth of Nature*.
4. This unpredictable complexity was first discovered by Henri Poincaré in his work *On the Problem of Three Bodies and the Equations of Dynamics* (1890). For discussion see Ian Stewart, *Does God Play Dice?*, chapter 4, and the sources cited in note 6.
5. Stewart, *Does God Play Dice?*, chapter 12.
6. For further discussions of chaos in the solar system see Ralph Abraham, *Chaos, Gaia, Eros*, chapters 15-17, and John Briggs, *Fractals: Patterns of Chaos*, 50-54.

7. Some forms of "chaos" are completely deterministic but unpredictable. Other forms, like the "quantum chaos" described here, are indeterminate. For a lucid discussion of the implications of chaos theory in relation to the different concepts of determinism, see Stephen H. Kellert, *In the Wake of Chaos*, chapter 3.
8. This is proven by the famous two slit experiment in quantum physics. For discussion see John Gribbin, *In Search of Schrödinger's Cat*, 163-171; Paul Davies and John Gribbin, *The Matter Myth*, 209ff.
9. On the experimental verification of nonlocality see Fritjof Capra, *The Turning Point*, 82-85; John Gribbin, *In Search of Schrödinger's Cat*, 216-231; Paul Davies, *The Cosmic Blueprint*, 176-177.
10. For a fascinating though sometimes technical discussion of the implications of quantum nonlocality, see Menas Kafatos and Robert Nadeau, *The Conscious Universe: Part and Whole in Modern Physical Theory*.
11. The Mandelbrot set was discovered by mathematician Benoit Mandelbrot and first seen in 1980 on a computer screen at Harvard University. This mathematical object first entered widespread public awareness in 1985 when it was featured in a *Scientific American* cover story. One fractal enthusiast suggests that "It could be thought of as a particularly insidious computer virus in that it not only takes over computers (very computationally intensive) but also the minds of programmers with its fascination."
12. This is encapsulated in Plotinus's Pythagorean-Platonic doctrine that the Nous is a harmonic union of the Monad (Form) and the Indefinite Dyad (the infinite "Intelligible Matter" of the noetic realm).

## Some Reflections on the Neoplatonic View of Space And Time

Robert Meredith Helm

On a summer's day in early childhood, I asked my mother a question that had been troubling my infant mind.

"What was there before the world was made?"

"Only God," she replied.

"Who made God?" I persisted.

"He was never made," she said. "He always has been."

I repaired to the porch swing, my favorite spot for contemplation, and tried very hard to think "forever and ever backwards." The idea of an eternal future had been hard enough for me to swallow when it had been brought to my attention by the language of the Church, but for some reason it had not assailed me with the sort of cosmic terror that I now felt at being confronted with the bottomless abyss of an infinite past.

I was tempted to dismiss the whole notion of a reality without beginning or end as impossible, but to my dismay I discovered that the alternative was equally inconceivable. Any possible beginning or end would have to have something before or after it. It did not take me long to see that what was true of the problem of time was equally true of space. To think of it as infinite was to show that it must be finite. To think of it as finite was to show that it must be infinite.

It was only many years later that I realized that on that day I had become a fledgling philosopher by grappling with a question which, far from being original with me, had for two and a half millennia been driving some of the greatest thinkers into paradox.

I say "for two and a half millennia." Actually the problem may be a much older one, especially in the East, but there is little evidence to show that it was formally recognized by Western thinkers until the birth of Greek philosophy in the sixth century

before the common era, when Anaximander, perhaps without full realization of the Pandora's box he was opening, made the *apeiron*, the indefinite or infinite, the physis at the heart of reality. We do not have enough fragments of his writings to know whether or not he gave any serious consideration of the problems to be encountered in a consideration of an infinitely extended spatial continuum or a time without beginning or end, and it seems likely that the term *apeiron* refers primarily to the indefinite or formless character of the primal reality.

We must look to Parmenides and Zeno of Elea for the first clear recognition in Greek philosophy of the paradoxes of space and time that were later to lead their successors to question whether ultimate reality can indeed be spatial and temporal. In defining Being as a finite whole, bounded neither by something else, which by pure logic could not exist, nor by non-being, which by definition cannot be, Parmenides took his logic beyond the categories of plurality and motion and invited the inevitable question as to whether space and time can exist anywhere but in the illusory world of "seeming." He himself must have seen his somewhat clumsy attempt to describe pure Being in physical terms as having become mired in paradox, for he appears to have laid the groundwork for a sort of philosophical idealism when he wrote:

Thinking and the object of thought are the same. For you will not find thought apart from being, nor either of them apart from utterance. Indeed, there is not anything at all apart from being, because Fate has bound it together so as to be whole and immovable. Accordingly, all the usual notions that mortals accept and rely on as if true—coming-to-be and perishing, being and not-being, change of place and variegated shades of color—these are nothing more than names. (Diels Fragment 8: 34-41. Wheelwright 98)

The *reductiones ad absurdum* by which Zeno essayed to demonstrate the impossibility of motion were equally destructive of time, the matrix in which motion occurs. As for space, we have this tantalizing fragment: "If place existed, it would have to be in something, i.e. in a place" (Diels Fragment 4).

It is difficult to determine what Melissus, the third of the Eleatics, thought of space and time. In the surviving fragments of

his writings, he argued for infinite as opposed to finite being and seems to have treated it as physical. According to Aristotle, "It seems that whereas Parmenides conceived of the One by definition, Melissus conceived of it in terms of matter" (*Metaphysica* 986b 19. Wheelwright 118).

Heraclitus, who took time and change as seriously as any philosopher in history, nevertheless was the first of the Greek thinkers to recognize by name the *Logos*, later to play an important role in theories positing a non-temporal and non-spatial ground of reality. "It is wise," he wrote, "to hearken not to me, but to the *Logos*, and to confess that all things are one" (Diels Fragment 50. Bakewell 31). There is no indication in the surviving fragments of his writings as to whether or not he thought of the *Logos* as beyond time and space, and the single cryptic reference he is known to have made to either of those categories by name does little to clarify their ontological status. "Time is like a child playing at draughts," he said. "The kingdom is a child's" (Diels Fragment 52. Bakewell 31). It is, however, significant that Plotinus referred to Heraclitus as one who, "with his sense of bodily forms as things of ceaseless process and passage, knows the One as eternal and intellectual" (*Enneads* 5.1.9. McKenna 377).

The Atomists, with a fine disregard for the logical difficulties posed by the assumption that space and time are primary features of the real world, theorized that "what is not," that is to say, empty space, is just as real as "what is," i.e. the atoms. Space, though non-being, is infinite and has at least one quality, infinite extension. Its infinity and the numerical infinity of the indestructible atoms that forever move in it in a real time seem not to have daunted Leucippus, Democritus, or their later followers, Epicurus and Lucretius.

Plato, patron sage of the later Neoplatonic movement, obviously was concerned about the problems of space and time and far better attuned to the Eleatics than to the Atomists. He was also strongly influenced by the Pythagoreans, who, in turn, had obviously been inspired in no small measure by ideas filtered into the Hellenic world from the East. The universe, Pythagoras and his followers had said, is generated from number, and the beginning of number is the monad. The resultant mathematically

conceived system was to play an important part in the development of Plato's metaphysics.

The Good, or the One, is clearly spaceless and timeless, as are the *Archai*. The relation of the *Mathematica* to time and space, however, is not without ambiguity, especially in the case of geometricals and possibly some ideas such as those related to the forms governing melody, which by their very nature would seem to necessitate some notion of temporal sequence. It can at least be said that for Plato, what is ultimately real is itself neither extended in space nor subject to change.

The world, on the other hand, is a creation and had a beginning. The "father and maker of all this universe" (*Timaeus*. Jowett 13) designed his creation in imitation of the unchangeable and eternal. "And having been created in this way," Plato said, "the world has been framed in the likeness of that which is apprehended by reason and mind and is unchangeable, and must therefore of necessity, if this is admitted, be a copy of something" (*Timaeus* 29. Jowett 13). When the same words are used about the world and the eternal reality of which it is, in some sense, a copy, they are employed neither univocally nor equivocally, but analogically (*Timaeus* 29. Jowett 13).

The eternal kind of being known to the intellect is clearly not extended in space, but it in some way provides the archetype for a world that is spatial and, after its own fashion, eternal and indestructible. This copy is the repository of created things known to the senses. Space itself "is apprehended without the help of sense, by a kind of spurious reason, and is hardly real" (*Timaeus* 52. Jowett 32). We experience it "as in a dream" (*Timaeus* 52. Jowett 32), recognizing that anything that has existence must have location and occupy space but that space itself cannot, therefore, exist.

Of these and other things of the same kind, relating to the true and waking reality of nature, we have only this dream-like sense, and we are unable to cast off sleep and determine the truth about them. (*Timaeus* 52. Jowett 32)

As for time, it came into existence in some fashion with the creation of the material world. Plato—or Timeaus in the work of that name—tells us that the Creator, in his joy at having succeeded in creating an image so like the original, decided to

improve the likeness by making the created universe eternal in so far as that might be possible. The everlastingness of "the ideal being" could not be realized in the created world, and so the Demiurge had to settle for a lesser degree of reality.

Wherefore he resolved to have a moving image of eternity, and when he set in order the heaven, he made the image eternal but moving according to number, while eternity itself rests in unity; and this image we call time. For there were no days and nights and months and years before the heaven was created, but when he constructed the heaven he created them also. They are all parts of time, and the past and future are created species of time, which we unconsciously but wrongly transfer to the eternal essence for we say that he "was," he "is," he "will be," but the truth is that "is" alone is properly attributed to him, and that "was" and "will be" are only to be spoken of becoming in time, for they are motions, but that which is immovably the same cannot become older or younger by time, nor ever did or has become, or hereafter will be, older or younger, nor is subject at all to any of those states which affect moving and sensible things and of which generation is the cause. These are the forms of time, which imitates eternity and revolves according to a law of number. Moreover, when we say that what has become is become and what becomes is becoming and that what will become is about to become and that the non-existent is non-existent—all these are inaccurate modes of expression. (*Timaeus* 38-39. Jowett 19)

Although Aristotle wrote a good deal about space and time, he dealt with those categories, for the most part, as they exist in experience of the physical world rather than with their relation to eternity. His influence on the Neoplatonists appears to have been primarily in areas where he was most nearly in agreement with Plato.

The Stoics were more concerned with Heraclitian flux than with speculation about a reality transcending space and time. "Time," Marcus Aurelius wrote, "is like a river made up of events that happen, and a violent stream; for as soon as a thing has been seen, it is carried away, and another one comes in its place, and this will be carried away too" (Marcus Aurelius IV 43. Long 72). Stoic influence on the Neoplatonic conception of space and time was, accordingly, somewhat limited. In general, Plotinus's views on the subject were a derivation of Plato's, adapted to fit in with

his own version of the three levels of reality responsible for the generation of the world of the senses: the One, Intellect (*Nous*), and Soul (*Psyche*).

The One, Plotinus held, must be because the idea of plurality without that of unity is as inconceivable as the idea of imperfection apart from that of perfection. The One, however, is not merely a numerical abstraction. It is the ultimate source of the distinction between unity and plurality and thus, in some way, the ground of spatial and temporal distinctions. Progress toward reality must proceed from lower to higher unities, and so the ultimate goal must be a reality transcending all differentiation and therefore beyond space and time.

Having said that much about the One, together with the ascription to it of a variety of other predicates entailing paradox, Plotinus nevertheless maintained that its real nature is unknown. It cannot properly be said even to be existent, and all meaningful propositions are based on the making of distinctions about existent categories. The best approach we can make to it by reason alone is by the denial of attributes. Only through mystical intuition, attained in an ascent to the highest level of awareness, can the soul gain a direct revelation of the source of its being.

Creation by the One is not *ex nihilo*. It is, rather the process of emanation or *perilampusis*, involving a going out and a returning of its own substance. As the One, the ultimate reality is first cause; as the Good, it is the final cause of everything.

The One is the totality of being. Its emanation of the world is a projection of itself into nothingness, with progressive diminution of the degree of reality that can be claimed by any particular feature of existence, until on the outer edges, metaphorically speaking, there is scarcely any reality at all.

The first emanation from the One, *Nous*—Divine Mind, the Intellectual-Principle, the Intellect, or Spirit—is the highest category of reality accessible to human thought. In it, there is awareness of differentiation, but the Intellect sees subjects and objects as diffusions of the higher unity. *Noesis* is the activity of *Nous*, and the *Noeta*, the Platonic archetypes, sharing a common origin with *Nous* in the One, are, in a sense, identical with *Nous*.

The world of *Nous* is not extended in space, nor is it in the stream of time. Those categories have their origin in the next stage of the process of emanation, that of Soul (*Psyche*), the

creator of the world of the senses. Space and time are necessary conditions of the distinction between subjects and objects, the plurality of objects in the everyday world, and the succession of events. *Psyche* partakes of the dichotomy of the One and the Many. As the World Soul, it retains its unity, reflecting the oneness of *Nous*, from which it proceeds. As differentiated into individual souls, its consciousness is fragmented.

Soul generates the physical universe, which operates under laws imposed upon it by the higher levels of reality. It is in this stage of the process of emanation that space and time come into their own, as individual souls become incarnate in particular bodies, through which they relate themselves to the world of things. Those things cannot, in turn, look downward or outward and continue the creative process, for they exist on the outer fringes of reality, beyond which is nothing but the darkness of non-being, and therefore, no space or time.

Objects, properly speaking, are not "material" in the popular sense. They are projections of soul. For Plotinus, as for Aristotle, "matter" is a relative term, in that the same aspect of the world may be form with reference to that which is below it and matter with respect to what is above it. At the lowest level, then, it can have nothing at all below it. It is whatever would remain if one began with any object and stripped away all its predicates. Such a process would leave one with no ponderable and extended stuff, but only with a bare abstraction. Matter is the *apeiron* of Anaximander, insofar as that term suggests the indeterminate. It is "bodiless—for body is a later production, a compound made by matter in conjunction with some other entity" (*Enneads* III. 6. 7. MacKenna 209). It rightly should be called Not-being rather than Being. It is "the image and phantasm of Mass, a bare aspiration towards substantial existence" (*Enneads* III. 6. 7. MacKenna 209). So powerless is it that if the forms imposed on it by Soul did not exist, it would not exist at all. Where the activity of Soul ends, then, we have the outer limits of Being. Between the *Noeta* of *Nous* and the Not-being of formless matter, space and time have their domain. "Matter and even body," however, "precede place and space" (*Enneads* II. 4. 2. MacKenna 113).

Later Neoplatonists modified Plotinus' system in ways that point up the difficulties involved in establishing the precise point

in the process of emanation at which space and time have their origin. Iamblichus especially, in introducing into Neoplatonism a more complex hierarchy of hypostases than Plotinus had thought necessary, injected between the intelligible world of ideas and the soul world an "intellectual" world of thinking subjects for whom time is real in a way analogous to, though not identical with, the lesser moving reality it has in the wholly dynamic soul world. There is, in other words, a higher time in the intellectual world and a lower one that manifests itself in the soul world as well as on an even lower level that Iamblichus called the "sensible" world (Sambursky and Pines 13). The constant motion of objects of sense touches the higher time of the intellectual world only at a "now" that is a point without magnitude so far as the senses are concerned, dividing a past that is gone from a future that is not yet. Iamblichus suggested that these events exist statically in the higher time of the intellectual world, where "earlier" and "later" have meaning, even if "past" and "future" do not.

"For," Simplicius quotes him as saying, "it would be impossible to reckon actions as earlier and later, had time not existed by itself, to which one has to refer the order of actions" (*Phys.* Sambursky and Pines 41).

For Iamblichus, however, as for the other Neoplatonists who, in greater or lesser degree introduced changes in Plotinus' system, the central thesis of the Neoplatonic view of space and time remained intact. They do not exist as predicates of ultimate reality but have their origin somewhere down the scale in the process of perilampsis. Their lesser reality is affirmed by every member of the school as well as by those Western thinkers from Augustine to Inge who have patterned their ontology and metaphysics along Neoplatonic lines.

During the time that Platonic and Neoplatonic themes were dominant in Western Scholastic philosophy the sharp dichotomy between the temporal and the eternal aroused little controversy. With the rediscovery of Aristotle in Europe in the twelfth century, the more empirical Peripatetic view of space and time received increasing attention and, during the Renaissance, European science and philosophy drifted farther and farther away from the Neoplatonic view.

It is interesting to note the way in which the arts reflected the changing attitudes toward the temporal and the eternal. In early

Christian painting and sculpture in Byzantium and Western Europe, the Virgin and the Christ Child are hieratic figures, stiffly enthroned in static architectural forms, where the passage of time has little or no relevance. In Renaissance art, the Virgin has become a supple young woman, arrested in some act of attending to her infant son, and the child is a real, live, wriggling little boy, frozen in a childish posture at a particular instant in time. As for the backgrounds, they are as often pastoral as architectural, suggesting the growing concern with process in the natural world.

With the resurgence of science too, scholarly attention turned toward the notion of space and time as absolute matrices in which objects exist and move according to mathematically formulable laws. This view of reality reached its zenith in the early modern period in the work of Isaac Newton, whose theories of space and time dominated Western science from the eighteenth century until the beginning of the twentieth.

Space, time, and motion, Newton maintained, have an absolute existence beyond any of the processes of observation and measurement by which their "relative" properties may be defined. "Absolute space, in its own nature, without relation to any thing external, remains always similar and immovable," he wrote. Relative space, defined by the senses, he held to be mutable (*Mathematical Principles*. Thorpe 12). Similarly, "Absolute, true, and mathematical time, in itself, and from its own nature, flows equally, without relation to any thing external; and by another name is called Duration" (*Mathematical Principles*. Thorpe 12). Measurement of discrete units such as hours, months, and years is a relative matter.

Absolute motion he defined as "the translation of a body from absolute place to absolute place" and relative motion as "the translation from relative place to relative place" (*Mathematical Principles*. Thorpe 13).

From the beginning, Newton must have realized that all the data that the senses can provide, as well as his own laws of gravitation, have to do only with relative motion. The concepts of absolute space and time can be justified, he admitted, only as presuppositions of certain properties of motion that can be experimentally verifiable. A belief in uniform, homogeneous, and infinite space and time was, however, of the utmost importance to him, perhaps not so much for its scientific significance as for the

way it fitted in with his philosophical and religious convictions. In the *General Scholium* added to the second edition of the *Principia*, he wrote:

...from his true dominion it follows that the true God is a living, intelligent, and powerful being; and from his other perfections that he is supreme, or most perfect. He is eternal and infinite, omnipotent and omniscient; that is, his duration reaches from eternity to eternity; his presence from infinity to infinity; he governs all things and knows all things that are or can be done. He is not eternity or infinity but eternal and infinite. He endures forever, and is everywhere present; and by existing always and everywhere, he constitutes duration and space. (Beck 19)

In the *Opticks*, Newton advanced the further suggestion that infinite space is the sensorium of God, who, "being in all Places is more able by his Will to move the Bodies within his boundless uniform Sensorium, and thereby to form and reform the Parts of the Universe, than we are by our Will to move the Parts of our own Bodies" (403).

Newton was no pantheist. The world is not the body of God, and he is not composed of the objects and events that occupy space and time. He is, however, ubiquitous and eternal, and the spatio-temporal frame of reference that determines absolute motion exists in his consciousness. Although Newton advised caution in ascribing attributes to God, his position must be regarded as at odds with that of the Neoplatonists in that it appears to make space and time primordial attributes of ultimate reality. Later writers uprooted the intricate structure of the Newtonian cosmos from the soil of the theistic world view from which it grew. Dispensing with God, they saw the infinite, mathematically describable continuum as the setting for a "world-machine" in which bodies move according to inexorable mechanical law without reference to any spiritual source.

Deprived of the philosophical and theological support that Newton's philosophy provided, it was, perhaps, inevitable that open attacks on the concepts of absolute space and time would draw open attacks from critics like Bishop Berkeley and Immanuel Kant, who were unwilling to acknowledge the existence of space and time apart from thinking subjects. Scientists, however, found the clockwork precision that the Newtonian

framework provided convenient for their work, and it remained dominant in Western cosmology until the failure of the Michelson-Morley experiments to detect any absolute motion of the earth provided an empirical ground for Einstein's special and general theories of relativity, which dispensed with absolute space and time altogether.

Later work by Hubble, Friedmann, Hawking, and other investigators of the phenomena that suggest an expanding universe have led to widespread acceptance of the "big-bang" theory, according to which the universe did not begin its expansion into a pre-existing continuum but created space and time in the primal explosion that initiated the expansion.

And so, after seventeen centuries, the main body of Western cosmological speculation has turned back to a world view with which the early Neoplatonists might feel quite at home. Even before "big bang" became a household term, Dean Inge, who called himself "a disciple of Plotinus," was maintaining in his *God and the Astronomers* that the developments of early twentieth-century science were compatible with a Neoplatonic view of reality.

Neoplatonists and other theorists baffled by the inevitable paradoxes that result from the attribution of spatial extension and temporal duration to primal reality, have suggested a realm transcending both space and time. In their appeal to reason in support of their systems, they have arrived at conclusions that produce as many difficulties as the sort of naive realism that they reject as contrary to reason.

One obvious problem arises in their attempt to explain precisely what is meant by their assertion that Soul and the space and time generated by it are "less real" than the Intellect or the One.

In everyday usage, "real" is used to differentiate a genuine member of some definable class from something that has some but not all of the definitive characteristics of objects belonging to that class.

When a victim of alcoholic psychosis is told that his pink elephant is not "real," his informant usually means no more than that the object in question is not one that can be subjected to public examination and pass muster as a genuine *Elephas Maximus* or *Loxodonta Africana*. It is, however, a real

hallucinated elephant—that is, an object having four legs, a trunk, fan-like ears, and a variety of other perceived elephantine qualities, even though it may lack extension in public space. If it is true that the imagined pachyderm is not publicly perceived, it is equally the case that if a publicly perceived elephant should wander into the field of vision of our alcoholic friend, it might be a disastrous error to treat him as a real hallucinated elephant.

In this popular usage, the expression “degrees of reality” is unintelligible. But the popular usage clearly does not carry the meaning—or at least not the whole meaning—that the Neoplatonists assign to the term “real.” To say that something is “more real” than something else is apparently to ascribe to the former a higher status in a metaphysical hierarchy or to say that it has a higher value. In either case, it assumes an archetypal status as related to something which, “imitating” it in some ways, is nevertheless of lower metaphysical rank or lesser value.

So, the relationships that make possible a plurality of objects in space in the world of the senses must be imitative of some properties in the intelligible world. In the case of numericals, I may possibly be able to think of one number’s being related to another without reference to any clearly spatial separation, but the case is considerably less clear for geometricals. The very essence of any conceived class of triangles or circles, and perhaps even of triangularity and circularity themselves, is of necessity defined in spatial terms, and so, if the archetypes designated by the terms do not possess extension in the sort of space apprehended by the senses, we are nevertheless impelled to posit an analogous “space” understood by the intellect.

The fact of the matter is that if it is virtually impossible to imagine a limited spatial continuum without thinking of it as contained within another space, it is equally difficult to think of the totality of space, finite or infinite in extent, as being somehow “contained” in something else without thinking of that container as another “space” of some sort. Human imagination is so ordered that to try to picture spacelessness is to fall almost inevitably into the trap of conceiving of it as an unextended point in space.

The same would seem to be true of time. I may be able to frame a denial of the existence of referents for “past” and “future” in the world of the Intellect, but I find it much more difficult to

get rid of “before” and “after” if I am to assume that there is any sense in which events in the world of the senses have their ground in the ideas or forms apprehended by the Intellect.

Let us consider three events, all of them occurring in the city of Rome. In December of the year 100 B.C., one Marcus Antonius, was named consul for the coming year. In December of the year 800 A.D., Charlemagne was crowned as Emperor. In December of the year 2000 A.D. it is entirely possible that some other individual will assume some other office at a spot quite near those on which the other events occurred. Now from our standpoint, the greater distances between these events are not spatial but temporal in nature. Moreover, there is a radical distinction between the two sorts of measurement. I can traverse the spatial distance that separates any two of the three locations in either direction and could conceive of doing so even if they were much more widely separated, but the temporal distance is quite another matter. Two are in different regions of the past and one in a problematical future. In the world of the senses, I might bridge the temporal gap that separates them only if I had a life span of more than two millennia and could be present at all three in proper sequential order. The third event, from my present standpoint, has this further difference from the other two. It has not yet occurred and can be productive only of propositions having that sort of ambiguous truth values that Aristotle could attribute to his sea battle.

Unlike the spatial axes defining the relationships between one event and another, the temporal axis does not permit me to travel freely from one to the other. I must look back on past events and forward to future ones. Only the present is immediately accessible to me, and I cannot, by any act of will, move to another time as—given the proper circumstances—I can move to another place.

But what of the present? Is it something without temporal magnitude, separating a past that has ceased to exist from a future which as yet has no existence? To define it in that way would seem to lead to a sort of nihilism that would prohibit my saying that anything can exist at all, in view of the fact that at any present, it lacks one essential dimension—that of duration—and must thus lose all its solidity and become a mere mathematical abstraction like a plane or a line or a point. Attempts to evade

this conclusion, however, by positing some sort of extended present like Bergson's *durée*, would seem to involve the inclusion in that present of a little bit of past and a little bit of future.

How much? And why just a little bit? Why not the whole of the past and the whole of the future, whether those wholes be finite or infinite? It is, I think, just this sort of question that led to the spatialization of time that seems to be entailed in Neoplatonism and that has come to have a widespread appeal among twentieth-century cosmologists. I can evade the problem by taking refuge in a sort of "eternal now" known to the Intellect.

But can I? If the Intellect is in any sense the model for the Soul World, it must, even if it provides some perspective from which all events can be regarded as in some sense "present," still regard Marcus Antonius's election as "before" Charlemagne's coronation, and the installation of our official in Rome in the year 2000 as "after" both of the other events. If this is denied, these events cannot simply be relegated to a "lesser" reality. They can have no reality at all.

I am, of course, in a situation somewhat analogous to that of an eternal or pan-temporal observer in my relation to a written narrative or one recorded on film, tape, or disc. All the "spaces" and "times" in the work are in a different universe of perception from the one in which I live my everyday life, and all are, in a sense, "eternally" present for me by virtue of being simultaneously present in my broader universe. In *Macbeth*, the encounter with the witches, the murder of Duncan, and the movement of Birnam Wood to Dunsinane are, at any instant of my time, all present in the play or in any filmed or taped performance of it, and I can contemplate them in any order I choose, or even—somewhat fuzzily, to be sure—think of them simultaneously. But, if I am familiar with the whole play, I can never be unaware of the fact that in the universe of the drama they occur in different places and succeed one another in different times. Moreover, each event owes a major part of its character to the causal relationships that bind them together. It is presumably considerations of this sort that led Iamblichus to conclude that the spatio-temporal relations experienced in the Soul World have a corresponding ground in the Intellect, if not in the One itself.

Of course, my analogy, like all analogies, is inexact. My attention is so limited that it "takes time"—my time, that is—for

me to examine the events of the drama in any order. An omniscient observer, not subject to my limitations might be able to take in the whole of the cosmic order and its history in a single act and thus live ubiquitously in an "eternal now." He would not, then, remember the past or foresee the future. Rather, he would know every event as a present reality. But can we really think of that sort of knowledge as wholly "timeless" or do we find ourselves forced into the notion of a sort of "time beyond time," in which God—if I may be permitted to identify our omniscient observer theistically—perpetually contemplates all the events in the space-time continuum. Does not the very notion of an act of contemplation entail the element of duration, even if that duration is in a different time frame from that in which the events of the world of experience succeed one another? In other words, does the broader concept of time necessarily involve motion and measure, or may it not rather refer to a more radical mode of Being itself? To say that God's time is not our time is not the same thing as saying that his mode of being is wholly non-temporal.

Iamblichus retained some meaning for "earlier" and "later," if not for "past" and "future" in the world of *Noëta*, and the question inevitably arises as to whether this distinction must not also have some sort of meaning in the One—the source of all reality.

Iamblichus, of course, like other Neoplatonists, would admonish us that this is a question that cannot properly be put, for we must not assign predicates to the One—not even those of being and non-being. I find it easier to regard the injunction as grounded not so much in ontological necessity as in epistemological nescience. If I am really ignorant of the nature of the Absolute, I should be at least as reluctant to use terms like "timeless" and "spaceless" in describing it as I would be to refer to it as "ubiquitous" and "pan-temporal." To be beyond time as experienced in the phenomenal world may possibly be more like time than like timelessness if timelessness is thought of as a complete absence of "going-on-ness." If, in spite of everything, I find that, like most Neoplatonists, I cannot speak of the One at all without ascribing some sorts of properties to it and if those properties must be analogically related to those we know from our

awareness of the lower hypostases, I am likely to find it difficult to avoid the idea of a "time beyond time" as ultimate.

Those attracted to spatialized conceptions of time may find some notion of this sort essential to the formulation of a coherent ethical theory. The realm of space and time is the theatre of moral activity. Spatial location makes possible situations in which individuals can behave well or badly toward one another. As for time, it is difficult, if not impossible, to imagine what could be meant by referring to a moral act as timeless. Dean Inge often acknowledged the problem this fact poses for the Neoplatonist. "Time, it is often said, is the form of the Will," he wrote in his *God and the Astronomers*, "and it is the moral Will which cannot dispense with a real process in Time" (119).

He immediately tried to lessen the damage of this concession by saying, "Moral goodness, however, is only one of the absolute values. Neither Truth nor Beauty depends on Time to anything like the same extent" (119). The moral question, however, loomed large in Inge's mind, and he never settled it to his complete satisfaction. Forced by his adherence to the Christian faith to take the matter seriously, he concluded "on a note of indecision":

That events in Time are relevant to the eternal order is the belief of Christianity. Things of lasting moment really happen; souls are saved and lost. Whether the eternal mode of existence can really be deflected in any way by happenings in Time, is a question which I shall not attempt to answer. The philosophical difficulties in the way of an affirmative answer are great; but Christians have always believed that in the personal life the consequences of right and wrong conduct on earth are decisive for the condition of souls in eternity. (124)

Some philosophers of an idealistic bent have set no great store by the preservation of freedom in their systems. Others have thought it extremely important to allow a place for genuinely meaningful and undetermined moral choice. Here again, it is necessary to define clearly what is meant by terms like "free will." Advocates of a rigid linear determinism are prone to accuse their opponents of belief in a universe so radically chaotic as to be destructive of the sort of prediction scientists regard as essential to their disciplines. The criticism has lost most of the

cogency it might ever have been supposed to have with the growing recognition, even in the most precise of the physical sciences that at bottom no predictions based on empirical observation can lay claim to anything more than a high degree of statistical probability. Paradoxically, some of the most ardent defenders of rigid determinism are to be found in the ranks of the psychologists and sociologists, whose predictions concerning individual or collective human behavior are hardly likely ever to aspire to as high a degree of certitude as that which is considered necessary for physical research. In fact, there can be little reason for them to resist the only concession that is needed to provide a ground for moral philosophy: the recognition that there are situations in which an antecedent event might lead to one of two or more consequent ones rather than absolutely necessitating any particular one. We might call this a "disjunctive determinism."

Traditionally, advocates of ethical systems positing moral freedom have a tendency to feel more at home with metaphysical systems that allow the future to be open-ended by virtue of its non-existence at the time at which an action is performed. Can a theory of time like that of the Neoplatonists accommodate the modest degree of disjunction required for genuine free will?

The difficulties are obvious. If past, present, and future are frozen together in a sort of "eternal now" in a "more real" domain, the relations among events, seen *sub specie aeternitatis*, are essentially spatialized, and the future would seem to be as fixed as the past. In such a view, if the notion of action is to be taken at all seriously, any particular act must have its "real" being not in the phenomenal world in which it appears to occur but rather in *Nous*, and possibly even in the One. To put it in broader terms, in philosophies of this sort, actions manifested in time must originate in eternity, and in eternity, strictly speaking, events *are* but do not *happen*. In view of the fact that they have no alternatives, a true disjunctive determinism would seem to be precluded. To assign moral responsibility to an individual for his or her actions, it would be necessary to assume that somehow a timeless decision is being eternally made about the whole course of the person's life, as if an author, writing in the first person were able to *will* an entire drama into Being all at once and to *will* all his own actions as protagonist to be coordinated with those of everyone else in the drama. If we imagine a number of authors

cooperatively producing the work in question, the situation becomes complicated in the extreme. If the real world is conceived in this way, while there is, perhaps, freedom in the single eternal choice, the whole fabric chosen in that act—if it may be called an act—has the crystallized character of a completed past, and there is no freedom to intervene at any point within the fabric to choose an alternative future act.

But in our literary analogy, the author of a work is, of course, not operating from a timeless framework. He is producing and reviewing it in his own time—a time different from that of the characters in the work, but a time nevertheless, in which events of the novel could possibly be disjunctive in a way quite different from that which would be the case if our writer were outside of time altogether.

He is at liberty to edit. If in his time, he wishes to change something he has written, he can, so to speak, enter into the time-frame of the narrative, alter an event, and—if he is the only author—make all the events stemming from the alteration consistent with it, or—if there are co-authors, work with them in their common time to achieve the desired synchronicity. It was, something of the sort that J. W. Dunne had in mind when he pointed out that the act of moving down a world line containing all the events in the life of an individual would “take time” and that the time thus taken would have to be in another dimension which he designated as “time two.” From there, he was led on to the conclusion that there must be an infinite series of such temporal dimensions, all “at right angles” to one another. If his conclusion seems somewhat bizarre, the reasoning behind it was solid in terms of his conviction that a future foreseen in a dream could be altered. If we are going to talk about changing a future that has some sort of real existence, there is no point at which we can take refuge in ■ static eternity. There must always be a “time” from which the action is initiated, no matter how remote that “time” may be from the one in which the action appears to occur.

In conclusion, let me make it clear that I am not urging the acceptance or rejection of any particular theory of space and time. If the effect of the denial of any significant kind of reality to them is imagined as the shrinking of space to a point without magnitude and time to an instant without duration, not only do we eliminate

the possibility of moral freedom; we destroy any possible locus for a world of shoes and ships and sealing wax and cabbages and kings. If, on the other hand, we regard the realm beyond the space and time of our everyday experience as somehow containing potentially or actually all these items and their history, it would seem that we are impelled to think in terms of something analogous to extension and “going-on-ness” even in the eternal contemplation of them.

## The Influence of Plotinus on Bergson's Critique of Empirical Science

Curtis L. Hancock

That the philosophy of Henri Bergson is significantly influenced by the doctrines of Plotinus is indicated by the many years Bergson devoted to teaching Plotinus and the many parallels in their respective philosophies. This influence has been discussed at some length by Bergson's contemporaries, such as Émile Bréhier and Rose-Marie Mossé-Bastide.<sup>1</sup> Nowhere is this Plotinian influence more apparent than in Bergson's treatment of the natural world. In fact, his most refined formulations about the physical universe appear to have taken shape after his lectures on Plotinus' fourth Ennead at Collège de France, 1897-1898.<sup>2</sup> In this article I will outline ways in which Plotinian elements appear to work their way into Bergson's philosophy, especially his account of empirical science. In pursuit of this objective, this study will thereby provide further evidence that Neoplatonism is alive in twentieth century thought. While Bergson's philosophy does not have the following it enjoyed during the first few decades of this century, still the effects of Bergsonism are evident in certain contemporary philosophical groups, especially among "pragmatists, postmodernists, psychologists, and theologians."<sup>3</sup> Accordingly, through the descendants of Bergson a vestige of Neoplatonism perdures into the late twentieth century.

It is not surprising that Bergson would find Plotinus' writings congenial to his thought. Plotinus surely satisfies his taste for a philosophy that eschews system-building. Unlike many modern philosophers, Bergson will not brook a philosophy developed out of *a priori* principles, or erected *more geometrico demonstrata*. As writers, both Plotinus and Bergson approach philosophical issues in much the same way, taking up particular problems and challenges and letting their thought naturally unfold in response to

those problems.<sup>4</sup> Bergson's response engenders the many familiar topics associated with his philosophy: life, time, movement, memory, unity, sympathy, intuition. These are all expressions that have, of course, their counterpart in Plotinus' lexicon, a catalogue of terminology and doctrine which appear to have their influence on Bergson. To explore these parallels and points of influence, I have decided to focus on Bergson's critique of empirical science. Such a focus will give manageable dimensions to my discussion, given the limits here of the Bergsonian categories of time and space. But while I will concentrate on the theme of science, I cannot avoid borrowing on issues from the full range of Bergson's philosophy, since his thought, like that of Plotinus, tends toward monism and thus encourages the scholar to appeal to the many sympathies and interdependencies in the various elements and principles of his philosophical explanations.

### 1. Mysticism and Intuition

It is often difficult to prove one thinker's influence on another, especially when interpreting a philosopher such as Bergson, who wrote in a lyrical and sometimes cryptic style. Fortunately, however, Bergson supplies us with at least a few passages richly suggestive of Plotinus' influence. Some of the more significant passages concern Plotinus' mysticism, which, even though it may not appear so at first consideration, is indeed related to Bergson's critique of modern science. The following text from *The Two Sources of Morality and Religion* (1932) is instructive:

In our eyes, the ultimate end of mysticism is the establishment of a contact, consequently of a partial coincidence, with the creative effort which life itself manifests. This effort is of God, if it is not God himself. The great mystic is to be conceived as an individual being, capable of transcending the limitations imposed on the species by its material nature, thus continuing and extending the divine action. Such is our definition. We are free to posit it, provided we ask ourselves whether it ever finds its application, and then whether it fits such and such a particular case. As regards Plotinus, there is no doubt about the answer. It was granted to him to look upon the promised land, but not to set foot upon its soil. He went as far as ecstasy, a state in which the soul feels itself, or thinks it feels itself, in the presence of God, being

irradiated with His light: he did not get beyond this last stage, he did not reach the point where, as contemplation is engulfed in action, the human will becomes one with the divine will. He thought he had reached the summit: in his eyes, to go further would have meant to go downhill. This is what he expressed in language of rare beauty, yet which is not the language of thoroughgoing mysticism. 'Action,' he said, 'is a weakening of contemplation.'

In this passage Bergson is saying a number of things, which, once explicated, will begin to bring into perspective how he assimilates Plotinus' philosophy in his assessment of modern science. First, Bergson salutes Plotinus for having realized that reality can be grasped through mysticism. It is no surprise, of course, that Bergson would commend him for this. Bergson sees in Plotinian mysticism a doctrine equivalent to what he calls "intuition," which signifies an immediate experience of reality; or put negatively, an experience of reality that is not mediated by conceptualization or analysis. However, Plotinus, Bergson laments, did not take the final step, which is to turn mysticism into a *method* applying it to all the problems of philosophy, and even science. It might seem odd to speak of mysticism, or Bergson's equivalent, "intuition," as implying a "method," but this is an important part of Bergson's philosophy of intuition, following upon his insistence that philosophical reflection must begin correctly. Appreciating that reality is grasped in intuition is essential to providing that sound starting point. All methodical developments are grounded in intuition and are directed by it. Philosophical method is an explication of reality grasped intuitively.<sup>6</sup>

Intuition is the alpha and omega of successful philosophy. Hence, it is an error to limit intuition (or mysticism) to a transcendent experience. Mysticism is not the capstone of contemplation; it is the apprehension of reality on every level of existence. Philosophy is successful when it adopts the right method and makes the right distinctions so as not to distort this apprehension of reality, or to detect it when it does occur, as it inevitably does in the explanations of science. The application of intuition must be total in philosophy. *Praxis*, as well as *theoria*, makes sense only when explained according to the light of intuition. Accordingly, Greek philosophers like Plotinus went wrong in limiting mystical intuition to the realm of contemplation. Mystical intuition must also belong to the realm of action. This

point is important because in Bergson's philosophy science is a special organ of the realm of action, for action aims at command of nature, and the work of intelligence and scientific analysis aims at such command. Hence, if science, as well as all other reflection on the world of action, is to be correctly understood, it too must be explained under the light of our basic intuitions. Intuition must guide our understanding of science as much as it governs all other reflection.<sup>7</sup>

Bergson, then, seeks to bring our mystical sensibility back to the natural order, to reattach our intuitions to reality lived in the everyday, where our very selves are united to and merged with reality. The great mystics of the past did not go far enough; they mistook detachment from everyday life as a condition for the discovery of life. Immediately following the above quotation from *The Two Sources of Morality and Religion*, Bergson makes this point even more directly.

...he [=Plotinus] remains faithful to Greek intellectualism, he even sums it up in a striking formula [that "action is a weakening of contemplation"]; and at any rate he did contrive to impregnate it with mysticism. In short, mysticism, in the absolute sense in which we have agreed to take the word [i.e., to apply to action as well as contemplation], was never attained by Greek thought. No doubt it would like to have come into being; as a mere virtuality, it knocked more than once at the door. The door opened wider and wider, but never wide enough for mysticism wholly to enter.<sup>8</sup>

Thus, two things are clear: (1) that Bergson is sufficiently impressed with Plotinus' mysticism to be open to its influence, and (2) that he envisions his own doctrine of intuition to be a deeper and more complete application of Plotinian mysticism. In sum, Bergson regards Plotinus with a certain ambivalence, an ambivalence that we will see repeated in other ways. On the one hand, he acknowledges that Plotinus is a special voice in the history of philosophy, but, on the other, he insists that his example should be improved upon. "It was granted to him to look upon the promised land, but not to set foot upon its soil."

Of course, one is tempted to protest here that Bergson's interpretation of Plotinus may be mistaken and unfair. Plotinus' account of remanation tries to give mystical intuitions an application in diverse ways, including experiences of the natural

world and of human moral practice. Regardless, the important point at this stage is that, to the extent Bergson is open to Plotinus' influence, it is not unqualified. He will transpose Plotinus according to his own needs. So it is that he appropriates Plotinus' mysticism, employing it in a way, as it will happen, that furnishes a critique of modern empirical science.

## II. Duration, Space, and Mechanistic Science

For Bergson the strength of Plotinus' mystical philosophy is this: it provides a kind of awareness (although a knowing that is paradoxically "not knowing") that transcends the limits of other kinds of knowledge. From the perspective of mystical knowing, the philosopher is in a position to express truths about reality comprehensively and intelligently. This he can do because he will no longer assume that one partial perspective on reality, such as mechanistic science, will sufficiently capture it. All of the incomplete accounts of reality will now be subalternated to the comprehensive vision of a higher consciousness—mysticism for Plotinus, intuition for Bergson.

Plotinus' genius was his ability to bring into synthesis the two great currents coincidental in ancient philosophy: Orphism and dialectics.

True, no influence of this kind [i.e., Orphism] is noticeable in Aristotle and his immediate successors; but the philosophy of Plotinus, in which the development culminates, and which owes as much to Aristotle as it does to Plato, is unquestionably mystic. If it has undergone the influence of Eastern thought, so very much alive in the Alexandrine world, this occurred without the knowledge of Plotinus himself, who thought he was merely condensing all Greek philosophy, with the whole object of opposing it to foreign doctrines. Thus, to sum up, there was in the beginning a leaven of Orphism, and at the end a metamorphosis of dialectics into mysticism.<sup>9</sup>

As Bergson sees it, managing the proper relationship between Orphism, the intuitive or mystical strain in philosophy, and dialectics, the intellectual, conceptual, or analytical element, is as much the task of philosophy today as it was in Plotinus' time. By "dialectics" Bergson means the science of the One and the Many,

and therefore it is not surprising that Bergson would be attracted to Plotinus, whose vision of reality turns on the contrast between unity and multiplicity.<sup>10</sup> For Bergson the problems of philosophy consist in discerning multiplicities and overcoming them. For this reason one finds two tendencies always evident in Bergson's writings, aims which are coincidentally operative in Plotinus: (1) to discover dualisms and draw out their implications, and (2) to transcend these dualities in a higher, intuitive vision of reality. For Plotinus everything but the One is subject to duality and fragmentation. Indeed, it is precisely because the One transcends dualistic analysis that it merits being the highest hypostasis.<sup>11</sup>

Bergson's litany of dualisms is famous: matter-memory, perception-recollection, space-time, quality-quantity, heterogeneous-homogeneous, continuous-discontinuous, contraction-relaxation, instinct-intelligence, etc.<sup>12</sup> These dualities are ways of expressing problems of dialectics, which may be expressed as the problem of the One and the Many, but may also be expressed as the problem of distinguishing differences of degree from differences of kind. The problem with much of scientific inquiry and explanation is that it confuses differences of degree with differences of kind. This is Bergson's way of saying that the modern scientist's world-view interprets everything from the standpoint of quantity, imagining that there is a space, a homogeneous, quality-less medium in which everything occurs. This assumption prejudices the case for a mechanistic and reductionist view of nature, so that quantities, differences of degree, are taken as real, and qualities, differences of kind, are nullified, reduced to mere illusions. Due to the influence of Galileo, who believed that reality is found on a corpuscular, particulate, micro-physical level, and due to the influence of Descartes, who believed that nature should be wholly quantified, spatialized, mathematicized, the prejudice of materialist mechanism has become the scientific orthodoxy in modern times. The way to overcome this reductionism is not to take that first question-begging step in which one pre-judges that the reality of something is spatial, i.e., ultimately verifiable in terms of quantitative, mathematical analysis. Errors of this type, Bergson argues, lead to disciplines like contemporary psychology in which the human mind is quantified and spatialized as mere brain states. To confuse the reality of duration with the conception of space need not occur once

the philosopher sees that duration differs from space not in degree, as matters *within* space so differ, but in kind. This is difficult for modern minds to grasp, since in the wake of Cartesianism we think of duration itself, i.e., time, as a measurable, spatialized, mathematicized thing. But duration is an experience intuited in our inner life wherein there is qualitative, not quantitative, interpenetrating of changes. Time is rendered a quantity, thought of as a unit or series of units, by abstract analysis. But abstraction is not the same as intuition. Abstract analysis or conceptualization spatializes and "fixes" experiences, whereby the intellect, of which science is a product, can control its environment, mainly for adaptation and survival. Conceptualization represents or refashions reality, i.e., the experience of duration, into an abstraction, an intelligibility, which is to say that it has become accessible to the intellect. Reality itself, not its mere representation, is known by intuition, which immediately and non-conceptually grasps its object—duration or life. Furthermore, intuition knows it in its "virtuality," as a qualitative whole, which is only potentially reducible and analyzable to the functions of the intellect. As a qualitative whole life flows with a rich spontaneity, an unpredictability not constrained by the concepts of mechanistic quantification. Does this mean Bergson enthusiastically embraces a teleological view of nature? "No," comes the reply. Mechanism and teleology constitute a false duality. Teleology is as much a mistake as mechanism. Just as mechanism falsely constrains life by the fiction of quantification, teleology limits it by imposing on it an *a priori* interpretation demanded by an abstract, conceptualized, static final cause. Both these alternatives strip life of its spontaneous energies, order it according to fixed laws, and inevitably entail determinism.<sup>13</sup>

Plotinus would surely disagree with Bergson's dismissal of teleology as a principle of nature, as I shall make clear at the end of this essay.<sup>14</sup> Nonetheless, Plotinus would probably agree with Bergson's assessment of mechanism. Additionally, the above summation captures several other points which have their analogue in Plotinus. First, it is certainly the case that Plotinus believes that an intuitive, mystical experience grasps reality in a way that rational cogitation, with its implicit dualities and discriminations, cannot. In fact, throughout the *Enneads* Plotinus protests against the common philosophical illusion that dualisms cannot be

surpassed in knowing reality. Plotinus recognizes that dualities must be given their due, but his over-all monistic vision of reality refuses them the last word.<sup>15</sup> Hence, he often repeats what he says in Ennead VI, 9 (9) that the One transcends even the most universal of Platonic dualities: the *megista genē* of the *Sophist*, which Plotinus projects into the intelligible world of the second hypostasis. Accordingly, the One is neither sameness nor difference; neither motion nor rest; nor is it being!<sup>16</sup> To think it must be constrained by these categories is to presuppose that rational awareness—conceptualization and analysis—is absolute; that the perspective of rational cognition is the only kind of knowledge. But mystical awareness, apprehending its object without the disrupting disunities of rational consciousness, attests to another way of knowing. The distinctions of reason are not bankrupt, only incomplete. Their limits are transcended in the higher intuition of mystical union. It is difficult to imagine that Bergson could have read Plotinus carefully and not have come under the influence of his account of the limits of rational analysis and of his belief that an intuition of a non-conceptual sort is necessary for reality to be grasped.

Even the awareness of *Nous*, the perfect rational being, comprehends its objects—the totality of beings/intelligibles—in an intuition, wherein all the elements—all these divine intelligibles—are actually present in every other. Hence, it is only by rational analysis that the intelligibles are discriminated and separated from one another. In reality, they exist as one with *Nous* and *Nous* as one with them. Accordingly, *noēsis* and *noēton* are really the same, only distinct by analysis and rational reflection. Hence, Aristotle was right, Plotinus tells us, to describe Intelligence as *noēsis noēsēos*, for the objects thought are really the same as the thinker.<sup>17</sup> There is a sympathetic interrelation present to all the elements of the intelligible world that could provide a Plotinian analogue for what Bergson is trying to say about all the “virtualities” contained in the experience of nature. The intellect can by abstract analysis divide up and isolate “components” of reality. Duration, the human experience of life itself, is subject to this kind of analysis. Duration is “virtually” everything that is subject to analytical separation and discovery. Science and philosophy take this undifferentiated experience of duration, which is actual, and subject it to conceptual explication. While duration

is real, it is in potency to all the many differentiations of kind and of degree that philosophy and science can make actually explicit through conceptualization and analysis. In order to exhaust the many ways in which the human person can approach life and make sense of the world, conceptual philosophy and scientific analysis both have their place. One must remain cautious, however, of interpreting their perspectives as authoritative. Bergson's view of philosophy here parallels in many ways Plotinus' own, since the ancient Neoplatonist often speaks as though philosophy is an inadequate narration about the highest reality, the One, which can only be known by mystical union. Talk about God we must, since short of mystical experience, there is nothing else to do, but we indulge this philosophical discourse on account of human needs and circumstances, not because it really says anything significant about the One/Good.<sup>18</sup>

### III. Ambivalence Revisited

A consistent theme throughout Bergson's writings is that metaphysics is not the same as empirical science. The object of science is matter, whereas the object of metaphysics is spirit. Bergson resists the reductionism implied by physicalism and quantification in modern science. Modern philosophers, as well as scientists, have deluded themselves, he insists, in thinking that metaphysics is impossible or, at least, unnecessary. Scientific knowledge, which modern philosophers regard as genuine, is unintelligible unless situated in a broader vision of reality, a vision that metaphysics alone can supply. In short, science does not judge metaphysics; science must answer to the latter's authority.<sup>19</sup>

Bergson's attitude toward natural science is not unlike Plotinus' own view of the natural order. I am aware of the dangers of anachronism in a study of this kind. So I merely point to similarities, aware of the fact that modern science *per se* is not something Plotinus, as an ancient thinker, could know. Nonetheless, similarities can be carefully identified. To begin with, Plotinus agrees that in order to understand fully the principles and operations of nature, a more comprehensive philosophical explanation is required. And yet, ambivalence emerges again in Bergson's attitude toward Plotinus. While Bergson accepts that an

empirical account of nature cannot stand alone, that it must be explained according to the higher light of intuition, Bergson will not accept Plotinus' appeal to the principles of Platonic dialectics as elements contributory to an explication of reality. That would be to commit the error of Greek intellectualism. And in the last analysis the *Enneads*, for Bergson, represent a damaged philosophy, spoiled by a commitment to the Greek intellectual tradition, a legacy which Plotinus should have altogether rejected. The reason for his disapproval is this: whereas for Neoplatonists, intuition becomes stronger as more universality is achieved, for Bergson intuition is in principle compromised by universality, since this implies abstraction, analysis, conceptualization—all of which terms signify the "spatializing," "fixing," and "distorting" character of intellectual representation of the real. For Plotinus intuition is directly proportionate to universality up to that point at which universality is altogether transcended in mystical union. But universalities—the noetic natures of beings in the intelligible world, i.e., Plato's Forms, to the extent that they participate, however imperfectly, in the unity of the transcendent One—manifest reality to a considerable degree. While all the Forms define the life of *Nous*, they are nonetheless analyzable into a multiplicity of logically distinct *ousiai*, a multiplicity which slightly compromises the reality of the intelligible world, since to be real is to be one. Still, Plotinus is committed to the view that the Platonic intelligibles are valid objects of the intellect, necessary conditions as a stage in its mystical ascent and divine *noeta* in their own right.<sup>20</sup>

It is the result of Bergson's "methodism"—by which he extends intuition even to the realm of practical life and science—that he constrains the abstract intelligence to a very limited purpose, and at times seems to reduce it to a creator of fictions. Given this attitude, Bergson is bound to reject Greek intellectualism even if championed by a philosopher like Plotinus whom he admires otherwise. To think that a dialectical use of universals can express reality, which is duration, is an illusion. Such expressions have their value because they help the human mind adapt to its world, not because they inform us about reality. Bergson prefers to employ the term "virtuality" as a foil against "universality." The unitive, qualitative reality of duration is a "virtuality" in the sense that it contains the potentiality for all those distinctions,

demarcations, discriminations that abstract intelligence can derive from it when spatializing and quantifying that which is really temporal and qualitative.<sup>21</sup> Professor Mossé-Bastide and Émile Bréhier suggest that the act of intelligence for Bergson is reminiscent of what the second hypostasis seems to obtain in its moment of *epistrophê*: it apprehends reality in its own limited way, fragmenting its object into a plurality of beings.<sup>22</sup> But the comparison should not be overstated, for Bergson seems to render the intelligence cognitively ineffectual in a way that Plotinus does not.

In sum, Bergson reproves Greek intellectualism, and by association Plotinus, because it mistakes a difference in kind for a difference of degree: it mistakes time for space because it thinks the former, reality itself, is accessible through the spatializing and quantifying of abstractions. Like Plotinus, Bergson rejects mechanism because it falsely assumes that space, quantity, and mathematics are sufficient explanations of reality. However, to make his case he does not appeal to higher metaphysical intelligibilities. For Bergson this Platonizing of experience undermines our contact with the real as much as spatializing and mathematicizing experience does. In fact, Platonism, which finds reality in abstract, universal, fixed intelligibilities, and Cartesianism, which finds reality in measurement and mathematics, are both symptoms of the same error: mistaking the abstract for the real, which, for Bergson, means confusing space and time. Hence, while Bergson may borrow from the *Enneads* to develop his own thought, his dependence on Plotinus is selective, always on guard against the taint of Platonism, which substitutes intellectual construction of reality for an intuitive grasp of it. In light of this, Richard Wallis has accurately expressed Bergson's relationship to Plotinus: "Bergson's thought can be viewed as an attempt to restate Plotinus' philosophy of Soul (*significantly ignoring his eternal Intelligible world*) in terms of scientific ideas....[italics mine]."<sup>23</sup> Of course, Bergson believes that to ignore Greek intellectualism is an advantage, but in the end it makes his position open to the charge of irrationalism, as I will point out at the close of this essay.

Still, in spite of this important divergence, Plotinus and Bergson are alike in the way they react to the prevailing orthodoxies of natural philosophy in their respective periods. And

in the case of Bergson this similarity further relates to his views on modern science. Their agreement centers on a corresponding attitude regarding the status of quantity as an object of knowledge. Both agree that quantity is *not* a proper object of metaphysics. While Plotinus demands that higher Platonic universals must supply the content of a satisfactory metaphysical account of the natural world, and while Bergson rejects Platonism as a mistake, there is still in principle a requirement on the part of each that metaphysics—not a philosophy or science of quantified particulars—must explain nature. This condemnation of quantity as an improper and unreal object of intuition is shared by them both. This disapproval of quantity is behind Plotinus' rejection of the Aristotelian categories as valid objects of knowledge as much as it is behind Bergson's dismissal of mechanistic science. In VI, 2 (43), chapter 13 Plotinus explains that quantity cannot be an object of science (taking *epistēmē* in the broadest sense—as equivalent to the Latin *scientia*) because true objects of knowledge exist as pure forms or beings in the intelligible world. Quantity, however, cannot be a form (*eidos*) or genus (*genos*) descriptive of beings in the intelligible world. His argument in brief is as follows: Quantity is either discontinuous, i.e., number, or continuous, i.e., extension or magnitude. But the unity of intelligible being, in which all genera are really identical with one another, precludes number. And the genera cannot be magnitudes, since they do not contain matter. Hence, quantity is not among the primary genera, the true objects of knowledge. Quantity, along with the other Aristotelian categories are pseudo-epistemic principles having as their objects changing, sensible existents which are but shadows of reality. Ennead VI, 1 (42) and VI, 3 (44) complement what Plotinus says in VI, 2 (43), providing him also an opportunity not only to reject the Aristotelian categories as pseudo-scientific principles but the Stoic categories as well.<sup>24</sup>

As Plotinus' comments regarding quantity and the other categories are transparent in his writings, it is quite probable that Bergson took Plotinus into account in fashioning his own view about quantity, including his views on the quantitative limits of mechanistic science.

#### IV. The Mind-Body Relationship and The Science of Man

Historians of philosophy align Bergson with the spiritualist movement in France. Bergson's work, *Matter and Memory*, supports this affiliation, since the book aims to show that reducing human experience to brain states alone is mistaken. Human experience requires an explanation that includes the non-physical. And for Bergson this implies many cognitive and moral consequences attesting to the full range of man's spiritual life. Still, matter must be given its due. Plotinus, too, refused to reduce human consciousness to a mechanistic explanation, even if he opposed an ancient mechanism rather than a modern one. Many of the illustrations and distinctions Bergson employs appear to have Plotinian inspiration, especially seated in treatises from the fourth Ennead. This influence should become evident once I summarize Bergson's position on the mind-body problem.

French philosophers, no matter how hard they may try, seldom transcend all the effects of Cartesianism on their philosophical education. Bergson is no exception. Accordingly, it comes as no surprise to hear him declare that his philosophy of the human person is decidedly dualistic. In Bergson's language this is to say that body and mind differ in kind and not just in degree. He believes there is strong evidence for this difference, especially if one regards common sense awareness as counting for knowledge. Such awareness instructs the knower that he has a consciousness that observes not only mental states but also bodily ones. These latter are not just known by perception but also "from within by affections."<sup>25</sup> This common sense awareness provokes the philosopher to ask "What is the relationship of mind to body?" The reductionist, of course, is quick to answer: the relationship is either one of identity—in the form of central state materialism, according to which mental and brain states are the same—or of complete causal dependency—in the form of epiphenomenalism, according to which mental states are not identical with cerebral states, but they have no causal efficacy of their own. The reductionist boasts that the evidence is overwhelmingly on her side: Is not the mind clearly affected by the body? Is it not demonstrable by ordinary experience and by scientific experiment that when brain undergoes change or accident mental powers are affected? Since such effects are evident, say, in the cases of brain disease or accident, it is

reasonable to conclude that brain states alone explain the human person.

Bergson's reply is that the philosopher is under no obligation to accept the reductionist's interpretation of the evidence. Aware of the popularity of reductionism, Bergson labored to provide lengthy, alternative explanations to the significance of brain disease and trauma. For this reason, his writings contain long passages where he addresses aphasia, amnesia, and an assortment of brain debilities. The aim of his comments is to show that all we must concede to the reductionist is that brain is a necessary condition for human behavior; however, we need not concede that it is a sufficient one. If one grants the teachings of the evolutionists, Bergson argues, then one may interpret the brain as nothing more than a motor assist to the needs of the organism. Consciousness, however, is something over and beyond these needs. When the motor support of the brain is damaged, this does not necessarily mean that the mind is itself damaged, but only that the translation of a perceived need into activity is impaired. For Bergson the body is "an instrument of action, and of action only."<sup>26</sup> As a result of this different interpretation of the evidence, reductionism is acknowledged as the prevailing orthodoxy among scientists but is not esteemed as philosophically demanded.<sup>27</sup>

To reinforce his critique of materialism, Bergson elaborates on the nature of memory. This is important because, again, the reductionist claims memory is affected by changes in various sites of the brain. He goes beyond his earlier argument, which I have summarized above, by furnishing a detailed account of the nature of memory. The reductionist is right to regard memory as central to the mind-body problem: memory is precisely where the liaison of mind and brain is understood. But, Bergson insists, there are two kinds of memory: (1) memory as mechanical repetition or bodily habit—automatic organic movements patterned after a succession of behaviors, resulting in a disposition or bodily aptitude (walking is an obvious example); (2) memory in the pure sense as retaining representations of past events—a spiritual cognition since these do not necessarily aim at action as do habits. The error of materialist reductionism is that it confuses these two types of memory. The reductionist fails to grasp that these are distinct in kind. These differences are virtual to the composite, duration. Bergson's intuitive method demands that this composite be analyzed correctly.

In short, he argues that he supplies this correct analysis, reflections which help us philosophically deepen our awareness of duration, whereas the reductionist has given an incorrect analysis, mistaking differences in kind for differences of degree.

Moreover, just as scientific reductionism mistakes these types of memory as differing only in degree, likewise it errs when judging the difference between recollection and perception. The error of the physicalist is to explain the former as a weaker version of the latter. These experiences are next quantified, explained in terms of different intensities. As Hume said, recollection differs from perception because it is a less vivid, less intense, impression. But this interpretation in terms of degree and intensity is a mistake, according to Bergson. Clearly, recollection and perception differ in kind. Quite simply, perception is of a present object, but recollection is of a past representation.

There is a further difference, a difference Bergson identifies in keeping with his evolutionary doctrine that our experience of present events and objects is largely dictated by needs. In light of this doctrine, Bergson regards perception as having primarily a utilitarian character and observes that it is "entirely oriented towards action."<sup>28</sup> Perception is limited by and focused on particular things, their presence to perception requiring a response to specific needs. Perception abstracts a specific object from the background of total experience and gives it full attention. This means that there is an entire world of experience to which perception is indifferent—a world "negated" and "ignored" by perception. It is the philosopher's task to recapture this world, which can be done by reflecting on the nature of memory, which comprehends the full range of living experience, past and present, oriented to the future. Hence, it is recollection or memory that chiefly uncovers for Bergson the fullness of human experience, the consciousness of duration, and the depth of the self. Of course, it is important to note that when Bergson contrasts recollection and perception he is analyzing experience according to the requirements of philosophical reflection, which is to help us explicate different elements and dimensions of life (variously described as "reality," "duration," "*elan vital*"). In other words, he is contrasting recollection with "pure perception," not "concrete," or "actual" perception, which, as an experience of the full person, must involve recollection as well. "Perception is never a simple contact of the

mind with the present object. It is wholly impregnated with memory-images which complete it while interpreting it."<sup>29</sup>

As has already been noted, Bergson believes that a central error of modern science is to think of time in a spatialized, mathematical sense. This is to think of time as succession, a fictionalized representation of duration which likens experience to a collection of units, and generates the kinds of puzzles and errors to which Zeno succumbed. A philosophy, however, that rightly understands memory will overcome this error, for memory "recovers" and "uncovers" the reality of the past in human experience, i.e., in the life of duration. This reality is not just a psychological fact; it is ontological as well. Since time and space are really different from one another, and since to think of the present alone as real is to spatialize time along a line wherein the past has ceased to be, the experience of duration is a simultaneous interpenetration of present and past. Hence, the past has ontological significance: the past is an on-going living, qualitative, not quantitative, dimension of duration, which is reality.

Memory awakens us to a deeper self. Whereas perception abstracts from reality so as to satisfy needs, memory represents and recaptures experiences, events, and meanings which transcend the requirements of present objects. Bergson eloquently expresses the primacy of memory in his Huxley lecture of 1911.

A consciousness that retained nothing of the past would be a consciousness that died and was re-born every instant—it would be no longer consciousness. Such is just the condition of matter; or at least it is just the way we represent matter when we wish to oppose it to consciousness. Leibnitz defined matter—that is to say, what is not consciousness—by calling it momentary mind, an instantaneous consciousness. And in fact an instantaneous consciousness is just what we call unconsciousness. All consciousness then is memory; all consciousness is a preservation and accumulation of the past in the present.

Recollections stimulate our consciousness to a deeper awareness; they influence our lives even when we are not attending to them directly. The past is as real as the present and both a sound psychology and ontology must acknowledge the power of the past. Speaking of its ontological status:

The past and the present do not denote two successive moments, but two elements which coexist: One is the present, which does not cease to pass, and the other is The past, which does not cease to be but through which all presents pass. It is in this sense that there is a pure past, a kind of "past in general": The past does not follow the present, but on the contrary, is presupposed by it as the pure condition without which it would not pass. In other words, each present goes back to itself as past. The only equivalent thesis is Plato's notion of Reminiscence. The reminiscence also affirms a pure being of the past, a being in itself of the past, an ontological Memory that is capable of serving as the foundation for the unfolding of time. Yet again, a Platonic inspiration makes itself profoundly felt in Bergson.<sup>30</sup>

Memory, then, is the ground of duration and the source of our spiritual lives. To perception belongs matter; to memory belongs spirit. As a corollary to this dualism, the human person is defined in terms of two selves: a higher and a lower self; or a deeper and superficial self. Our ordinary consciousness defines a spatialized, empirical self in contact with material objects for the purposes of action, but our deeper, metaphysical awareness uncovers a self in contact with spirit, reality, duration.

Bergson's distinction between a higher and a lower self is reminiscent of Kant's contrast between a phenomenal and a noumenal self. But the distinction has a basis in Plotinus as well. That memory can recover the ontological ground of things is a way that both Plato and Plotinus characterize; higher consciousness, an understanding informed by *logoi* and *noēta* which require the human soul to commune with the intuitive power of the Cosmic Soul and the Divine *Nous*. Plotinus' interpretation of Plato's allegory of the cave and the doctrine of *anamnesis* would naturally be attractive to Bergson. The *Enneads* interprets Plato's doctrine of ontological memory "as denoting not a temporal recovery of what the soul knew in the past, but an awakening to what her true self knows eternally."<sup>31</sup> Bergson is surely aware of this Plotinian interpretation since it occurs at the heart of the fourth *Ennead*, with which he had a special familiarity. He would find in it a view parallel with his own conviction that spiritual integration is achieved by reflective awareness of the power of memory and its content in our lives. This is Bergson's way of echoing Plotinus' call to a higher consciousness.

That memory is operative in Plotinus' prescription for higher understanding, and the perfection of the deeper self, is reinforced by his distinction between habitual and pure memory, precisely the distinction found in Bergson. Plotinus explains these terms in a way similar to Bergson's account of perception, which supplies the object stimulating the mechanism of habitual memory, and which is always mixed with recollection, so that what we perceive is significantly influenced by what we have been and have become. Memory produces our disposition so that "we become what we remember" (IV, 4, 3, 6-8), reminding us that the objects of our interest, of our contemplation, eternally bear on our destiny.<sup>32</sup> For Bergson perception relies on the brain to filter the influence of memory so that nothing interfering with the contemplation of just the relevant object will obtain. Habitual memory draws on memory only to the extent specific representations of our past can contribute directly to the focused activity at hand. Plotinus, too, is struck by the fact that in habitual behavior perception draws our attention on objects according to our degree of interest, making us indifferent to objects that fail to be relevant to consciousness at the time. Like Bergson, Plotinus illustrates with ordinary activities: "For instance, if on a walk we are concerned only with the act of walking and not with the places traversed, our awareness of those places is proportionately dim."<sup>33</sup> But Plotinus goes beyond Bergson and connects the specification of perception to contemplation as a whole. Accordingly, as human souls acquire a greater integration with the higher realities, they turn their contemplation toward the spiritual and become more indifferent to matters in the sensible world. Indeed, even though the stars appear to survey the earth providentially in their orbits above us, they, in fact, care nothing about us, having their attention focused exclusively on the intelligible world.<sup>34</sup>

At any rate, Bergson's overarching thesis that our grasp of reality is informed by and grounded in memory probably reflects Plotinus' influence, since the ancient Greek philosopher was surely committed to the view that the depth of consciousness is itself proportionate to the degree that it remembers or "is awakened by" the perfect life of the second hypostasis, where pure intelligence eternally intuits perfect intelligibilities. Bergson's identification of reality with movement pure and simple probably has Plotinian inspiration, even if it results from a misreading of Plotinus.

Plotinus enthusiastically accepts Plato's judgment in the *Sophist* that *kinēsis* must belong to the realm of *Nous*. In fact, Plotinus agrees that *kinēsis* is one of the *megista genē* comprehensively defining the intelligible world and that *kinēsis* as a synonym for cognition is a description of the noetic act of the Divine Intelligence. But a creative reinterpretation of his predecessors appears when Plotinus chooses to follow Aristotle by insisting that the second hypostasis be described as pure *energeia* and that its contents be defined as perfect *energeiai*. Plotinus insists on this even though he departs from Aristotle in a significant respect: After all, for the Stagirite *energeia* is aligned with *akinētos* rather than *kinēsis*.

These comments on kinesis are ■ witness to Plotinus' independence as a thinker and are a further indication of his influence on Bergson. Still, while Plotinus may be the source of Bergson's view of movement, the Frenchman may enjoy this influence at the price of wrongly interpreting him in significant respects. For Plotinus would have no part of the irrationalism that seems to be implied in Bergson's ontology. Plotinus might react as Aliotta does: "Bergson's fantastic mysticism reduces the world to a perennial stream of forms flowing in no definite direction, a shoreless river whose source and mouth are alike unknown, deriving the strength of its perpetual renewal from some mysterious, blind, and unintelligent impulse of nature, akin to the obscure will of Schopenhauer."<sup>35</sup>

Unlike Bergson Plotinus recognizes not only the importance of *kinēsis* but also that of *stasis*, awarding it also the title *megiston genos*. Hereby, Plotinus escapes irrationalism and explains the motion of the cosmos as a mirroring on a less perfect level the ordered motion of the intelligible world. Being is *kinēsis* with *stasis*—where there is life and duration, true enough, but where life and duration have being because there is law and rationality. This is an important point clearly showing how Plotinus and Bergson, in spite of the former's influence on the latter, still must disagree about the nature of philosophy, which for Plotinus must prize the adequacy of reason at least when discussing matters short of mystical union.

This disagreement relates to inadequacies regarding Bergson's view of science. Since he lived during the third century, Plotinus' writings do not speak to the nature of empirical science in its

modern form. But if rationality and law are necessary elements of science, one can be sure that Plotinus would be at odds with Bergson's critique of science, and would probably regard it as a pitiful retreat into the sanctuary of irrationalism. And this would probably be his judgment no matter how much he might approve of Bergson's appropriate criticisms of reductionism. Again, even though Plotinus acknowledges that reason is itself overcome at the threshold of mystical union, still reason within its own purview—the world of beings and intelligibilities—is sound, valid, adequate. Against the backdrop of Plotinus' philosophy, where both *kinēsis* and *stasis*, both rationality and intuition, are given their due, one may judge Bergson's failure this way: He mistakenly assumes that the being of change requires an absence of rational structure and law, even the laws of science. Accordingly, it is very much in the spirit, if not the letter, of Plotinus to reply to Bergson in the way his contemporary, Dean Inge, responds to him. This passage speaks volumes about why a Neoplatonist can esteem science in a way that a Bergsonian cannot.

Are we then denying the truth of the kinetic aspect of reality when we postulate unvarying laws of nature? This thought is the starting-point of the vitalistic philosophies...such as that of Bergson. It is said that if reality consists of unvarying general laws, illustrated by transient manifestations which in no way affect the eternal steadfastness of the laws, the time-process is without significance, and the universe has no history. They are the expression of the life and purpose which constitute the unity of the whole in which they are embraced. Within any unitary whole there may be developments of what we call laws as well as in the processes which exhibit their working; for the laws are only the methods of operation adopted by the Universal Soul, and are uncontrolled by any necessity. Whether, as a matter of fact, the laws of nature are uniform, is to be decided by observation. But when we consider the subordination of the individual to the larger processes of the world-order, it is most improbable that our private volition should be able so to modify the course of events as to give the world the appearance of a "wild" system, which by its unaccountable behaviour administers shocks even to its Creator, as William James would have us believe.<sup>36</sup>

Later in his study of Plotinus, Inge explains in unequivocal terms why a Neoplatonic view of reality is simply incompatible with Bergsonism.

The view [of Bergson]...has some obvious affinities to the philosophy of Plotinus. But it is at bottom irreconcilable with it. It is based on the assumption—which underlies all Bergson's philosophy—that caprice and eccentricity are the marks of freedom and spiritual activity. The spontaneity of life is supposed to show itself in motiveless diversity, while regularity—all that can be predicted—is a proof of thralldom to blind necessity and mechanism. It is no wonder that superstitious supernaturalism holds out both hands to this philosophy. But such a view is abhorrent to Platonism, since it hands over nature, not indeed to a malignant power, but to a purposeless machine, and the formative and directive agency which interferes with the regularity of its working is not the Universal Soul, which for Plotinus is responsible for the whole visible universe, including those parts of it which seem to us devoid of life, but a plurality of finite spirits, who act upon the world from outside, as it were, and triumph in proportion as they can introduce the unpredictable into the predetermined. All this is contrary to the genius of Greek philosophy, and especially of Platonism. For Plotinus, the purposefulness and relevance of the world here below, across which no hard lines are drawn, are the image of the complete harmony which prevails in the eternal world. We are not driven to assign some phenomena to mechanism and others to miracle; Soul, and behind Soul Spirit, are at work everywhere.<sup>37</sup>

So, in the end, the impression of Plotinus seems evident on Bergson's philosophy of science, including his views regarding the natural and the human sciences. But in light of these closing remarks, this influence should not be taken as concurrence, nor should it encourage the judgment that Bergson is in fact a Neoplatonist.

1. See Émile Bréhier, "Images plotiniennes, images bergsoniennes," in *Les Etudes Bergsoniennes*, Vol. II (Paris: Albin Michel, 1949); also Rose Marie Mossé-Bastide, *Bergson et Plotin* (Paris: Presses Universitaires de France, 1959).
2. Bergson admits this himself in *Creative Evolution* (New York: Modern Library, 1944), p. 384.

3. William James acknowledged Bergson's influence in *A Pluralistic Universe* (New York, 1909). Gilles Deleuze is a prominent postmodernist who expresses his debt to Bergson: *Bergsonism* (New York: Zone Books, 1988). Minkowski, *Le temps vécu* (Paris, 1966), and Binswanger, *Le cas Susan Urhan* (Paris, 1970), credit Bergson as a key influence in their theories of psychiatric treatment. Of course, Teilhard de Chardin comes to mind as a theologian significantly influenced by Bergson.
4. So averse was Bergson to the dangers of apriorism in philosophy that he once said in an interview (*Mercure de France*, 1913, p. 397) that he never knew in advance where any of his conclusions would lead.
5. Henri Bergson, *The Two Sources of Morality and Religion*, Ashley Audra and Cloudesley Brereton, trs. (New York: Henry Holt and Company, 1935), pp. 209–210.
6. These remarks on intuition as method derive from Deleuze's *Bergsonism*, chapter 1.
7. See Henri Bergson, *Creative Evolution*, chapter 2.
8. Henri Bergson, *The Two Sources of Morality and Religion*, pp. 209–210.
9. *Ibid.*, p. 208.
10. Following Leo Sweeney, "Basic Principles in Plotinus's Philosophy," *Gregorianum* 42 (1961), pp. 506–516, and Plato Mamo, "Is Plotinian Mysticism Monistic?" in *The Significance of Neoplatonism*, R. Baine Harris, ed. (Albany, New York: SUNY Press, 1976), pp. 199–216, I interpret Plotinus' philosophy to be a mystical monism committed to three basic principles: (1) that to be real is to be one; that where there is unity there is reality; (2) that whatever is one is also good; that where there is unity there is perfection; and (3) that whatever is posterior in the universe is inferior to what is prior; i.e., reality reflects a gradation of perfections. These three suppositions appear to constitute the non-negotiable core of Neoplatonism.

12. This is the list compiled by Gilles Deleuze, *Bergsonism*, p. 21.
13. Bergson explains that he must reject both mechanism and teleology in several of his works, but most lucidly in *Creative Evolution*, chapters 1 and 4.
14. See the quotations by Inge which I select to conclude this article.
15. See VI, 9 (9), chapters 4–9.
16. VI, 9 (9), chapters 4, 5, and 7. Also see VI, 7 (38), chapters 13, 17, 18, 37, and 40.
17. See V, 9 (5), chapters 4 and 5.
18. VI, 9 (9), chapters 9 through 11; also VI, 8 (39), 13.

19. Bergson seems himself somewhat undecided about the status of science. At times he speaks as though science is just a fiction that imposes arbitrary constructs on reality; at other times he says that science makes distinctions that have a foundation in reality. He says in some places that he does not want to depreciate science; at other places he seems to regard science as misleading, a betrayal of intuition and metaphysics. This inconsistency, whether apparent or real, makes Bergson a challenge to his interpreters.
20. So it is expressed, for example, in VI, 9 (9), chapter 3.

# **The Ascent of Soul to Noûs: Charles S. Peirce as Neoplatonist**

**Kelly Parker**

To Real Being we go back, all that we have and are...(*Enn.* VI 5 [23] 7)

If there is one project definitive of recent Western philosophy, it may be the search for an alternative to the materialistic metaphysics that has come to prominence with the rise of science. While some insist that the *end* of metaphysics is the only valid alternative, others call instead for a thorough reconstruction of metaphysics. Such a reconstructed metaphysics must both accommodate the insights of modern science and account for the deeply felt sense that non-material mind or spirit is a real aspect of the cosmos.

The task of reconstructing metaphysics along these lines is enormous. There are only two directions in which to look for the kind of insights that will guide such a project: we may look outside the West to other religious and philosophical traditions, or we may look back into the West to religious and philosophical thought that has been eclipsed by materialism. This last approach inevitably brings one to examine Neoplatonic thought. The question arises, though, how Neoplatonism can accord with modern science. The work of the American philosopher Charles S. Peirce (1839–1914) may be seen in part as an attempt to place the enterprise of modern science into a philosophical framework that is properly (though not exhaustively) described as Neoplatonic.

Part I of this paper traces lines of possible Neoplatonic influences on Peirce's thought. Though there are no obvious direct influences, there are sufficient indirect connections to justify a reading of Peirce as a modern Neoplatonic philosopher. Part II presents some "Neoplatonic" features of Peirce's philosophical system. Part III elaborates these features by comparing Peirce's cosmology to that of Plotinus. Part IV identifies additional

significant similarities and differences between Peirce and Plotinus, and proposes further consideration of Peirce's philosophy as a model for "scientific Neoplatonism."

### I. Neoplatonic Influences on Peirce's Thought

At the beginning of what is probably his most "Neoplatonic" work, "The Law of Mind," published in the *Monist* in 1892, Peirce offers the following *apologia* for what he is about to spring upon his readers:

I may mention, for the benefit of those who are curious in studying mental biographies, that I was born and reared in the neighborhood of Concord—I mean in Cambridge—at the time when Emerson, Hedge, and their friends were disseminating the ideas that they had caught from Schelling, and Schelling from Plotinus, from Boehm, or from God knows what minds stricken with the monstrous mysticism of the East. But the atmosphere of Cambridge held many an antiseptic against Concord transcendentalism; and I am not conscious of having contracted any of that virus. Nevertheless, it is probable that some cultured bacilli, some benignant form of the disease was implanted in my soul, unawares, and that now, after long incubation, it comes to the surface, modified by mathematical conceptions and by training in physical investigations. (CP 6.102)

Peirce's disparaging tone in this passage offers a hard beginning to our search for Neoplatonic sources in his thought. This is amplified by the fact that the index of the eight volume *Collected Papers* reveals no other places where he refers to Plotinus by name. Likewise, a search of Peirce's unpublished papers turned up no signs of direct Plotinian influence.

The late Max Fisch, whose word on these matters is nearly infallible, writes only that the influence of Plotinus and other Neoplatonists on Peirce's mature philosophy is "largely indirect" (Fisch 241-42). Indirect influences can be as powerful as direct ones, of course, and my position is that "some benignant form" of Neoplatonism did animate his work. Peirce devoted most of sixty years to articulating a system of knowledge, based on a rigorous logic and methodology of inquiry, that would encompass all that is humanly knowable about reality. The capstone of his system—and

in his estimation, the highest ambition of the human mind—is a metaphysic and religious philosophy that reconciles the spirit of modern science with the spirit of ancient philosophy. In evaluating his own relationship to the tradition, Peirce characterized Aristotelianism as "a special development" of Platonic philosophy, and counted himself "an Aristotelian of the scholastic wing, approaching Scotism, but going much further in the direction of scholastic realism" (CP 5.77n1).

This reminds us that what appears as a Neoplatonic influence on Peirce may as easily be the result of influences common to Peirce and Neoplatonism. Indeed, Peirce was a careful student of the works that shaped Neoplatonism. He asserts that by 1894 he had "read and thought more about Aristotle than about any other man" (MS 1604, quoted in Fisch 240). He later turned to the serious study of Plato—a study he began by copying the Greek texts of key dialogues into notebooks and making his own interlinear translations. He came to consider the *Parmenides* and the *Theaetetus* as Plato's greatest works, and went so far as to reconstruct the chronology of the dialogues in the course of a survey of ethical concepts. This exercise notably shaped Peirce's conception of the *summum bonum*, the Good that defines the *telos* of all activity in the cosmos (Fisch 240-41). Peirce also investigated Pythagoras' life as a test case for his own logic of drawing history from ancient documents (MSS 476, 1277-78, 1582), and characterized Pythagoras' as "the sublimest of all human biographies" (Fisch 239). On the other hand, Peirce's principle of *tychism* (absolute chance), which runs so strongly against Neoplatonic principles, was clearly inspired by his reflections on Aristotle and Epicurus (Fisch 231).

It must be noted that Peirce's reading of ancient philosophy was inevitably colored by the traditional interpretation of the texts, and that the traditional interpretation is itself largely Neoplatonic. This effect of the received interpretation of the ancient texts is then the first likely source of indirect Neoplatonic influence on Peirce's thought.

As for traceable Neoplatonic influences, there is an obvious line of contact that needs to be explored further. Peirce was above all a logician, and had read widely in the available Neoplatonic and Stoic sources. References to Porphyry are frequent. All such references that I have checked, however, seem confined strictly to

logical concerns, even where the originals clearly carry a metaphysical burden. Peirce would not have been incognizant of that burden, though, so we have here a second likely source of indirect influence.

Finally, Peirce was of course conversant in more recent philosophy. He knew and respected the work of such latter-day Neoplatonists as Leibniz and Herbert Spencer. They must not be overlooked as likely sources of Neoplatonic themes in Peirce's work.

I suggest that the notable similarities between the Peircean and Neoplatonic philosophies are due not primarily to particular direct or indirect Neoplatonic influences, but rather to the philosophers' similar aims, to shared ancient sources, and to the residual effects Neoplatonism had on the traditional interpretation of these sources. For these reasons it is legitimate to consider Peirce as a metaphysician and cosmologist working within the Neoplatonic tradition, though perhaps he did not do so self-consciously.

## II. Plotinian Themes in Peirce's Philosophy

The signature feature of Peirce's philosophy is his theory of three irreducible and universal categories. The categories appear in different guises depending on the area of thought under consideration. In mathematics and logic they are forms of relation; in phaneroscopy (the analysis of phenomena) they are elements of any experience; in metaphysics they are modes of being. Since these universal categories first appear in mathematics, and because they "are best defined in terms of numbers," Peirce sometimes calls them the "kainopythagorean categories" (CP 7.528). He defines the *phaneron* as "the collective total of all that is in any way or in any sense present to the mind, quite regardless of whether it corresponds to any real thing or not" (CP 1.284). All three categories are inevitably to be found in any *phaneron*. They are thus similar to the five genera or categories identified in Plato's *Sophist* (254-55), categories which Plotinus took to be the primary categories of the intelligible world (*Enn.* 6 [43] 8). The closest parallel to Peirce's categories in Plotinus is probably the identification of Being, Life, and Thought as aspects of *Noûs* (Armstrong 246).

Peirce's first attempt to identify the categories, based on the analysis of propositions, produced a list of five: Being, Quality, Relation, Representation, and Substance (W 2:49-59). Peirce shortly revised the list to three categories, on the basis that Being and Substance are the unthinkable *limits* of cognition, and hence have no meaning in thought. He also later renamed the three remaining categories as generically as possible.

*Firstness* is the monadic mode—uncaused, irrational possibility; spontaneous occurrence. *Secondness* is the dyadic mode—the brute fact that something just is, as it is, in relationship to others. *Thirdness* is the triadic mode—the meaning of a *phaneron* for a mind; the habit, law, or pattern that emerges as unifying many particular actions for an observer; the general idea that encompasses an infinite number of individuals under a class (CP 1.284-353, 5.41-119). In discussing the three categories, it is crucial to note an implicit principle that emerges in the tension of Firstness' spontaneity and Secondness' stability: the world manifests change and stasis everywhere, at all levels. The fractal images discussed in David Fideler's contribution to this volume nicely represent this interplay between Firstness and Secondness, and Peirce would likely point to the fact that we so quickly learn to look for a recurring pattern in these chaotic sets as an illustration of Thirdness in our interpretation of the images.

Peirce's pragmatism stipulates that the meaning of any idea consists in "our *concept* of what our conduct *would be* upon *conceivable* occasions" in which the idea might enter (CP 8.208). This is the definition of meaning that led him to amputate the "false categories" of Being and Substance from his list: these terms name modalities beyond the limits of relation, and hence beyond conception. With respect to Plotinus's hierarchy, Peirce would no doubt eliminate both matter and the One for the same reason. Of the Plotinian cosmos, then, *Noûs*, Soul, and Bodies would remain for Peirce's philosophical consideration. This does not necessarily imply that the One is unreal in Peirce's scheme, but perhaps only that the ineffable *is* ineffable and that discourse and thought have no dealings There: philosophy, for Peirce, is evidently a dialectical activity of the soul. Within the remaining Plotinian realms, each of Peirce's three categories would be found. The most obvious correlation, to my eyes, is in *Noûs*, where Life exemplifies Firstness, Being exemplifies Secondness, and Thought exemplifies

Thirdness. This correlation, however, is merely an illustration of how Peirce's categories relate to Plotinus' hypostases. For real insight, we turn to Peirce's own words on cosmology.

### III. Peirce and Plotinus on Cosmology

Peirce's philosophy emphasizes the principles of *continuity* and *process*. His semeiotic, or general theory of signs, is an all-purpose model of continuous process. I cannot here go into the details of Peirce's semeiotic, but will only note that in his system metaphysics and cosmology are based upon the results of logic, where logic is conceived as semeiotic. His metaphysics, for which he preferred the name *synechism*, combines logical realism with metaphysical idealism. Mind, which is not an individual thing for Peirce, "*lives, and moves, and has its being*" in the continuum of symbols (NEM 4:344). The cosmos embodies a logic that our own can only approximate, and the whole of what there is can be seen as the unfolding of an evolutionary process describable as cosmic semeiosis: "all this universe is perfused with signs, if it is not composed exclusively of signs" (CP 5.448n1). Signs are teleological. By implication, so is the universe, and Peirce ventures to state the *telos* of the universe in these terms:

The purpose of every sign is to express "fact," and by being joined with other signs, to approach as nearly as possible to determining an Interpretant which would be the *perfect Truth*, the absolute Truth, and as such...would be the very Universe. Aristotle gropes for a conception of perfection, or *entelechy*, which he never succeeds in making clear. We may adopt the word to mean the very fact, that is, the ideal sign which should be quite perfect....The entelechy of the Universe of being, then, the universe *quâ* fact, will be that Universe in its aspect as a sign, the 'Truth' of being. (NEM 4:239-40)

The universe is an argument of vast scope, whose end is not a determinate conclusion statable in a proposition (since propositions serve the higher end of *expressing* truth), but is rather the living idea that is reality. The universe is an ever-growing continuum in which thought, matter, and feeling are coming to be welded together into a harmonic state of "concrete reasonableness."

Peirce writes that "Synechism is founded on the notion that the coalescence, the becoming continuous, the becoming governed by laws, the becoming instinct with general ideas, are but phases of one and the same process of the growth of reasonableness" (CP 5.4). One might well ask why Peirce thought the cosmos is striving toward greater reasonableness. The answer is that his best hypothesis as to the origin of the cosmos indicates that it must necessarily be doing so, in the long run.

Peirce's cosmology, or "mathematical metaphysics" (CP 6.213) aims to show "how law is developed out of pure chance, irregularity, and indeterminacy" (CP 1.407). The account, outlined in the accompanying chart, unfolds as follows.

If we are to proceed in a logical and scientific manner, we must, in order to account for the whole universe, suppose an initial condition in which the whole universe was non-existent, and therefore a state of absolute nothing.

But this is not the nothing of negation....The nothing of negation is the nothing of death, which comes *second* to, or after, everything. But this pure zero is the nothing of not having been born. There is no individual thing, no compulsion, outward nor inward, no law. It is the germinal nothing, in which the whole universe is involved or foreshadowed. As such, it is absolutely undefined and unlimited possibility—boundless possibility. There is no compulsion and no law. It is boundless freedom.

Now the question arises, what necessarily resulted from that state of things? But the only sane answer is that where freedom was boundless nothing in particular necessarily resulted.

I say that nothing *necessarily* resulted from the Nothing of boundless freedom. That is, nothing according to deductive logic. But such is not the logic of freedom or possibility. The logic of freedom, or potentiality, is that it shall annul itself. For if it does not annul itself, it remains a completely idle and do-nothing potentiality; and a completely idle potentiality is annulled by its complete idleness. (CP 6.215-219)

Thus the principle that the logic of the universe is at least as sophisticated as our own—that it therefore includes retroduction or abduction, the spontaneous form of inference that initiates a stream

of inference—leads us to an account of the first stirrings of determination in the utter indeterminacy of Nothing. This is the first appearance of a mode of positive possibility, different from the mere absence of determination that characterizes the initial zero-state.

I do not mean that potentiality immediately results in actuality. Mediately perhaps it does; but what immediately resulted was that unbounded potentiality became potentiality of this or that sort—that is, of some *quality*.

Thus the zero of bare possibility, by evolutionary logic, leapt into the *unit* of some quality. (CP 6.220)

The potentiality of a quality, in Peirce's metaphysics, is analogous to the Platonic Form or Idea, in that it is a timeless, self-subsisting possibility that serves as the metaphysical ground of the world of actual existence.

The evolutionary process is, therefore, not a mere evolution of the *existing* universe, but rather a process by which the very Platonic forms themselves have become or are becoming developed. (CP 6.194)

Peirce says that the very earliest stages of cosmological evolution are characterized by extreme vagueness of form (CP 6.191). Our hypothetical single, spontaneously emerging qualitative possibility is not sharp-edged; the process of determination as yet consists only in a lone arbitrary determination within the zero-state. This is the possibility of a quality, indeed, but a quality that is not distinct from any other qualities: it thus brings a whole *continuum* of immediately connected possible qualities into being. The process has to unfold further before qualities can meaningfully be considered distinct.

[W]e must not assume that the qualities arose separate and came into relation afterward. It was just the reverse. The general indefinite potentiality became limited and heterogeneous. (CP 6.199)

The evolution of forms begins or, at any rate, has for an early stage of it, a vague potentiality; and that either is or is followed by a continuum of forms having a multitude of dimensions too great for

the individual dimensions to be distinct. It must be by a contraction of the vagueness of that potentiality of everything in general, but of nothing in particular, that the world of forms comes about. (CP 6.196)

With the emergence of the continuum of positive possibility, the first of the three "universes of experience," the Universe of Ideas or Possibility, is established (CP 6.455).

There is, however, an element of Secondness in the emergence of the continuum of forms where there was only indefinite nothingness before, and an element of Thirdness in the continuity and eternal subsistence of those forms. As the evolution continues, Secondness comes to the fore. Nascent relations of identity and difference emerge in and among parts of the continuum of forms, and qualities thereby come to be differentiated.

The *second* element we have to assume is that there could be accidental reactions between those qualities. The qualities themselves are mere eternal possibilities. But these reactions we must think of as *events*. Not that *Time* was. But still, they had all the here-and-nowness of events. (CP 6.200)

The next milestone in the evolution of the cosmos is the appearance of enduring existence, the Universe of Brute Actuality of things and facts (CP 6.455). The evolutionary shift from the first universe to the second, however, is not abrupt: what Peirce is describing is a continuous process of beginning. The designation of the different universes only indicates stages in the process. As the development of relations progresses, through several stages of evolution by chance occurrence, time and space emerge.

Out of the womb of indeterminacy we must say that there would have come something, by the principle of Firstness, which we may call a flash. Then by the principle of habit there would have been a second flash. Though time would not yet have been, this second flash was in some sense after the first, because resulting from it. Then there would have come other successions ever more and more closely connected, the habits and the tendency to take them ever strengthening themselves, until the events would have been bound together into something like a continuous flow. (CP 1.412)

This continuous "quasi-flow" represents the headwaters of the almost perfectly continuous temporal stream that we experience.

The quasi-flow which would result would, however, differ essentially from time in this respect, that it would not necessarily be in a single stream. Different flashes might start different streams, between which there should be no relations of contemporaneity or succession. So one stream might branch into two, or two might coalesce. But the further result of habit would inevitably be to separate utterly those that were long separated, and to make those which presented frequent common points coalesce into perfect union. Those that were completely separated would be so many different worlds which would know nothing of one another; so that the effect would be just what we actually observe. (CP 1.412)

Space develops in a similar fashion, through the spontaneous occurrence of pairs of events that tend to become ever more regular under the influence of the principle of habit. Substance, the distinguishing feature of an enduring thing, develops out of the establishment of habits within such pairings.

Pairs of states will also begin to take habits, and thus each state having different habits with reference to the different other states will give rise to bundles of habits, which will be substances. Some of these states will chance to take habits of persistency, and will get to be less and less liable to disappear; while those that fail to take such habits will fall out of existence. Thus substances will get to be permanent. (CP 1.414)

In the nascent time and space, then, organized bundles of habits come to embody particular qualities that are distinguishable from other bundles of habits embodying other qualities. Those bundles of habits that tend to persist, which happen to acquire the habit of enduring, come to dominate the universe in the form of existing things or actualities. Thus the cosmos develops into a state where Secondness predominates, and this Peirce calls the Universe of Actuality (CP 6.455).

Peirce next turns to the principle of habit-taking, and its most dramatic effect on the evolving cosmos:

all things have a tendency to take habits....[For] every conceivable real object, there is a greater probability of acting as on a former like

occasion than otherwise. This tendency itself constitutes a regularity, and is continually on the increase....It is a generalizing tendency; it causes actions in the future to follow some generalizations of past actions; and this tendency itself is something capable of similar generalizations; and thus, it is self-generative. (CP 1.409)

The principle of habit-taking, operative but feeble in the first two stages of cosmic evolution, begins to come to prominence once actuality is well established. Actuality is characterized by reactions among enduring things. The character of such things, and consequently the relations and modes of interaction among them, would be extremely irregular at first. The principle of habit-taking has the effect of making events in the Universe of Actuality more stable and regular. It underlies the emergence of permanent substances, as we have seen. Beyond this, it has the effect of stabilizing the kinds of reaction which tend to occur among different substances. Nothing *forces* there to be a tendency toward regularity in the Universe of Actuality, for the notion of force implies necessity, an advanced variety of the regularity we are trying to explain (CP 1.407). Regularity, like possibility and particularity, must appear in the evolving cosmos by chance. But just as we have seen the tendency to take habits operate on Firstness to establish the Universe of Ideas and on Secondness to establish the universe of Actuality, so does it operate on Thirdness, on itself, to establish a universe dominated by Thirdness, lawfulness, order, and reasonableness.

The element of habit-taking has a peculiarity about it: it is the only possibility that, once occurring, "can grow by its own virtue" (CP 6.101). Thus it operates in the respective universes with increasing efficiency. In the Universe of Actuality it serves to establish regularity in the various substances, both in their internal nature and in their external relations to one another. It gives rise, in short, to the regularities we recognize as the laws of nature. According to Peirce's cosmology, "each law of nature would consist in some permanence, such as the permanence of mass, momentum, and energy. In this respect, the theory suits the facts admirably" (CP 1.415). As the principle of habit-taking operates to promulgate its own influence, events in the actual world become more regular, more predictable. *Necessity*—as embodied, for example, in the idea of necessary connection which Hume rightly said is absent from the observable realm of existent

things—emerges in the form of laws that govern events. Necessity is the support of actuality by reason, the generalization of the particular events in the Universe of Actuality (MS 277, p. 123).

As law takes hold, the evolving cosmos can be seen wending its way toward a Universe of Necessity, in which law would be perfect. This Universe is the completely reasonable state of things that is identified (in Peirce's esthetics) as an ideal. This universe is on the one hand unrealizable in principle, since it would imply the complete eclipse of Possibility and Haecceity, which are as fundamental as Necessity; on the other hand, it is the regulative ideal toward which self-controlled thought and action aim. The increase of reasonable thought and action, in the context of all three universes, is accordingly the *summum bonum* in Peirce's philosophy.

This rather lengthy account of Peirce's cosmology should suggest a number of things to the reader already familiar with Plotinus' account of creation. At the most general level, it is notable that Peirce, like Plotinus, sees the origin of the universe as the result of a spontaneous (i.e. uncaused) act of creation. This act of creation proceeds through stages, and both philosophers see the realm of existent bodies as an imperfect reflection of the realm of Forms that is the proper object of knowledge. Though the pregnant Nothing of the zero-state bears some affinities to the Plotinian One, there is apparently no room in Plotinus for Peirce's doctrine of *tychism*, his insistence on irrational chance as the driving force behind creation. The Plotinian One is the ground of creativity and necessity. Peirce separates these two principles. Creativity is Firstness, the generative principle, while necessity is Thirdness, the end toward which events in the universe are drawn. Given the role of indeterminacy in modern scientific explanations, it may be that Peirce's approach is to be preferred.

#### IV. Conclusion

Like Plotinus, Peirce sees the Platonic Forms as teeming and seething with life (*Enn.* VI 7 [43] 12), but for Peirce this implies that the Forms develop, evolve, and change. Peirce and Plotinus both reject the Platonic notion that the laws of nature are "laid down in advance and then applied" (Armstrong 253). Plotinus

holds that they appear fully perfected in Nature when Soul contemplates *Noûs*; Peirce sees them as imperfect, and perfecting them is itself the *telos* of the existent universe. Peirce's philosophy, moreover, banishes the One from metaphysics: there is no completed perfection with which we might in fact be (re)united. Peirce does mention belief in a God who is in and yet transcends the cosmos (CP 6.452), but except so far as its immanent manifestations are explored under other areas, this God is not a possible object of our knowledge. The *entelechy* of the universe is an ideal to be approximated through the infinite, ongoing effort of mind acting in the world we inhabit. For that reason, Peirce does not denigrate material body: the Universe of Existence is for him an indispensable positive aspect of reality, and not a flawed reflection of reality. In a problematic passage, Porphyry says that Plotinus "seemed ashamed of being in the body;" Peirce might ask just how he would ever accomplish much *without* a body.

Where Peirce and Plotinus are in sympathy, the possibilities are exciting indeed. I will mention only three such areas. First is Peirce's mathematical analysis of the continuum as an infinitely divisible plenum, in which every part has the same properties as the whole. Second is his modeling of this principle of continuity in a theory of signs, which allows us to view the universe as a process of continuous and reflexive *semeiosis*, every part of which potentially carries us a fragment of greater Truth. Finally, Peirce's related work on the mathematics of transfinite sets (work which diverged from George Cantor's in metaphysically important ways) may help resolve some difficulties in Plotinus' conception of infinity.

Peirce's account of the *summum bonum*, the disciplined development of mind toward a state of perfect order, lawfulness, and concrete reasonableness, seems almost a perfect adaptation of the Plotinian idea that Soul seeks contemplation and union with *Noûs*. The difference is that Peirce makes refinement of the process, and not its completion, the *telos* of the activity. In Peirce's philosophy, this process of deliberate and self-correcting pursuit of Truth, the ascent of soul to *Noûs*, is nothing other than scientific inquiry.

Peirce's metaphysical doctrine of *synechism* is his account of how things are with us that this progression is possible. For Peirce, we are of the same stuff as the cosmos. Not just materially, but also

at the higher level of Form: the human person, in one facet, is a symbol and hence already is a part of that elevated reality. This accords with Plotinus' doctrine that the higher part of the soul already participates in *Noûs*. This effective continuity of soul and idea, a central corollary of synechism, in fact appears capable of accommodating Plotinus's account of the efficacy of prayer and magic (CP 6.516; *Enn.* IV 4 [28] 40-41).

As we approach the close of the twentieth century, philosophy, science, and religious thought stand in need of a metaphysics and cosmology that do justice to the full human encounter with reality. This encounter includes not only our experience of the ordinary, but also our most advanced scientific inquiries and our most elevated spiritual experiences. The ancient Neoplatonic thinkers sought to express the mystery of our relation to Being itself in their accounts of the soul's journey toward higher reality. In what is here referred to as the "scientific Neoplatonism" of Peirce's metaphysics, this highest human ambition is characterized as the deliberate effort to enter into and express Truth. Peirce urges us to see that this human endeavor is commensurate with, and contributes to, the unfolding of the cosmos itself. Perhaps the account of reality we seek has been here all along, then, in the form of a Neoplatonism that has continued to develop even in the shadow of modern science—its "cultured bacilli" carried into this century by philosophers such as Charles S. Peirce.

Grand Valley State University

I wish to thank Nathan Houser of the Peirce Edition Project in Indianapolis, Indiana for his assistance in researching Peirce's unpublished manuscripts for this paper.

Peirce's Cosmology, or  
Mathematical Metaphysics

<i>Zero-State</i>	Nothingness (Absolute Indeterminacy) Unbounded Potentiality	The indeterminate is unstable
<i>Firstness</i>	Spontaneous "Flash" Emergence of Bounded Potentiality	One potential but vague quality entails a continuum of potential qualities
Universe of Possibility	Potentiality of Some Quality => Development of Forms	
<i>Secondness</i>	Emergence of Relations among Forms (e.g. Identity and Difference)	A system of relations develops among the forms, concretizes into determinacy, oppositions established
Universe of Actuality or Existence	Enduring Distinct Qualities: Substance  Temporal and Spatial Relations, Material Universe(s) Emerge	
<i>Thirdness</i>	Possibility of Regular Relations and Reactions among Existent Individuals	The possibility of order applies to its <i>own</i> possibility, and is thus self-increasing

Universe of Necessity or Reason	Laws of Nature Evolve Reason Grows, becomes Self- Controlling => Mind	
<hr/>	<hr/>	<hr/>
<hr/>	<hr/>	<hr/>
<i>End-State</i>	Perfect Reasonableness, Absolute Necessity  Unreachable Ideal serves as <i>telos</i>	<i>Summum bonum</i> is the growth toward greater order, not its attainment

## Alfred North Whitehead: Between Platonism and Neoplatonism

David Rodier

That the philosophy of Alfred North Whitehead is a variety of "Platonism" is a generally accepted commonplace. There are clear differences between Whitehead and Plato on many issues of metaphysics as Whitehead himself frequently notes. There may be some discussion about the precise sense in which Whitehead's metaphysical system is "Platonic." There is, nevertheless, a common consensus that Plato exerts more overt influence on Whitehead than any other philosopher. In this paper I shall argue that the Plato who has influenced Whitehead is a Plato interpreted along the lines of Plotinus rather than the Plato who is commonly presented in current philosophy texts. I am not arguing that Whitehead was directly influenced by Plotinus. I am, however, arguing that the reading of Plato which Whitehead presents is one which has significant similarities with the interpretation of Plato which Plotinus presents.

### I

Whitehead's frequent favorable references to Plato would seem to make it natural to refer to Whitehead's metaphysical system as "Platonic." Even a casual reader of Whitehead can not but notice the large number of references to Plato. References to modern philosophers outnumber references to Plato in *Science and the Modern World*—as might be expected from the subject matter. But a glance at the index to *Adventures of Ideas* will show that there are more entries for Plato than for any other philosopher. In fact, there are more entries for Plato in that index than there are for any topic or any other person. The tendency to regard Whitehead's philosophy as a variety of Platonism is only strengthened when we

notice the similarities between Whitehead's "Eternal Objects" and Plato's "Forms," the resemblance between the Whiteheadian God and the Platonic Demiurge, or even Whitehead's explicit references in his discussions of Creativity to the Platonic Receptacle. When writing metaphysics, Whitehead appears to follow the traditional view that Western philosophy is a series of footnotes to Plato: whatever course other twentieth-century philosophers may take, Whitehead develops his philosophy—or at least his metaphysics—in constant dialogue with Plato. But however useful it may be to characterize Whitehead's philosophy as a kind of Platonism, I fear that the degree to which that philosophy is embedded in the Platonic tradition is more obscured, rather than illuminated, by the use of the term "Platonic."

Most contemporary writers in their discussions of Whitehead's "Platonism" have in mind the interpretation of Plato which has tended to dominate late nineteenth-century and twentieth-century scholarship. This interpretation of Plato and Platonism originates, as far as the English-speaking world is concerned, in the efforts of the Arnolds and Jowett to construct a secularized Platonism to serve as the basis of an educational reform which would produce gentlemen devoted to a liberal and secularizing state. Crucial to this effort to present Plato as the patron of the liberal democratic state was the separation of Plato from his successors. Platonism needed to be constructed as a tradition without any essential religious or mystical components. But if Plato was to be interpreted this way then Plato's philosophy must be sharply distinguished from that of his immediate successors as well as from the philosophy of Plotinus and his successors who clearly developed Plato's texts into a metaphysical tradition with religious overtones and whose mysticism ranged from the rational to the theurgic.

Obviously, the motives for this separation between Plato and what were now termed the "Neoplatonists" were political rather than philological. However, this revisionist version was successful. In standard usage the term "Platonism" no longer means what it did to the Cambridge Platonists or even to Coleridge. "Platonism" no longer encompassed a continuous philosophic tradition beginning with Plato and continued by philosophers from Plotinus to Proclus and then modified by Christian, Jewish and Muslim authors. Instead "Platonism" stood for the philosophy of the Platonic dialogues interpreted in opposition to what was now termed

"Neoplatonism"—a decadent tradition which was said to have its beginning with Plotinus. Of course, E. R. Dodds in 1928 and Cornelia de Vogel again in 1959 showed that the idea that Neoplatonism was a late corruption of the platonic tradition was indefensible. Yet their work is still, I fear, not part of the common consensus. Most philosophy texts still present the Plato of the Arnolds and Jowett—a Plato who is presented as the patron of the enlightened leaders of a modern liberal democratic state. Those who do not share this nineteenth-century interpretation present not a Plato as interpreted by the Neoplatonists but rather the reactionary and totalitarian Plato of Popper and Ryle or the homophobic and misogynist Plato of the post-moderns.

So it would seem to be the case that when most scholars refer to the Whitehead's Platonism, it is, I suspect, the Platonism of the tradition stretching from Jowett to Cornford which they have in mind. I do not believe that they mean "Platonism" as the Cambridge Platonists or Coleridge would have understood the term. But if the term "Platonism" is used as distinct from, and in opposition to, the term "Neoplatonism," then it is rather misleading to refer to Whitehead's philosophy as a form of Platonism. On the one hand, Whitehead's philosophy differs in many significant ways from the philosophy discovered in Plato's *Dialogues* by the dominant Platonic interpreters of the late-nineteenth-century and twentieth-century. On the other hand, the very ways in which Whitehead's philosophy differs from this version of "Platonism" provide good reasons for referring instead to the "Neoplatonism" of Whitehead.

## II

Obviously, in this paper I can not discuss all of the differences between Neoplatonism and the Plato of the current common tradition. Similarly I cannot present a discussion of Platonic and Neoplatonic elements in all of Whitehead's published works. For the purposes of this paper I shall focus on three key differences between Neoplatonism and the current standard presentation of Plato's philosophy and I shall discuss these differences as they appear in only the last three of Whitehead's major philosophical works. Let me present a brief justification for each of these restrictions.

Even if the discussion of the differences between Neoplatonism and the standard presentation of Plato were to be limited to Classical Pagan Neoplatonic writers there would be a great variety of different opinions. For my purposes I shall limit my discussion of Neoplatonic positions to Plotinus because I feel that the differences between Plotinus and the standard version of Plato are particularly illuminating when examining Whitehead. I shall further restrict my discussion to three key issues which define the differences between Plotinus and the current standard version of Plato.

The standard versions of Plato whether nineteenth-century or post-modern see Platonism as characterized by at least three themes:

- (1) a metaphysical dualism—especially a dualism of soul and body;
- (2) a devaluation of physical existence—the physical world is a prison for the soul and is characterized by imperfection, flux a genesis which is fundamentally a lack of being, a world only of becoming;
- (3) an almost childish use of the myth of the Demiurge to explain the physical world order—a Demiurge which is too much like the Creator God of the Bible and one who lacks the philosophic sublimity of Aristotle's Unmoved Mover.

In radical contrast to these three themes are the following positions which are characteristic of Plotinus' reading of Plato:

- (1) the denial of a radical dualistic opposition between body and soul;
- (2) a rejection of any attempt to devalue the physical world and the especially the belief that the physical world is perfect after its kind and not merely a deceptive prison for the soul;
- (3) the perfection of the world is not the result of the conscious purpose of a Creator God who is distinct from the physical world rather it is the result of the world's reflecting the order of the world of the forms.

Each of these characteristically Plotinian themes can be found in Plato's *Dialogues*. However, although each of them are present in

the *Dialogues*, each theme is frequently marginalized in the standard twentieth-century presentations of Platonism. The thesis of my paper is that each of these Plotinian themes is characteristic of Whitehead's philosophy as he presents it in his major works from *Process and Philosophy* through *Adventures of Ideas* and *Modes of Thought*. For this reason I hold that it is perhaps more appropriate to refer to Whitehead's "Neoplatonism" than his "Platonism" when trying to characterize his philosophy.

Just as a full consideration of the relationship between a narrowly defined Platonism and Neoplatonism is obviously beyond the compass of a short paper, so also is a discussion of Neoplatonic elements in all Whitehead's works. Many interesting questions might be raised about Platonic and Neoplatonic elements in Whitehead's accounts of logic and mathematics. However, rather than attempting the ambitious project of discussing Whitehead's affinity for the Neoplatonic tradition throughout his intellectual career, I shall limit my discussion here to the issue of the affinity between Neoplatonism and Whitehead's metaphysics in the major works he produced after he came to Harvard. And just as I have limited my discussion Neoplatonism to three key points in the philosophy of Plotinus, I shall focus my discussion of Whitehead on Whitehead's last three major philosophical works. These are: *Process and Reality*, *Adventures of Ideas*, and *Modes of Thought*.

Whitehead regarded *Process and Reality* and *Adventures of Ideas*, together with the earlier *Science and the Modern World*, as presenting a single philosophic point of view:

The three books—*Science and the Modern World*, *Process and Reality*, *Adventures of Ideas*—are an endeavor to express a way of understanding the nature of things, and to point out how that way of understanding is illustrated by a survey of the mutations of human experience. Each book can be read separately; but they supplement each other's omissions and compression. (AI vii)

In discussion of Whitehead's metaphysics both *Adventures of Ideas* and *Modes of Thought* are often neglected in favor of a discussion based almost exclusively on *Process and Reality*. For my purposes these latter two works need to be included. There are two reasons for this. First, the subject matter of both *Adventures of Ideas* and *Modes of Thought* provides Whitehead with the opportunity for a more explicit discussion of Plato than the more technical *Process*

*and Reality*. Secondly, just as it is realized that *Process and Reality* does not just supplement, but radically transforms the vision of *Science and The Modern World*, by giving it a very precise metaphysical framework, so, I think, it can be said that *Adventures of Ideas*, although recapitulating and presupposing much of the conceptual framework of *Process and Reality*, manages subtly to change the system, even if in only nuances. I would further argue that these nuanced modifications become even more significant in *Modes of Thought*—a work which occupied Whitehead for the five years succeeding the publication of *Adventures of Ideas*. For the same reasons I shall exclude reference to *Science and the Modern World* from my discussion since the subject matter of *Science and the Modern World* gives Whitehead little opportunity directly to comment on Plato.

### III

Plotinus does not claim to be presenting a new philosophic position. He claims only to be interpreting the philosophy of Plato. For this reason it would be expected that he would adhere to some variety of Platonic dualism; especially since such a dualism is quite characteristic of his Middle Platonic predecessors. There are similar a priori reasons for expecting Whitehead to hold to a version of Platonic dualism, especially if such a dualism really is characteristic of Plato's philosophy. Even if it were not the case that Whitehead develops his positions in constant dialogue with Plato he is, in any case, like most modern philosophers, also the heir of a radical Cartesian mind-body dualism. In the light of these facts it seems quite remarkable that both Whitehead and Plotinus reject the radical dualism of soul and body which is found in some of Plato's middle *Dialogues*—the very dualism which is thought to be the most characteristic of Plato's metaphysics.

What is even more remarkable is the fact that the reasons for Whitehead's and Plotinus' rejection of this dualism are based in both cases on a metaphysics which makes the dualism impossible. Further both philosophers not only reject the metaphysical dualism of soul and body, they also reject the valuational attitude which underlies that metaphysical dualism. In this section I shall only consider the first point, i.e., the metaphysical basis for Plotinus'

and Whitehead's rejection of Platonic dualism. I shall postpone a consideration of their rejection of the body/prison view of the world until the next section.

The rejection of the dualism of body and soul found in such middle Platonic dialogues as the *Phaedo* or the *Republic* is fundamental to the metaphysics of Plotinus. For Plato there is a fundamental duality between the eternal World of the Forms and the ever-changing physical world. This metaphysical opposition between the Forms and the physical world leads to the further dualism of the soul which has a likeness to the Forms but is trapped in the prison of the body. In contrast to this view, Plotinus sees reality as composed of three ontological levels: The One, Intellect, and Soul. Each of these is the ontological ground of its successor and each successor, although distinct, is never completely separated from its prior. Since none of the three hypostases is ontologically independent of its prior, there can be no dualism in the sense of ontological opposition between the levels of reality in the Plotinian scheme of things. In the light of his ontological commitments, no matter how much he attempts to use Plato's language, Plotinus never can affirm the dualism of soul and body the way that his Platonic predecessors do.

There are two basic reasons why Plotinus rejects both theses of Platonic dualism. These two theses, once again, are: (1) the concept that the soul and the body are distinct and independent kinds of things and (2) the concept that the soul is imprisoned in the body. Plotinus' two reasons for rejecting the theses are: (1) there is no body apart from soul; and (2) soul is never, properly speaking, in the body. Let us consider both of Plotinus' reasons in more detail.

First, although Plotinus insists that there is a radical distinction between soul and body, in his scheme of things the physical world is not a separate reality which can exist apart from soul. Rather the physical world is the lowest manifestation of Soul as an ontological principle. Soul is not dependent for its existence on body but every body depends for its existence on the presence of a soul. No body exists apart from soul—or as Plotinus would prefer to say—without the soul's being present to it...All physical objects are the product of soul's contemplation:

If body did not exist, soul would not go forth, since there is no place other than body where it is natural for it to be. But if it intends to go

forth, it will produce a place for itself, and so a body. Soul's rest is, we may say, confirmed in absolute rest; a great light shines from it, and at the outermost edge of this firelight there is a darkness. Soul sees this darkness and informs it, since it is there as a substrate for form. For it was not lawful for that which borders on soul to be without its share of formative principle, as far as that was capable of receiving it. (IV.3.9.21-27)<sup>1</sup>

The second reason is that the soul is never contained and limited by the body. "For every soul has something of what is below, in the direction of the body, and what is above, in the direction of Intellect" (IV.8.8.13-15). This two-fold direction of vision is especially clear in the case of the World Soul:

And just as the intellectual way of outgoing is a descent to the lower limit of that which is worse [than Intellect]—for it is not possible for it to go up to that which transcends it; but it must, acting outwards from itself and unable to remain on its own, by the necessity and law of nature arrive at soul; for this is its goal, and it must hand over what comes after to soul and run up again itself—so is the activity of soul; what comes after it is this world and what is before it is the contemplation of real being; this kind of experience comes slowly to partial souls, when they are in the worse and a turn takes place to the better, but that which is called the Soul of the All has not become engaged in the worse kind of work and, having no experience of evils, considers what lies below it contemplatively and remains attached to the realities before it for ever. (IV.8.7.18-30)

Plotinus' rejection of the view of the body as a prison for the soul becomes evident in two images which he uses to express the relationship between soul (in this case the World Soul) and body. These two images are of a net in the sea and of a builder living in a house which he has made. The first image—that of the universe as a net immersed in the sea which represents soul—is used to emphasize the point that the body neither possesses nor contains the soul:

...it [sc. body] is mastered, not the master, possessed not possessor. The universe lies in soul which bears it up, and nothing is without a share of soul. It is as if a net immersed in the waters was alive, but unable to make its own that in which it is. The sea is already spread out and the net spreads with it, as far as it can; for no one of its parts can be anywhere else than where it lies. And soul's nature is so great, just because it has no size, as to contain the whole of body in one and the same grasp; wherever body extends, there soul is. If body did not exist, it would make no difference to soul as regards size; for it is what it is. The universe extends as far as soul goes; its limit of extension is the point to which in going forth it has soul to keep it in being. The shadow is as large as the rational formative principle which comes from soul; and the formative principle is of such a kind as to make a size as large as the form from which it derives wants to make. (IV.3.9.36-51).

Plotinus' second image is a deliberate rejection of the Pythagorean and Platonic image of the soul in the body being like a prisoner in a prison. Plotinus opposes to the image of the world as a prison the image of "a beautiful and richly various house":

There came into being something like a beautiful and richly various house which was not cut off from its builder, but he did not give it a share in himself either; he considered it all, everywhere, worth a care which conduces to its very being and excellence (as far as it can participate in being) but does him no harm in his presiding over it, for he rules it while abiding above; it has a soul which does not belong to it, but is present to it. (IV.3.9.29-36)

The crucial point in this image is that the builder is living in the house and caring for it, but he is both superior to it and not trapped in it. The builder cares for the house but it, "does him no harm in his presiding over it, for he rules it while abiding above."

This same insistence that the soul is not "of the body" but "to the body," i.e., that the soul is not the possession of, but the possessor of the body is as true of the individual souls as it is of the Plotinian World Soul. Plotinus' basic position of the relationship between the individual souls of living things and their bodies is well stated in a passage from the quotation preserved by Elias and appended by Henry and Schweitzer in their edition to the text of *Enneads* 1.9:

<sup>1</sup>All quotations from Plotinus are from the translation by A. H. Armstrong printed in the Loeb edition of the *Enneads*.

...so the philosopher must imitate God and the sun and not neglect his body altogether in caring for his soul, but take thought for it in the appropriate way till it becomes unfit and separates itself from its community with the soul (trans. Armstrong, loc. cit. p. 325).

But since the passages I have quoted so far have concentrated on the World Soul it is necessary briefly to show why Plotinus would think that the same arguments should apply to the relationship between the individual souls of living things and their individual bodies.

It is certainly true that in many passages in the *Enneads* it is not clear whether Plotinus is speaking of the individual souls or the World Soul. At times it may even seem that at times Plotinus is not quite clear conceptually whether a reference to the World Soul or a reference to the individual soul is required by his argument. It is also the case the relationship between the individual souls and the World Soul is a particularly complex one for Plotinus. He certainly wants to assign moral responsibility to the individual souls, but at the same time he wants to assert that not only are the individual souls "parts" of the World Soul but that their partition is not a kind of separation. The individual souls are divisions of the World Soul the same way that the soul is divided among the organs and parts of the body: "...for that of it which is divided is indivisibly divided. For it gives itself whole to the whole and is divided in that it is present in every part (IV.1.19-23)". Plotinus is quite clear that the souls of individual beings are not separate from the World Soul.

Plotinus is one of the few Classical or mediaeval philosophers to whom the terms "monopsychist" literally applies. Plotinus holds to a strict ontological unity of all the individual souls. He accepts the common position in classical philosophy that there is a single sensitive soul in the sentient being. But he notes that this implies a certain partibility of the soul. The soul is present in its entirety at any point in the body of the organism and is not divided by being so present. Since the particular souls of individual living things are not divided among the various parts of the body, there would not seem to be any difficulty in assuming that the World Soul unifies the universe and is equally present in each part of the universe. In this case it would seem reasonable to argue that the alleged individual souls of different living beings are merely parts of the

World Soul and parts not in the sense of having a common origin—as the *Timaeus* myth might imply—but parts in the sense that they are ontologically one with the World Soul.

Is it true that, just as we maintain that the soul of each individual is one because it is present as a whole at every point of the body, and is really one in this way, not having one part of it here and another there in the body...so in the same way my soul and your soul are one, and all souls are one?...Now if my soul and your soul come from the soul of the All, and that soul is one, these souls also must be one (IV.9.1.1-14).

Obviously this claim that all souls are one seems to contradict our experience of the privacy of such various states of soul as feelings, desires and virtues. The claim that all individual souls are one would seem to entail that the desire felt by a given soul would be felt by all other souls. But this is patently not the case. To this objection Plotinus give the following response:

First of all, then, it is not true that, if my soul and someone else's are one soul, just for that reason my composite [of body and soul] is the same as his composite. For when something which is the same is both in one thing and in another it will not have the same experiences in each of them, as for instance the [form of] the human being in me when I am in motion: the form in me in motion and in you not in motion will be in motion in me and stationary in you; and there is nothing absurd, nothing really disconcerting about the same thing being in me and in you: it is certainly not necessary that when I have a perception the other also should have exactly the same experience. For even in one body one hand does not perceive what happens to the other but the soul in the whole body. (IV.9.2.1-10)

Plotinus' point seems to be that the unity of the individual souls of living beings in the universe does not imply an identity of either passions or desires, since these are the result of the specific body which is present to the soul at that location. The unity of souls is rather the kind of unity which the various parts of an organism possess by virtue of being members of a single living being. This unity of the individual souls is an ontological unity which is both a unity of origin (since all souls derive from the World Soul) and a unity of Activity (since the individual souls are all acts of Soul). Because the individual souls never are completely separated from

their ground, they can not be imprisoned in the body. In fact Plotinus prefers not to speak of the individual souls as separate entities. His preferred metaphor is to speak of the individual souls as radii of a circle. They remain connected to a central point but they also touch the circumference. The body does not contain and imprison the soul for only a part of the soul attends to the body. The other part of the soul is joined to the World Soul. As such it always looks upwards to the Intellect:

'from the indivisible and that which is divisible in the sphere of bodies' is equivalent to saying that soul is composed of the part which is above and that which is attached to that higher world but has flowed out as far as these parts, like a line from a center. But when it has come here in this part, see how in this way it preserves in the very part the nature of the whole (IV.1.14-18).

It seems that Plotinus even obliquely hints that his teaching on this point conflicts with the usual interpretation of Plato, "And, if one ought to dare to express one's own view more clearly, contradicting the opinions of others..." He continues,

even our own soul does not altogether come down, but there is always something of it in the intelligible; but if the part which is in the world of sense-perception gets control, or rather if it is itself brought under control, and thrown into confusion [by the body], it prevents us from perceiving the things which the upper part of the soul contemplates. (IV.8.8.1-6).

Plotinus is prepared to admit that some souls may completely immerse themselves in the physical world and fail to turn their gaze upwards. But even for these souls the return is always possible because no soul ever completely descends into the physical world: "...the whole [of the soul] does not depart, but there is something of it which did not descend" (IV.1.1. 12-13). Or, as he says in ending his discussion on the "Descent of the Soul" (*Enneads* IV.8):

But the souls which are partial and of a part have also the transcendent element, but they are occupied with sense-perception, and by their [lower] faculty of conscious apprehension they apprehend many things which are contrary to their nature and grieve and trouble them, since what they care for is a part and defective, and has a great many alien and hostile things around it, and a great many

which it desires; and it has pleasures, and pleasure deceives it; but there is a higher part which the transitory pleasures do not please, and its life is conformable [to its nature] (IV.8.8.17-24).

As we shall see shortly, Plotinus' account of a soul which simultaneously looks downward to preside over the physical world and looks upwards to the Nous bears a striking resemblance to Whitehead's account of actual entities as having a physical and a mental pole. And so it is to Whitehead's account of the actual occasion as a unity of the physical and the mental poles that I shall now turn.

That Whitehead rejects any form of dualism is obvious to even a casual reader. Given that general rejection of dualism, the point that Whitehead's position is better characterized by the Plotinian continuity of body and soul than by a Platonic dualism of body and soul is easy to establish.

This is not to say that the two metaphysical structures are identical. Of course there are striking differences between the two accounts. Whitehead has completely eliminated the traces of the Platonic dualism which Plotinus continues to accept. Whitehead refuses to accept a definition of the soul, or the mental, as a different kind of thing from the physical. He might also be said to reject Plotinus' account of the higher and lower parts of the soul, although he is quite prepared to have a range of greater or lesser degrees of consciousness among his actual occasions. Nevertheless, Whitehead's account of the structure of actual entities seems to have more in common with Plotinus' account of the relationship between soul and body than it does with the radical dualism implicit in Plato's soul in prison metaphor.

Whitehead's ultimate metaphysical units—the actual entities—each have in their process of coming to be a physical and a mental pole. In *Process and Reality* Whitehead states:

...no actual entity is devoid of either pole; though their relative importance differs in different actual entities...an actual entity is essentially dipolar, with its physical and mental poles; and even the physical world can not be properly understood without reference to its other side, which is the complex of mental operations. (366)

This complete identity of the self both with the body and with the mind is further developed in the following passage:

Thus our experience in the present discloses its own nature as with two sources of derivation, namely, the body and the antecedent experiential functionings. Also there is a claim for identification with each of these sources. The body is mine, and the antecedent experience is mine. Still more, there is only one ego, to claim the body and to claim the stream of experience. I submit that we have here the fundamental basic persuasion on which we found the whole practice of our existence. While we exist body and soul are inescapable elements in our being, each with the full reality of our own immediate self. (MT 220-221)

Not only is Whitehead's concept of the unity of the actual entity which has a physical and a mental pole similar to Plotinus' denial of any soulless body, but in this passage even his language is remarkable similar to Plotinus' description of the soul as equally present in the whole of the body: the soul contains, "the whole of body in one grasp; wherever body extends, there soul is" (IV.3.9.43-44).

#### IV

As I said earlier both Plotinus and Whitehead not only reject the Platonic image of the soul imprisoned in the body because they reject its dualistic presuppositions, they also both reject the world-despising attitude implicit in the image. There are those who seem to interpret Plotinus' mysticism as world-renouncing and essentially of a piece with various neo-Pythagorean and Gnostic schools which flourished in the third century. But such a view is mistaken. Instead of viewing the physical world as either evil or as the creation of a less than perfect being, an intense and principled opposition to any form of Gnostic belief is the hallmark of Plotinus' philosophy. However mystical the philosophy of Plotinus may be, his mysticism never allows him to disparage the physical universe. As A. H. Armstrong has observed. "When Plotinus is looking at the material world as a whole, from the point of view of soul, he regards it as an ensouled organic unity, *good and necessary as a whole and in every part*" (86 italics added).

In opposition to the Gnostics' devaluing of the physical world Plotinus claims that the physical world is good after its kind. It is not the world of the forms and it is, by necessity, inferior to the

world of the Forms. But this ontological inferiority does not entail that it lacks its own degree of perfection:

The greatest beauty in the world of sense, therefore, is a manifestation of the noblest among the intelligibles, of their power and of their goodness, and all things are held together for ever, those which exist intelligibly and those which exist perceptibly, the intelligibles existing of themselves and the things perceived by sense receiving their existence for ever by participation in them, imitating the intelligible nature as far as they can. (IV.8.6.23-29)

It might seem unlikely that Whitehead in the twentieth-century should have to oppose anything like world devaluing Gnosticism. However, Whitehead realized that the Gnostic attitude towards the physical world was a continuing option even for modern man.

...in practice there has always been the temptation to abandon the immediate experience of this world as a lost cause. The shadows pass—says mystical Religion. But they also recur, and recur—whispers the Experience of Mankind. Be tranquil, they will end—rejoins Religion. The mystical religion which most whole-heartedly adopts this attitude is Buddhism. In it despair of this world is conjoined with a program for the world's abolition by a mystic tranquillity. Christianity has wavered between Buddhist renunciation, and its own impracticable ideals culminating in a crude Millennium within the temporal flux. The difference between the two consists in the difference between a program for reform and a program for abolition. I hazard the prophecy that that religion will conquer which can render clear to popular understanding some eternal greatness incarnate in the passage of temporal fact (AI 33).

But while Plotinus' rejection of the Gnostic devaluation of the physical world was based on his unwavering commitment to what he understood as Hellenism, Whitehead's opposition to world-renunciation is not just a matter of his accepting the values of twentieth-century science and Enlightenment liberalism. Whitehead opposes any form of thought which posits ultimate value as existing anywhere other than in immediate experience because his philosophy recognizes as ultimately real only that which is constituted out of experience. For Whitehead the ultimately real are self-constituting occasions of experience. This rejection of any form metaphysical dualism lies at the foundation of Whitehead's

system. In the familiar Ontological Principle he enunciates this fundamental position that all reality is grounded in the world of experience: "...by the ontological principle whatever things there are in any sense of 'existence' are derived by abstraction from actual occasions" (PR 113). Or as he succinctly observes on another occasion: "Wherever a vicious dualism appears, it is by reason of mistaking an abstraction for a final concrete fact" (AI 190).

It is precisely the rejection of any devaluation of the physical world as it presents itself in our experience that is at the heart of Whitehead's insistence that all ultimately real things must be beings. Whitehead's trenchant critique of Plato's cosmology is not just a criticism of dualism in general. It is a criticism which sees any kind of dualism as ultimately leading to a devaluation of the physical world. Because of its duality between the World of the Forms as Being and the Physical World as Becoming, Whitehead regards as Plato's cosmology as the "feeblest of solutions" (AI 168). But, as the passage in *Adventures of Ideas* makes clear, Whitehead's harsh evaluation arises from his seeing that such a dualism must reduce the physical world to a mere imitation of the truly valuable. Such a dualism entails that the physical world and our experiencing of the physical world be merely second-rate substitutes for Reality:

When Plato is faced with the problem of expressing the relationship of God to the World, and of the relation to the World of those Ideas which it is in God's nature to contemplate, Plato's answer is invariably framed in terms of mere dramatic imitation. When Plato turns to the World, after considering God as giving life and motion to the ideas by the inclusion of them in the divine nature, he can find only second-rate substitutes and never the originals. For Plato there is a derivative second-rate God of the World who is a mere Icon, that is to say an image. Also when he looks for the ideas, he can only find in the World, imitations. Thus the World for Plato, includes only the image of God, and imitations of his ideas, and never God and his ideas (AI 167-168).

In contrast, Whitehead argues

What metaphysics requires is a solution exhibiting the plurality of individuals as consistent with the unity of the Universe, and a solution which exhibits the World as requiring its union with God, and God as requiring his union with the World (AI 168).

Whitehead's rejection of levels of reality is thus grounded ultimately in a positive evaluation of the world. For Whitehead, "Truth and Beauty are the great regulative properties in virtue of which Appearance justifies itself to the immediate decision of the experient subject" (AI 241). But the value present in the world is no mere appearance as opposed to some unchanging reality: "The temporal world is the stage of finite accomplishment" (AI 172). In language remarkably like that of Plotinus Whitehead refers to "that element in perishing lives which is undying by reason of its expression of perfections proper to our finite natures" (AI 172).

## V

My third point of contrast between the standard version of Plato and Plotinus is the contrast of a Platonic account of the world either in terms of the divine Eros of the *Symposium* and *Phaedrus* or the Demiurge of the *Timaeus* and Plotinus' insistence that the physical world is not the result of conscious design. On this point at least the standard interpretation does seem to be more true to the entire tendency of the *Dialogues* than Plotinus. Even if we hold that Plato realized that any attempt to speak of the origin of the universe must involve mythic language, even if we treat the accounts of the *Timaeus*, *Phaedrus* and *Symposium* as myths which should not be read too literally, an underlying point seems to remain when all allowances for myth are taken into account. That point is that Plato does hold that the dynamic nature of the physical world in contradistinction to the eternal fixity of the realm of the Forms demands that any adequate account of the physical world be teleological. And that teleology be the result of conscious design. That this is the correct interpretation of the core philosophic content of the myths of the *Timaeus* and other middle dialogues is confirmed by Plato's account of the cosmos in the *Laws X*. There Plato seems not to be appealing to myth when he speaks of the order of the universe being due to the guidance of a Good Soul.

A rather literal reading of the Platonic text seems to have dominated middle platonic writers. In fact the middle Platonists even read the Platonic myths as literal metaphysical accounts and developed the concept of a "second God" who ordered the cosmos. Plotinus emphatically opposed this reading of Plato. Instead of a

Providence ordering the universe, he insisted on the doctrine of "untroubled causation." For Plotinus the appropriate model for creative activity is not that of a craftsman's purposive making something, but rather the model of contemplation. He dismisses the position that, "it is necessary that the intelligence which is in the All should have calculations and memories" as "a statement of men who assume that unintelligence is intelligence, and have come to the conclusion that to seek to be intelligent is the same thing as to be intelligent" (IV.4.12.2-6). He continues:

For what else could calculation be but the effort to find intelligence and reason which is true and attains to the truly existent? For the man who calculates is like one who is playing the lyre to acquire the art of lyre-playing or who is practising to acquire habitual proficiency, or in general like one who is learning in order to know. For the man who is calculating seeks to learn that which if someone already possesses, he is intelligent: so that intelligence is in one who has come to rest.... If then we are going to put the ruling principle of the universe into the class of learners, we should attribute to it calculations and perplexities and memories which are proper to one who compares the past with the present and the future. But if we are going to class it as a knower, we must consider that its knowing is in a repose which reached its term (IV.4.12.6-23).

Plotinus emphasizes the distinction between the universe as produced by contemplation (*theorein*) and the universe as produced by action (*poiein*):

And if anyone were to ask nature why it makes, if it cared to hear and answer the questioner it would say: "You ought not to ask but to understand in silence, you too, just as I am silent and not in the habit of talking. Understand what, then? That what comes into being is what I see in my silence, an object of contemplation, and that I, originating from this sort of contemplation have a contemplative nature. And my act of contemplation makes what it contemplates, as the geometers draw their figures while they contemplate. But I do not draw, but as I contemplate, the lines which bound bodies come to be as if they fell from my contemplation." (III.8.4.1-11)

Surely A. H. Armstrong is correct in his footnote to his translation of this passage: "...the intuitive spontaneity of the process here, as contrasted with the careful and deliberate mathematical planning

in Plato's symbolical description [in the *Timaeus*], brings out clearly an important difference in the mentality of the two philosophers."

The way that Plotinus avoids any reference to purpose or intention in his account of the origin of the physical world is vividly illustrated by the image of the house and the builder which was discussed in section 3 above. There we noted how Plotinus discussed the relation of the soul and the body in terms of the body's being a beautiful house which was taken care of by its builder (the soul) rather than the body's being a prison to which the soul is confined. Here we should note that in using his image of "a beautiful and richly various house" Plotinus carefully avoids any references to the house's being made by the builder. Instead of saying that someone built or made the house, Plotinus—in rather tortuous language—states that "something like a house came into being [*γενόμενος*]" (IV.3.9.29). Even when his image would naturally call for purposive language, Plotinus' insistence that the creation and governance of the universe does not involve intentional activity is so strong that he avoids even the appropriate language demanded by his image.

Whitehead differs sharply from Plotinus in his proposed correction of Plato's concept of a creator and orderer of the physical world. Unlike Plotinus, Whitehead is not troubled by the fact that Plato's Craftsman is not perfect. Despite his strictures on Plato's cosmology quoted earlier, it is precisely the Platonic Eros and Plato's vision of the Creator not as static perfection but as a Craftsman constantly shaping the world which appealed to Whitehead. Whitehead even is willing to allow the Demiurge to have an ideal vision which he attempts to elicit from the materials of the physical world. What Whitehead finds intolerable is Plato's occasional lapses in speaking of the creative activity in terms of will rather than in terms of persuasion and his dualism which separates God from the world. Although he emphatically rejects Plato's dualism of static Forms and ever-changing physical world, Whitehead still can find merit in Plato's idea of God urged to create by the vision of Beauty:

The religion of Plato is founded upon his conception of what a God can be, with gaze fixed upon forms of eternal beauty; and his sociology is derived from his conception of what man can be, in

virtue of a nature which for its full description requires themes applicable to the nature of gods. (AI 12)

In a similar fashion Whitehead returns repeatedly to the Platonic conception of a divine Eros as shaping the world. In the formal structure of *Process and Reality*, the Platonic Eros appears in the guise of "subjective aim"; but in the narrative structure of *Adventures of Ideas* it is undisguised:

But we have to ask whether nature does not contain within itself a tendency to be in tune, an Eros urging towards perfection (AI 251).

We must conceive the Divine Eros as the active entertainment of all ideals, with the urge to their finite realization, each in due season. Thus a process must be inherent in God's nature, whereby his infinity is acquiring realization (AI 277).

His sharpest criticisms are reserved for the concept of a "static God" whose only activity can be that of a Divine Will imposed on a radically distinct world.

The vicious separation of the flux from the permanent leads to the concept of an entirely static God, with eminent reality, in relation to an entirely fluent world, with deficient reality. But if the opposites, static and fluent, have once been so explained as separately to characterize diverse actualities, the interplay between the thing which is static and the things which are fluent involves contradiction at every step in its explanation. Such philosophies must include the notion of 'illusion' as a fundamental principle—the notion of 'mere appearance.' This is the final platonic problem (PR 516).

There are significant differences between Whitehead's God who is ever becoming and the utterly transcendent One of Plotinus. These differences arise from the radical differences between the Classical vision of the world which is based on an essentialist science and as a result ultimately sees a fixed arrangement of possibilities in the physical world even though there is disagreement as to whether the possibilities are finite or infinite and Whitehead's process philosophy which attempts to take seriously the advances of twentieth-century science. But despite the differences between Whitehead's God and Plotinus' One they share two traits which sets them apart from Plato's Demiurge. Both are

intimately in the world. Whitehead's God is fully immanent and Plotinus' One is never apart from anything which flows from it. Further, both are in an important sense infinite and that infinity is precisely the ground of the creation of the world. Plotinus would disagree with Whitehead on the nature of the process by which God's infinity is realized but he surely would echo Whitehead's words: "Thus a process must be inherent in God's nature, whereby his infinity is acquiring realization (AI 277)."

The American University

An earlier version of this paper was presented at the Twelfth International Conference of the International Society for Neoplatonic Studies in 1995. This revision has benefitted greatly from the helpful comments made at that time by Professor Lewis S. Ford of Old Dominion University and Professor Donald W. Sherburne of Vanderbilt University. Obviously neither of these well-known experts on Whitehead should be held accountable for errors of interpretation which undoubtedly still remain.

## Process and Eternity: Whitehead Contemplates Plotinus

Lewis S. Ford

Contemporary process thought diametrically opposes neo-Platonism on one fundamental point. For neo-Platonism, and for Greek thought generally, eternity is ontologically primary, time secondary. Process thought finds no way in which time can be derived from the eternal, particularly if this term "eternal" is disambiguated as meaning the atemporal or timeless, that which has no time, rather than the everlasting. (It is most surprising that the same term, "eternal" should come to mean both that which has no time and which has all time, but this is probably the result of identifying the Greek timeless deity with the everlasting God of the Bible, the One who was, and is, and is to be.)

Since process thought also opposes all forms of dualism, including the dualism of time and eternity resulting from conceiving them as having separate roots, the only possible alternative is that eternity should be derived from time. Is it so surprising that the timeless should be abstracted from time?

A complete derivation of the timeless from time, however, will require some modification of Whitehead's philosophy, particularly with respect to the primordial nature of God and the nature of eternal objects. In this regard Whitehead's philosophy represents a sort of halfway house, combining many traditional nontemporalist features with the temporalist dynamic which inspires a our endeavour to conceive of an all-inclusive temporalism. We propose to conceive time as including all being, creative power and transcendence.

Whitehead is generally considered a Platonist with respect to his forms or eternal objects. Unlike the actual entities they characterize, these forms are out of time. "The mountain [his example of actuality] endures. But when after ages it has been worn away, it has gone. If a replica arises, it is yet a new mountain.

A colour is eternal. It haunts time like a spirit. It comes and it goes. But where it comes, it is the same colour. It neither survives nor does it live. It appears when it is wanted. The mountain has to time and space a different relation from that which colour has" (SMW 86f). These eternal objects are like Plato's forms in being unchanging, impervious to the ravages of time. Yet where Plato tends to have a select few, though questioning this procedure in the *Parmenides*, Whitehead has forms for everything, thus thoroughly democratizing their domain.

During this period Whitehead made the strongest declaration of his Platonic affiliation:

if we had to render Plato's general point of view with the least changes made necessary by the intervening two thousand years of human experience in social organization, in aesthetic attainments, in science, and in religion, we should have to set about the construction of [his own] philosophy (PR 39).

Yet he later found it necessary to modify his position such that

the general Aristotelian principle is maintained that, apart from things that are actual, there is nothing—nothing either in fact or in efficacy (PR 40).

This emphatically applies to eternal objects as existing only in actual entities. From the systematic point of view, Whitehead is a moderate realist, an Aristotelian rather than a Platonist. Yet if we concentrate on the genesis of his theory, we find that he did hold, however implicitly, to the separate existence of eternal objects for a time. That time can be narrowly specified: from the revisions of *Science and the Modern World* until the insertion of the quotation above. Its early appearance in the printed text is somewhat misleading, for compositional analysis indicates that it was inserted after most of part II and the theory of concrescence in part III, including intellectual feelings, had been formulated.<sup>1</sup>

Whitehead did not always have [even immanent] "eternal objects." Speaking of *sensa*, he writes in a letter to Norman Kemp Smith dated January 24, 1924:

I should not call them 'eternal' because...I do not consider them as 'in time' in the primary sense of the phrase. I should call an unending event eternal (EWM 67).

The ambiguity of "eternity" as both timelessness and everlastingness is clearly present, for Whitehead initially understands eternity as everlastingness. Sometime during early 1924 he realized, however, that its other meaning, timelessness, could significantly improve his classification of objects.

In his earlier philosophy of nature he had distinguished between *sensa* or sense-objects, perceptual objects, scientific objects, and percipient objects. This is a somewhat ad hoc enumeration of various objects, which could be systematized according to their relation to spacetime. *Sensa* were, strictly speaking, outside time entirely, while all the rest persisted through time as enduring objects.

It is important to realize that when these *sensa* were introduced as eternal, as having an entirely different relation to time, they were conceived as purely immanent, as simply illustrating the surfaces of events. This is implicitly the Aristotelian doctrine of moderate realism. We do not see this if we read *Science and the Modern World* as a single interpretive whole, for the later chapter on "Abstraction" emphatically treats the eternal objects as transcendent. Nearly all books are conceived as interpretive wholes, but this book is an exception. There is a major shift between the first part delineating objects and infinitely divisible events, and the second part introducing actual occasions which cannot be further divided (EWM ch. 1).<sup>2</sup>

Eternal objects could be immanent in the early part, because even possibilities could be understood as illustrating future events. With the introduction of the temporal atomicity of actual occasions, the present differs ontologically from the future. Since the occasions are first atomized in the present, the future is devoid of occasions. There is nothing for the eternal objects representing future possibilities to be based on, so they are implicitly regarded as existing independently. Whitehead never comments on their mode of existence. In any case, he never claims that the eternal objects exist in a primary sense, from which the actual occasions may in some sense derive their existence.

Though it might seem an easy move, Whitehead resisted for quite some time the temptation to vest all forms in the mind of God. Apparently the realm of eternal objects (SMW) was felt to have its own unity and order, needing no explanation beyond itself. Yet the issue finally came to a head concerning unrealized eternal objects, a topic central to his theory of novelty, then expressed in the problematic doctrine of reversion. In the meantime Whitehead had become concerned with the role of togetherness, placing togetherness in concrescence, the process of actualization (PR 147f, 150, 189f). Thus when the relevance of forms unactualized in the world became the basic issue to be considered, Whitehead responded with the following reflection:

In what sense can unrealized abstract form be relevant? What is its basis of relevance? 'Relevance' must express some real fact of togetherness among forms. The ontological principle can be expressed as: All real togetherness is togetherness in the formal constitution of an actuality. So if there be a relevance of what in the temporal world is unrealized, the relevance must express a fact of togetherness in the formal constitution of a non-temporal actuality. (PR 32)

Heretofore Whitehead regarded the eternal objects to be ordered and interrelated by their respective relational essences (SMW 160-62). Now these purely formal relations were no longer deemed sufficient to bind the forms together in the absence of actuality. If there were no actual means of interconnecting them, then unactualized forms would have a very precarious hold on reality. There could be no novelty, for all new actualization makes use of forms hitherto unrealized. Whitehead now makes use of his emerging conception of concrescence as the growing together of the many past actualities into one, applying it to the problem of the multiplicity of the forms. Just as unrealized forms need togetherness, so do they all, and this can be achieved in a single act of primordial envisagement. Thus in a single "nontemporal concrescence" the multiplicity of eternal objects could be ordered and unified together.

I have called this "envisagement" or "conceptual realization" a "nontemporal concrescence" in order to underscore its affinities with ordinary temporal concrescences, which are finite unifications of causal influences growing together into concrete actualities. But Whitehead has become increasingly aware that present immediacy

can be identified with concreting, and pastness with the concrete determinateness of the concrecent product. If concrescence is thus intrinsically temporal, there could be no nontemporal concrescence. Also each concrescence instantiates creativity, while creativity as nonactual and temporal was earlier contrasted with God as the nontemporal actual entity (RM 88).<sup>3</sup>

By this reconception we may say that Whitehead moves from Plato to middle Platonism, locating the totality of the forms in the mind of God. The forms themselves, however, were uncreated (PR 257). Though he does not say so, we might consider the possibility that the eternal objects were limited to the individual essences. Then their togetherness could be effected by God's primordial envisagement, and the relational essences could be abstract expressions of this togetherness.

A Plotinian revision might intensify the scope of this nontemporal act to include not just the interrelation of the individual essences but their generation as well. After all, if the relational essences could be brought into being, why not the individual essences as well? This would avoid a glaring problem with the primordial envisagement, namely, the existence of a multiplicity of forms presupposed by, and hence "prior" to that nontemporal act. (It is difficult to see how this could be accomplished within the context of Whitehead's philosophy, however, for creativity always moves from the many to the one, not from the one to many [PR 21].)

The Plotinian revision would share with the primordial envisagement a common difficulty: if some eternal objects or other must be relevant to every conceivable set of circumstances, there will be hosts of utterly useless and utterly irrelevant forms, those which the world has simply passed by. To be sure, this need not be true for a Platonism recognizing only a restricted number of forms, or for divine omniscience already cognizant of the future in detail, but neither of these assumptions were available to Whitehead.

In any case, he opts for a nontemporal ordering of uncreated eternal objects. Yet his own ontological principle, if sufficiently generalized, requires that the nature of eternal objects be explained. The ontological principle places the reasons for things in actualities, either in terms of their process of coming into being, or in terms of their settled determinateness (PR 24). While the general Aristotelian principle, as a corollary to the ontological principle,

vests the reason for the existence of eternal objects in actualities, it does not account for their natures. Why are particular forms what they are? If there is reason for such natures, it must be located in some actuality.

Nontemporal generation dissociates the nature of eternal objects from their ingredience in the world. We could conceive of them as temporally created, however, insuring that they remain always relevant to the passage of nature. The paradoxical air of this claim can be mitigated by realizing that these are essentially "atemporal objects," objects which abstract from time, and in particular from their temporal origination. They merely "appear" to be atemporal because their temporal origination has been systematically ignored.<sup>4</sup> Yet with respect to the atemporal, there can be no difference between seeming and being. The eternal objects are abstractions from actual occasions, provided we can sufficiently account for novelty.<sup>5</sup>

Such a theory, however, runs into difficulties with respect to metaphysical principles. These cannot have a temporal origination, for there can be no occasions before which they were operative. Here we can have recourse to Robert C. Neville's theory of creation. Whatever is in any wise determinate, such as the metaphysical principles, requires determination. Since that from which they are determined must in the last resort be absolutely indeterminate, they must be created *ex nihilo*. This act, moreover, determines God as the creator of these principles.

Many process thinkers conceive the metaphysical principles to be the final basis of explanation, principles which God exemplifies. Yet this does not account for the determinateness of the principles themselves, particularly for a philosophy committed to finding all reasons in the actualities themselves, according to the ontological principle.

Previously Neville tended to argue that any set of first principles needed to be grounded in some transcendent unity, but since Whitehead's principles are interdependent, they already have unity. The present argument that whatever is determinate requires determination is more powerful, and has the added advantage of being warranted by the ontological principle.<sup>6</sup>

Thus in creating the metaphysical principles God creates the necessary features of the world and Godself as the creator of this world. But that need be all God that God determines timelessly.

Neville holds that God eternally creates all things, but from the perspective of process theism, whatever else that is determinable can be contingently determined. Timeless creation must determine what is atemporal, whether necessary or possible, but the temporal, contingent and concretely actual can be determined by temporal creation.

If God's creating were wholly to determine an event, then either the event's causal and self determination would be for nought, or the event would be determined twice over. It seems better to conceive timeless divine determination, past causation, and self-determination as all necessary determinants of the event, although none would be sufficient. If God's role is restricted to the determination of metaphysical principles, however, we are left with a very abstract deism. Yet God could be further characterized as the contingent, temporal provider of aims for temporal actualities. Should God determine their contingency any further, their freedom would be jeopardized. Should God not determine their contingency at all, either chaos or causal determinism would take over.

These aims include novel aims. Then novelty can ultimately come from God by means of the eternal objects which serve as these initial aims. We find it necessary to replace these eternal objects with "subjective forms," understood in a more restricted sense. Whitehead allows for the re-enactment of subjective form, which means they function as eternal objects or objective forms under certain circumstances. For me, subjective forms are never objective forms, for they cannot be isolated from the subjective activity in which they inhere. Thus the novelty is communicated to the occasion, which actualizes this possibility before it can be objectified.

In providing aims, including novel aims, appropriate to each situation, God is dynamically responsive to contingent occasions, God must be both personal and temporal. For Neville, however, God is eternal. He sees eternity as "both the ground and the fulfillment of the temporal," illustrating this with respect to Boethius' account of eternity as an endless life made whole and perfect in a single moment.<sup>7</sup> He adds this proviso: "A degenerate image or theory of eternity is that it is something by nature static and unchanging, such as a mathematical equation or a form; this is sometimes attributed to Plato but it really comes from modern confusions of space with eternity as the contrast term to time."

Whether degenerate or not, the basic sense of timelessness is form, for form can be divorced from the spatiotemporal rootedness of ordinary actuality. In modern philosophy form is understood as objective. Insofar as eternity is more than objective form, we submit, it can be understood in terms of time, provided we take into account time in its transcendent mode.

If the objective fundamentally contrasts with the subjective, then insofar as eternity is more than objective, it involves the subjective. The endless "life" of the Boethian eternity would then entail nontemporal subjectivity. The key question is whether subjectivity could possibly be nontemporal. The Boethian moment, if understood as a nontemporal instant, seems to squeeze out all the life, without which this eternal experience could not be. If subjectivity were inherently temporal, then timelessness could only be objective. Only degenerate eternities could then exist. This may not yet have become fully apparent at the time of Descartes, when the subject/object contrast was first clearly discerned, but it is evident in Whitehead's philosophy.

It is extraordinarily difficult to determine whether nontemporal subjectivity is possible. Aristotle conceived of an Unmoved Mover contemplating the forms. This model is not applicable for Plotinus' One, which may be considered to be beyond subjectivity and objectivity, but it is appropriate, with modifications, for the Mind: the one mind timelessly contemplates the many intelligibles. Intelligibles are not merely objective forms; the subject/object contrast may be a good way to conceive the one/many contrast within Mind. Yet does it warrant us in ascribing subjectivity to the Mind? Jewish and Christian piety, informed by the passionate personalism of the Biblical God, thought so, but did this have sufficient philosophical warrant?

Whitehead, starting with the assumption that God was nontemporal, found no good way to infer to God's subjectivity, until he adopted divine temporality as well as nontemporality.<sup>9</sup> As we have seen, while the nontemporal ordering of the eternal objects might be conceived as a concrescent unification on the order of the dynamic unifications of ordinary actual occasions, Whitehead never calls it a "nontemporal concrescence." Ever since he introduced temporal atomicity into his theory of events, the contrast between becoming, the coming into being of an actuality (its concrescence), and its resultant being, was deepened and emphasized as the heart

of his philosophical analysis. Since the resultant being of an actuality was the way it could be objectified, the becoming in contrast could be understood as subjectivity. This is the cause of his notorious panpsychism, better conceived as pansubjectivity. Every event is presently subjective in its becoming, in order to be objectively past in its being. The most generic meaning of the subject/object contrast is temporal, ontologically conceived.

If subjectivity is thus inherently presentness, it is also inherently temporal, and any nontemporal subjectivity becomes problematic. We may consider this in terms of subjectivity's objective correlate, personhood. God is naively portrayed in personal terms in the Bible. This may be evaded as anthropomorphism, or as unwarranted projection, or as expressing something deeply significant about God. This depends upon an ontological determination of the meaning of personhood. I take a person to be essentially a dynamic responsive center or source of value. A nontemporal being can be apparently responsive, but true responsiveness requires temporal existence. Hence we need to explore whether there can be any adequate temporal counterpart of eternity, insofar as it is more than formal objectivity.

This project seems all but impossible to achieve in the light of Neville's observation that "Process philosophy in Whitehead and Hartshorne, too, comes down to the view that only the present is real, that the past is gone and the future is not yet."<sup>10</sup> This may seem unduly restrictive, but it is affirmed by some Whiteheadians, such as Ivor Leclerc, who considers past occasions to be no longer actual, and Donald W. Sherburne, who argues that the snows of yesteryear are nowhere.<sup>11</sup> These philosophers presuppose a univocal meaning for actuality as acting, or more precisely, as the activity of concrescing, the process of actualization. Yet Whitehead himself stubbornly maintained the actuality of past actual occasions.

This is obscured for us by his talk of "perishing." In neither type of perishing, however, does the past perish. In one mode the subjective immediacy of the present perishes, thereby transforming the activity of present unification into the unity and being of the past (PR 60, 81f; cf EWM 194-96). In the other mode the relatedness of the past to the present fades by the interposition of added occasions between any given past and the ongoing present (PR 340). Such fading is overcome by God's perfect prehension of

the past, thereby guaranteeing that every element of the past is preserved in an active concrescence.

If past occasions are still actual, then a case can be made for thinking of the future as having some actuality as well. For Whitehead, at least implicitly, actuality can have diverse meanings based on temporal modality. As present, actuality is active becoming, as past it is concrete determinateness. Perhaps as future actuality has as yet another meaning, as long as there is only one kind of actuality per temporal mode to avoid the problems of dualism, so evident in Descartes' philosophy. I propose that we conceive of future actuality as the infinite instantiation of creativity, as the infinite divine activity.<sup>12</sup>

We usually conceive the future in terms of possibility (our present projections upon a purely passive future), or in terms of "future actuality," where actuality is implicitly understood in terms of concrete determinateness. In that sense we describe what will be the case at some later date, i.e. what will have become determinately concrete then. Then, of course, it will no longer be future but past. For on the usual view only the present and the past can be actual. The future can also be actual as the source for the creativity of present occasions. The creative advance marks the diversification of future creativity to empower the activity of present occasions.

Neville describes the shifting character of the future, "each shift occasioned in the temporal order by some antecedent present decision affecting the future."<sup>13</sup> These are the conditions which the present lays down on future, as Whitehead describes them (AI ch. 12). In addition, to my mind, there is the subjective reception of the past coupled with the divine evaluative responses which guide our present actualizations, particularly with respect to novelty.

Consider Neville's account of Plotinus: "Eternity is the response of soul in its infinite completeness. It contains time within it as a potential, but not as actually following out the sequence of moments."<sup>14</sup> For process thought divine future experience is not perfect according to the perfection of being, which requires God to know the future as if it were already as determinate as the past. However, it contains the fullness of the past as it becomes past, and the unbounded reaches of the future. It is not immutable, for it enjoys the perfection of becoming, being constantly open to further enrichment. It does notprehend (know) the thin wedge of the

present creative advance, for there is (as yet) nothing determinate to know.

Apart from this thin wedge, the divine future concrescence meets all the requirements of the Boethian eternity: an endless life whole and perfect in a single moment. We ordinarily take "moment" to be a fleetingly brief temporal period, and so it is in the case of ordinary actual occasions, which must "perish" in order to be objectified as causally efficacious in the world. Yet God's "moment" never perishes, being a single everlasting act of unification, constantly experiencing and integrating those experiences within the divine life.<sup>15</sup>

Suppose, on the contrary, that God of process theism were to experience the present as well. It would then contain all time in the sense of prehending all past and present occasions from the "standpoint" of the entire region of the future. This completeness would be achieved at the expense of the present's indeterminacy of becoming. Then there would be no present becoming, no finite subjectivity, creativeness, or self-power. Instead of God encompassing all becoming as well as prehending all being, God bequeaths the power of creative becoming to the present, and then reaps the results. God forgocs this kind of completeness in order to foster finite creativity, which requires the transition from an initial indeterminacy to determinate prehensibility.

This future contains the present within it as potential, which is actualized as present moments of becoming, resulting in past being. The pluralization of time first takes place in present atomization, so that God experiences the future as one single whole, which lacks only immutability to fit classical understandings of eternity.

Philosophical theists, enamored of immutability, tend to identify God with the One. Atsushi Sumi, in his essay for this volume, makes a very persuasive case that "creativity" ought to be correlated with the One as its more pluralistic and immanentistic counterpart. Then God could be understood as the "basic Psyche" (AI 147) combining both primordial Mind with the temporal dynamism of Soul. Classical theists have limited God to the One, or Mind, or both, but process theists would be inclined to assign all three hypostases, in their non-particularized form, to God.

The One is beyond being. In Whitehead's terms, this means: what is beyond determinate being. Present concrescing occasions are beyond the being they produce, but their multiplicity excludes

them from comparison with the One. Future activity is not so divided. The One is fecund. By process it leads to Mind, to Soul, and to totality of the World. Future activity is likewise fecund, providing the creativity and aim making it possible for the creature occasions to create themselves, thereby furnishing the universe.

One of the most striking parallels concerns Plotinus' account of the descent of the soul. The soul is originally aspatial, yet in its descent acquires a spatial location.<sup>16</sup> The soul as the incipient self may be considered in Whiteheadian terms as the initial subjective aim derived from God, which the occasion in its self-creation makes into an actuality. While it is a disputed point whether the process of actualization ought to be considered temporal or not,<sup>17</sup> the actuality itself is in ordinary, physical time.

While the structure is the same, the evaluation of the process of making space is opposite. For Plotinus, it is a descent, a dispersal of the soul into matter and confusion; for Whitehead it is a creative achievement, ultimately enriching God.

Here it is instructive to consider the four stages outlining the relation between God and the world in a later neoplatonic thinker, John Scotus Erigena. The first and fourth stages express God's procession forth in creating the world, and the return of all things into God at the end. Yet it is important to note that the return contains precisely the same as its procession. Otherwise it would be impossible for God to be perfect, complete, containing all things from the beginning. Were the return to contain more, it would be a superfluous addition undercutting the eternal completeness of God. Yet the pointlessness of such a process and return is awesome.

Corresponding to the fourth phase would be Whitehead's concept of the consequent nature of God, the way God experiences and is enriched by the actualizations of the world. Classical theism conceived of God as perfect being, complete in itself, and tolerating no additions. Process theism, on the other hand, conceives of God as perfect becoming, for whom enrichment is always possible.<sup>18</sup>

The four phases are:

1. *That which is uncreated and creates.* This is God as creating, which best corresponds to Neville's nontemporal creation. Both thinkers regard God apart from creation to be absolutely indeterminate, a *Nihil*. Insofar as knowing (prehending) means

knowing something determinate, God apart from creation could be said not to be able to know Godself for both thinkers.

For Whitehead God is not so much uncreated as self-created, establishing the principles God exemplifies (PR 344). God does not totally create any actuality, certainly not *ex nihilo*, but God is a necessary yet partial factor in the creation of every occasion by providing its initial subjective aim, the specific possibility inspiring the occasion's actualization.

2. *That which is created and creates.* Erigena meant the Christ conceived as the logos, but for Whitehead it takes on added significance in terms of the actual occasions, having received their aims from God (and in that sense being created), can actualize themselves in a process of concrescence which is their self-creation. They achieve more than they receive, and this achievement enriches God.

3. *That which is created and does not create.* The world, which is created by God for Erigena, and by God and finite concrescences for Whitehead.

4. *That which is not created and does not create.* The return of all things into the *Nihil* for Erigena, but the enrichment of God's consequent nature for Whitehead.

If we return now to the contrast between Neville and process thought, we see that he argues that "the past, present, and future modes of time are not temporally related: they are eternally related."<sup>19</sup> "The only way by which temporally distinct things can be together in such a way as to be temporally related is by being created together *ex nihilo*."<sup>20</sup> There need not have been three temporal modes, for everything could have been determined nontemporally, or in a gradual fashion requiring solely a future creator and past creatures. But whatever arrangement obtains, it must be nontemporally determined, in order to apply to all moments of time whatever."

Neville continues from the last quotation:

The creative act is eternal and has as its end product the temporal order which is also eternal in the sense explained. Therefore, I would say, in

accord with Plotinus, that the creating of the temporal order is ■ vast eternal life, fully dynamic as containing all dateable things in all their temporal modes and as in constant dynamic shifting. This is life in the fullest sense.<sup>22</sup>

This follows from Neville's view that the nontemporal act creates everything, not just the nontemporal. It excludes the temporal from creating the temporal. The term, "temporal order," is wildly ambiguous. Insofar as it means the togetherness of the temporal modes, it is most plausibly understood as nontemporally determined. Insofar as it means the whole temporal adventure containing all concrete temporal instances, much must be granted to finite acts of self-creation. Yet as a description of divine life, provided that life includes what is received from the world as well as what God supplies, it applies equally well to Whitehead's conception of God.

Eternity transcends time. Does this mean that time is derived from eternity? The process theist finds this to be implausible, and tries to derive eternity from time. This can be done provided eternity means strict timelessness. Much analysis of eternity permits this, for this is the best way to protect God's changelessness. Change requires the difference between two successive moments, but there can be no such difference if there is no temporal succession. Other accounts of eternity seem to relax this requirement of strict timelessness. If so, they can be understood in terms of the temporality of the future. The future has the indeterminacy, the fecundity and the power of eternity, yet without the suggestion of timelessness.

## NOTES

1. Though these passages are only a page apart, they appear to come from different strata of Whitehead's composition. According to the analysis of EWM, PR 39 is part of the original text of II.IC, while PR 40 forms part of an insertion from G, introduced after the basic part of parts II (c) and III (DEFH) were written. On PR 40, see also MF 131–36.
2. Or see "Whitehead's First Metaphysical Synthesis," *International Philosophical Quarterly* 17/3 (September, 1977), 251–64.
3. The nature of nontemporal concrescence was explored in "The Non-Temporality of Whitehead's God," *International Philosophical Quarterly* 13/3 (September, 1973), 347–76, but this needs some correction. It ascribes subjectivity to the nontemporal concrescence which Whitehead implicitly rejects, and its notion of ■ nontemporal decision is a difficult one, best replaced by Neville's nontemporal determination. (The difference is that decision presupposes prior alternatives, and determination does not.)
4. A "real" eternal object differs from a merely "apparent" one in that it was available for temporal instantiation before the apparent one emerged, while the apparent one was not. Yet neither was instantiated in fact earlier, for had it been, the apparent one would simply have emerged earlier.
5. The extension of the ontological principle to embrace the natures of eternal objects, as well as their temporal creation, is discussed in my essay on "The Creation of 'Eternal' Objects," *The Modern Schoolman* 71/3 (March 1994),

## The Psyche, the Forms, and the Creative One: Toward Reconstruction of Neoplatonic Metaphysics

Atsushi Sumi

An attempt to restore Neoplatonism, especially Plotinus' metaphysics, probably sounds incurably anachronistic. While his exquisite depictions of mystic and religious experiences still provide some devout people of today with fresh jolt, his grandiose system of metaphysics seems even to them to take no firm root in the intellectual climate of our age. Indeed the majority of today's students of Neoplatonism believe that its analyses of theological and psychological concepts have more to offer and that all present appearances point in the direction toward the burial of its metaphysics.<sup>1</sup> This trend precisely points to the contemporary relevance of Neoplatonism that, according to Wallis, its empirical basis "offers an antidote to the view, widespread among modern Anglo-Saxon philosophers, that philosophy must accord with the dictates of 'common sense.'"<sup>2</sup> His remark indeed appears to be moderate, but I cannot but raise a rather basic question. Do *all* present appearances really lead to the burial of Neoplatonic metaphysics, even though it is consistently connected with the Neoplatonic analyses of psychological notions? Can there be any trend toward reconstruction of Neoplatonic metaphysics? Hence the main purpose of this paper is to explore the possibility of revitalizing Neoplatonic metaphysics as the foundation of a viable *Weltanschauung* in our age. First of all, we need to find an initial step to this grand undertaking. The initial step will drive us to more specific problems to be discussed in this paper.

In *Adventures of Ideas* Whitehead stresses the modern relevance of several notions in Plato's later writings. His later thought circles round the interweaving of seven main notions: the Ideas, the

Physical Elements, the Psyche, the Eros, the Harmony, the Mathematical Relations, and the Receptacle.<sup>3</sup> Whitehead remarks that they are "as important for us now, as they were then at the dawn of the modern world" (AI 147). Two aspects of them are briefly mentioned. In the first place, we can only conceive a complete fact in terms of these notions, concerning the nature of reality, which connect philosophy and science (AI 146, 158). The possibility of connecting them depends upon the primary concern of metaphysics, the discovery of the general principles under which specific principles of science should fall.<sup>4</sup> Precisely as metaphysical principles, the Platonic notions are "philosophic, and in the narrow sense not scientific" and "suggest no detailed observation" (AI 151). In the second place, all philosophy is an endeavor to express a coherent system interweaving the Platonic notions with some modification (AI 158, 275). This point is admittedly applicable to Neoplatonism, because some of the seven notions—the Forms, the Psyche, the Eros, and the Receptacle—are interwoven into the frame of its metaphysics.<sup>5</sup> Whitehead's view of the Platonic notions in *Adventures of Ideas* certainly opens up a path to reconstruction of Neoplatonic metaphysics and therefore should be treated as the initial step in our inquiry. Thus our basic strategy of reconstruction is to conceive a coherent system of these notions. Moreover, the Neoplatonic metaphysics to be reconstructed is expected not only to connect science and philosophy, but to reconcile science and religion.<sup>6</sup>

Whitehead maintains that his own philosophy of organism in *Process and Reality* renders "Plato's general point of view with the least changes made necessary by the intervening two thousand years of experience" (PR 39/63). According to him, "[all] modern philosophy hinges round the difficulty of describing the world in terms of subject and predicate, substance and quality, particular and universal" (PR 49/78). To avoid the pitfalls disclosed by modern philosophy, he says, we must be brought back to "some restatement of Platonic realism" (PR 50/79).

The main problem of this paper is as follows. How can we reconstruct Neoplatonic metaphysics with some necessary modifications, by developing Whitehead's view of the Platonic notions, so that it serves as a solid foundation of a viable view of the world? This problem takes shape with the following three problems. The first problem is why such notions like the Psyche,

the Forms, and the Receptacle are still important for us today. Here Whitehead's thoroughgoing criticism of scientific materialism in *Science and Modern World* is reviewed, and his interpretation of the Platonic notions in *Adventures of Ideas* is analyzed in light of this criticism. The Platonic notions need to be unified into a coherent system. This systematization drives us to the problem concerning the way of interweaving two key notions, the Psyche and the Forms. The second problem is hence what principle their interweaving must satisfy. Moreover, we will discuss whether or not this principle can be consistent with Neoplatonic metaphysics of antiquity. For this inquiry, the relevant passages in *Adventures of Ideas* will be compared with the doctrine of the conceptual realization of eternal objects in the primordial nature of God in *Process and Reality*. The final problem is how the complex thus interwoven of the Psyche and the Forms must be modified for a satisfactory interpretation of our experience of creative advance of the universe toward novelty. For this inquiry, again, we need to refer to Whitehead's doctrine of the realization of an infinite and unordered multiplicity of eternal objects in the primordial nature of God in *Process and Reality*. In addition, we will consider two problems concerning the Neoplatonic One that does not fall under the seven Platonic notions. First, on this modification, are there still some exigencies to posit the Neoplatonic One? Second, if there are, what conception of the One is really compatible with the complex of the Psyche and the Forms? In short, an analysis of the relevant passages from the ninth chapter of *Adventures of Ideas*, "Science and Philosophy," constitutes the basic method in this paper. To develop the possibility of reconstructing Neoplatonic metaphysics, furthermore, we must clarify the philosophical concerns and merits of Whitehead's own philosophy of organism and exploit rich suggestions from it, after the counterparts of the Platonic notions in discussion are identified. These suggestions surely indicate necessary modifications for the metaphysics to be reconstructed.

### I. The Delineation of the Neoplatonic Metaphysics to Be Reconstructed

Starting from the seven Platonic notions mentioned in *Adventures of Ideas*, our attempt to develop the possibility of reconstructing Neoplatonic metaphysics first encounters a question why these notions are still "important for us now." By answering this question we can delineate the general character of the metaphysics to be reconstructed. To understand contemporary relevance of the Platonic notions we should not overlook the sets of problems and issues which occupied Whitehead in his later period.

#### 1. Whitehead's Criticism of Simple Location and Substance-Quality Metaphysics

Whitehead regards the doctrine of simple location and the substance-quality metaphysics as two fundamental assumptions which underlie the whole philosophy of nature during the modern period (SMW 48-55). In the following we may briefly review his criticism of them.

Described by the fundamental notions, matter, space, and time (SMW 142),<sup>7</sup> the ultimate fact in the scheme of Newtonian physics is nothing else than a configuration of material particles at a durationless instant of time. Such an ultimate fact has the character of what Whitehead calls "simple location"; material can be said to be *here* in space-time, "in a perfectly definite sense which does not require for its explanation any reference to other regions of space-time" (SMW 49).<sup>8</sup> Since the matter in question is sufficiently describable without any reference to other portions of matter and to past or future, the character of simple location involves the denial of internal relations.<sup>9</sup> Matter in the Newtonian scheme is in itself "senseless, valueless, purposeless" (SMW 17).<sup>10</sup> This assumption of inactive matter having the character of simple location and following a fixed routine imposed by external relations is termed "scientific materialism" (SMW 17) or "materialistic mechanism" (SMW 50).

Modern physics abandons the doctrine of simple location, entirely unsuited to the scientific situation of today (SMW 17; AI 157-158). It is inconsistent with the notions of velocity and momentum because of its rejection of internal relations (MT 145-146). Whitehead does not consent to Bergson's view that

simple location is a vice necessary to the intellectual apprehension of nature. It is rather an error of mistaking the abstract for the concrete, an example of what he calls "the fallacy of misplaced concreteness" (SMW 50-51).<sup>11</sup> Accordingly his criticism of simple location does not point toward anti-intellectualism. This point must not be overlooked insofar as his criticism brings us back to "a fundamental Platonic doctrine" (AI 157-158).

Another assumption is the two correlative categories of substance and quality: "the final metaphysical fact is always to be expressed as a quality inhering in a substance" (PR 157-158/239). The substance-quality metaphysics has entrenched itself in Aristotelian logic which exhibits the formal structure of everyday usage of language in the subject-predicate form of proposition, so that there is a sound pragmatic defense for its employment in language.<sup>12</sup> Linked with simple location (SMW 52-53), the substance-quality metaphysics refuses internal relations among physical things (PR 50/79-80). When the metaphysics invokes the Lockian distinction between primary and secondary qualities, nature as such, deprived of secondary qualities, is "a dull affair, soundless, scentless, colorless; merely the hurrying of material, endlessly, meaninglessly" (SMW 54).

Christian aptly summarizes Whitehead's criticism of the substance-quality metaphysics.<sup>13</sup> There are two metaphysically false elements in traditional interpretations of substance. One is the conception of a static and vacuous substratum or an unchanging subject of change; the physical substances are sheer facts, devoid of all intrinsic values, so that their generation, endurance, and corruption cannot be explained at all (FR 24).<sup>14</sup> Another element is the notion that substances exist in isolation, completely independent of each other. Refusing internal relations (AI 133), a doctrine of the disjunction of primary substances renders an explanation of change impossible. On the substance-quality metaphysics, no sufficient explanation is possible of the interconnectedness of things which is evident and pervasive in our experience.<sup>15</sup> Hence substance and quality are another instance of the fallacy of misplaced concreteness (SMW 52). Whitehead's treatment of substance as a whole, however, does not amount to a total rejection of it. It is "the notion of an actual entity as the unchanging subject of change" (PR 29/43) that is viewed as sheer error to be abandoned in his philosophy of organism.<sup>16</sup> In the

subsequent discussion, the first and the second elements are respectively called "the static fallacy" and "the isolation fallacy" for brevity.<sup>17</sup>

The possibility of reconstructing Neoplatonic metaphysics is exactly based on the possibility of the Platonic notions to replace the basic concepts of the classical Newtonian scheme. From this viewpoint the question why the Platonic notions are important for us now must be considered. Before examining their contemporary relevance, we may sketch the fundamental features of the world view based on the metaphysics to be reconstructed. In the world view which is to replace scientific materialism,

[n]ature is a theater for the interrelations of activities. All things change, the activities and their interrelations (MT 140).

Thus the new world view has two basic features. First, it aims at avoiding the static fallacy by replacing senseless, valueless, and lifeless matter by activity and process (MT 140).<sup>18</sup> Second, the new world view restores internal relations among real things to eschew the isolation fallacy.<sup>19</sup> In the following, we shall examine whether or not the Platonic notions—especially the Psyche, the Forms, and the Receptacle—can serve as the fundamental notions of the world view to be expected.

## 2. The Psyche as the Self-Moving Cause of Change

The basic notion in our metaphysics is activity and process. The notion of activity involves a physical side and a mental one; the latter is the Psyche (AI 275). Whitehead focuses attention on two aspects of the Psyche. In the first place, the Psyche's active grasp of the Forms conditions the universe. Being entertained in the Psyche, the Forms obtain efficiency (AI 147). The entertainment of the Forms is intrinsically associated with an inward ferment, an activity of subjective feeling, and an appetition which melts into action. This is the Eros, the urge toward ideal perfection (AI 148, 275). In the second place, the Platonic Psyche is contrasted with the Aristotelian self-identically enduring substance. Without the Psyche and the Eros, we should obtain a static world (AI 275-276).

The notion of the Psyche in the second aspect avoids the static fallacy. It is obvious that Plato's definition of the soul as the self-mover or the cause of all change and motion,<sup>20</sup> accepted also by

Plotinus,<sup>21</sup> is exploited for the avoidance. As Plato views the physical universe as "a sort of moving process of becoming" (*Sophist* 246c),<sup>22</sup> and Plotinus holds such a dynamic conception of nature that everything is endowed with contemplative force,<sup>23</sup> nature in our metaphysics is entirely permeated by the Psyche and has the power of contemplation, replacing the materialists' view of "senseless" matter.

The notion of the Psyche appeals to the viewpoint of modern science "expressed in terms of energy, activity, and the vibratory differentiations of space-time" (MT 137-138).<sup>24</sup> In modern science, the notion of the substratum composed of self-identically enduring bits of matter has been abandoned, because of the identification of matter with energy which is sheer activity. "The soul entertaining ideas" as the mental side of actuality would be synonymous with "an underlying eternal energy in whose nature there stands an envisagement of the realm of all eternal objects" (SMW 105). Whitehead regards the notion of physical energy as "an abstraction from the complex energy, emotional and purposeful, inherent in the subjective form of the final synthesis in which each occasion completes itself" (AI 186). Following this suggestion, we can consider physical energy to be an abstraction from the Psyche's self-motion guided by the urge toward ideal perfection or the Eros. The business imposed upon our metaphysics is to describe more concrete facts, of the Psyche and the Eros, from which the abstraction is derivable.

How can the Psyche meet the isolation fallacy? Here we may invoke Plotinus' doctrine of cosmic sympathy. The organic unity of the universe for him is characterized by sympathy, without which individual parts of the cosmos "would fall into atomistic isolation."<sup>25</sup> In virtue of this organic unity, those parts "encounter each other (πρὸς ἀλλήλα συνιόντα)" (IV 4 [28], 32, 34),<sup>26</sup> being internally related to one another. Plotinus' theory of cosmic sympathy is lead by his analysis of Plato's conception of the universe as a single living being in *Timaeus* 30d-31a, and the analysis results in the ascription of sympathy to the operation of the cosmic soul (32, 4-22).<sup>27</sup> He further applies sympathy to an account of experience; sensation is grounded in the sympathetic unity of the cosmos (IV 5 [29], 3, 18-20).<sup>28</sup> This theory is akin to Whitehead's view that a fact of perception calls for internal relatedness in which one entity has an effect on another (PR 56/88-89, 145/219-220).

Plotinus even appeals to sympathy in order to interpret comprehensively various mysterious phenomena.<sup>29</sup> Although it may seem to Whitehead and his followers to be immature, the Plotinian theory of sympathy has some possibility of coping with the isolation fallacy. To develop this possibility, our metaphysics must patiently work out several problems. In the first place, temporality must be taken seriously for more strict formulation of the notion of sympathy, so that the notion becomes viable within our view of the universe as incessant process. In the second place, our metaphysics must give a detailed account of sympathy among souls, which Plotinus did not fully unfold (IV 3 [27]; 8,1-3; IV 9 [8], 3,1-6), in order to treat adequately, for example, the problem of other minds.<sup>30</sup>

### 3. The Forms as Pure Possibilities

Whereas Whitehead restores the Platonic Forms as eternal objects in his systematic thought,<sup>31</sup> his account of the role of the Forms in *Adventures of Ideas* is quite brief; the connection and the disconnection among the Forms, as discussed in the *Sophist*, determine compatibility and incompatibility for their joint exemplification (AI 147, 277).<sup>32</sup> Hence we are compelled to develop this account with recourse to other works.

The relevance of the Forms to our age is evinced by the doctrine of evolution ascribed to the nineteenth century. On the materialistic theory relying on external relations between portions of matter, evolution cannot be adequately explained (SMW 107). The doctrine of evolution calls for "a conception of organism as fundamental for nature" and "an underlying activity...expressing itself in individual embodiments, and evolving in achievements of organism" (SMW 107). The latter, of course, has something to do with the Psyche as the self-moving source of activity, while the former appeals to the Forms. Whitehead supposes that "non-materialistic philosophy of nature will identify a primary organism as being the emergence of some particular pattern" (SMW 103). On the general principle that "in a new environment there is an evolution of the old entities into new forms" (SMW 107), the organism either purposefully reiterates an old pattern or selects a new one. Here the role of the Eros can be acknowledged, too. The organism is "a unit of emergent value, a real fusion of the characters of eternal objects, emerging for its own sake" (SMW 107). The evolutionary process is hence viewed as the theater of the embodiment of patterns, and this view dismisses

the materialistic conception of nature as valueless and purposeless.<sup>33</sup> In addition, "the emergence of novel organisms" certainly requires the Forms as timeless possibilities. Nothing novel comes to being out of nowhere; something novel must be "given" as an unrealized potentiality (PR 45-46/72, 164/249). Without unrealized possibilities, we must obtain "a static monistic universe" (PR 46/72). The possibility unrealized in the temporal realm, if it is not given out of nowhere, must be atemporal or eternal.<sup>34</sup> This insight, which was not entertained by ancient Platonists, must be fully exploited in our reconstructive undertaking. In a word, "eternal things are the elements required for the very being of the process" (SMW 108).

In Whitehead's own system eternal objects serve as pure potentials for actualities. The terse account of the Forms in *Adventures of Ideas* can be seen in terms of their status as potentials for becoming. Each Form has not only its own unique individual essence, but a relational essence which indicates its reference to other Forms and thereby determines how it is possible for the Form to be instantiated in the process of becoming (SMW 159-160). The Forms thus interconnected constitute such a realm of possibility that "is disclosed by all the untrue propositions which can be predicated significantly of" a physical event (SMW 158). (Whether or not the realm of Forms should be conceived to be intrinsically ordered will be discussed later.) Therefore the physical realization of a possibility in the event exactly means the selection and limitation of that possibility for its own sake, excluding all other possibilities. The outcome of this limitation is value, so that "the definite finite entity is the selected mode which is the shaping of attainment" of value, which amounts to the intrinsic reality of that entity (SMW 93-94). The conception of organism as "a unit of emergent value" is thus explicated by the role of the Forms as possibilities for becoming.

Several interpreters, we may note, hold that Whitehead's notion of the Forms as possibilities represents his criticism of Plato's notion of them as a kind of self-sustaining actuality.<sup>35</sup>

In addition, the introduction of the Forms is able to replace the basic scheme of the substance-quality metaphysics. The Aristotelian substance or self-identically enduring entity is dissolved to some retention or reiteration of an emergent particular pattern derived from the Forms (SMW 104, 108, 119-120, 152).

The same dissolution is fully achieved in the passage of the *Timaeus* dealing with the Receptacle; Plato there urges us to conceive the universe, not as a domain of self-subsisting things, but as a moving pattern of recurring characteristics (48e-52d) or images of the Forms.<sup>36</sup> For the dissolution to be successful, the so-called substantial or substantival Forms must be on the same footing as the qualitative or adjectival ones in the proposed inventory of the Forms.<sup>37</sup>

#### 4. The Receptacle as the Matrix of Interconnectedness

The Receptacle in Plato's *Timaeus* is that in which images of the Forms appear to arise and pass away. The Whiteheadian analogue to it, the metaphysical continuum of extension, receives an actuality, and each actuality atomizes it and occupies its region (PR 67/104). Therefore that in which eternal objects have ingression is not the metaphysical continuum of extension as such, but an actual occasion.<sup>38</sup> In *Adventures of Ideas* the Receptacle is considered mainly from such a point of view (AI 134).

Whitehead remarks on the relevance of the Receptacle to modern physics. Modern mathematical physicists do not believe that any mathematical formulae which apply to the happenings in space-time can be derived from a mere notion of space-time. Space-time in itself is bare of all forms. Conceived in abstraction from such mathematical formulae, therefore, the space-time of modern mathematical physics is "almost exactly Plato's Receptacle" devoid of all forms (AI 150).

The significance of the Receptacle is seen primarily in relation to the isolation fallacy. Imposing internal relations on all that happens, the Receptacle is the medium of intercommunication (AI 134).<sup>39</sup> Although such a role can be read nowhere in the *Timaeus*, he appears to elicit it from Plato's designation of the Receptacle as "the foster-mother of all becoming" (49a).<sup>40</sup> In our metaphysics, it is immanent characters or copies of the Forms that are reflected in the Receptacle. The characters are not ultimate actualities but actualities in a derivative sense that they are physically realized by virtue of an actuality or a Psyche. With Plotinus, we may call them "that which is in actuality (τὸ ἐνεργεῖν)" rather than actuality (II 5 [25], 2, 26-27).<sup>41</sup> Our metaphysics is thus expected to take on itself the difficult problem of explaining interconnectedness between those which are in actuality, rather than ultimate

actualities, in terms of the unity ascribed to the Receptacle, for solving the isolation fallacy.

#### 5. The Form and the Receptacle: The Logic of "Paradigmatism"

In the last subsection we never felt reluctant to accept the Platonic conception of becoming as the realm of images of the Forms. On the contrary, Whitehead commits himself to a realistic view of becoming and refuses the Platonic conception as an unfortunate result for both cosmology and theology (AI 167-168; PR 346-347/ 526).<sup>42</sup> In this respect, our position diverges from his thought and subscribes to the Platonic conception termed "Paradigmatism."

In the subsection on the Forms, it was mentioned that the dissolution of the substance-quality metaphysics was achieved in the *Timaeus* passage dealing with the Receptacle. The significance of this dissolution is cogently explained by Norio Fujisawa.<sup>43</sup> As the basis of the description of the physical world, the distinction between the Form and the sensible, with the notion of the former being the paradigm of which the latter is likeness, is placed in the outset of the discourse (27d-29c). In the passage dealing with the Receptacle (48e-52d), the physical world is viewed as a moving pattern of recurring characteristics rather than a realm of self-subsisting things, and the locution employing "this thing" as its subject is rejected for a description of phenomena. The principle of the causal theory of participation in the Form in the middle dialogues cannot do away with "this thing (x)" as its subject: "This thing (x) is beautiful (F), because it participates in the Beauty itself (Φ)."<sup>44</sup> In the recommended way of describing phenomena, therefore, "This (x) is beautiful (F)" in everyday language is rendered to the locution "In this part of the Receptacle the Form of Beauty (Φ) is imaged (F)," or "An image (F) of the Form of Beauty (Φ) has now come into this part of the Receptacle." By means of paradeigmatism, phenomena are described solely in terms of F and Φ, without referring to X.<sup>45</sup> The lines of thought which Plato pursues in his later dialogues are to question the ultimate status of "this something (x)" and to elaborate the logic of paradeigmatism; these lines point to the final answer in the *Timaeus*.

Fujisawa suggests that the logic of paradeigmatism saves nature from valuelessness entailed by the conception of the Aristotelian substance as ■ vacuous substratum:

... 'this thing' as subject-substrate, *x*, is in itself axiologically neutral and hence to hold such *x*s in some form or other to be ultimate factors in the world would seem to exclude values from the basic reality in the world and dissociate Being from Value.<sup>46</sup>

Whitehead's oversight of philosophical advantages of paradigmaticism cannot be reproached.<sup>47</sup> It is by no means such a logic that degrades the flux of becoming to mere appearance or illusion. The metaphysics to be reconstructed is not recommended to relinquish it.<sup>48</sup>

## 6. Summary

In our metaphysics, the Psyche as an actuality correlates with the Forms as potentialities. Distinguished from the actuality, the process of becoming is an actuality in its derivative sense or "what is in actuality." It is a moving pattern of recurring images of the Forms, mirrored in the Receptacle, by virtue of the Psyche's efficacy. The Receptacle is a potentiality because of the absence of agency from it. Our notion of the Psyche is not monopsychic. In addition to "a basic Psyche whose active grasp of ideas conditions impartially the whole process of the Universe," there are "finite souls of varying grades, including human souls, all playing their part in conditioning nature by the inherent persuasiveness of ideas" (AI 147-148). Accordingly the Psyche is categorized into two groups. The first is the non-temporal actuality which entertains Forms in itself. The second is the temporal actualities directly responsible for the temporal realization of Forms. The former and the latter, of course, are analogous respectively to Intellect and souls for Plotinus.

The fundamental theses of our metaphysics express the systematic interweaving of the Platonic notions. They are formulated with recourse to the outline of Whitehead's restatement of Platonic realism in *Process and Reality*. The first thesis prominently represents what he calls "Plato's general point of view" (PR 39/62); things which are temporal arise by their imitation of the things which are eternal.<sup>49</sup> The second thesis is that the finite souls of varying grades with the process of becoming and the eternal Forms are mediated by the basic Psyche which is both actual and timeless.<sup>50</sup> It is precisely by virtue of this mediation that the Forms can be instantiated in the temporal world. Finally, as

regards the interweaving of the basic Psyche and the Forms, Whitehead suggests that, by the nontemporal actuality, "the barren inefficient disjunction of abstract potentialities obtains primordially the efficient conjunction of ideal realization" (PR 40/64). Without such "efficient conjunction of ideal realization," novelty would be meaningless and inconceivable (PR 40/64). This suggestion indicates the direction in which the interweaving of the basic Psyche and the Forms may modify Plotinus' doctrine of Intellect.

In the initial stage, we attempt to rebuild Neoplatonic metaphysics as a Platonic metaphysics concerned with the defense of the immutability of the Forms, the basic thesis in Plato's theory of Forms (*Parmenides* 135b-c).<sup>51</sup> For the aforementioned first thesis to be consistent with this thesis, therefore, the Forms' constancy must not be compromised by them being imitated by their immanent characters. As for the interweaving of the basic Psyche and the Forms, moreover, we need to keep in mind that the active grasp of the latter by the former must not violate the latter's unchangeability. The defense of the fundamental thesis of the theory of Forms is one of Plotinus' serious concerns, when he discusses the causal relation between the intelligibles and the sensibles and the Intellect-intelligible identity.<sup>52</sup> This way, I believe, is the steadiest step toward the reconstruction. It would be itself Neoplatonic in the sense that it allows us to philosophize along with Plotinus who strived to systematize general ideas scattered through Plato's writings.

## II. The Interweaving of the Psyche and the Forms

In this section we purport to look into a principle which the interweaving of the basic Psyche and the Forms must satisfy. It is suggested that the inefficient disjunction of Forms obtains the efficient conjunction of ideal realization by virtue of the Psyche. But this view, *prima facie*, diverges from the traditional conception of the fixed order of Forms. Hence we may begin with the problem of how this interweaving renders "Plato's general point of view."

### 1. Whitehead on *Sophist* 248e-249a

In the passage dealing with the Platonic notions, Whitehead elucidates the ideal realization of Forms in the non-temporal Psyche:

Plato then passes on to the agency whereby ideas obtain efficiency in the creative advance. As he conceives them in abstraction, he finds ideas to be static, frozen, and lifeless. They obtain 'life and motion' by their entertainment in a living intelligence. Such a living intelligence with its 'gaze fixed upon ideas' was what Plato termed a Psyche... (AI 147).

The last sentence unmistakably refers to the Demiurge's contemplation of Forms in the *Timaeus* (28a, 29a). But the Demiurge is there conceived to see Forms as self-sustaining outside himself.<sup>53</sup> The view that Forms obtain efficacy by virtue of the intelligence comes from another dialogue, the *Sophist*. In the following we will review Whitehead's interpretation of the passage concerning the defense of the theory of Forms by "the friends of Forms."<sup>54</sup> According to him, the suggestion that the criterion of being as the power of acting and being acted upon<sup>55</sup> must be construed in terms of the doctrine of law of nature as immanent, which involves a doctrine of internal relations (AI 113). "The friends of Forms" refuse to define the soul's cognitive intercourse with Forms in terms of the relation of action and passion; they admit the criterion of being as applying only to becoming, but not to true being. Thus the Eleatic Stranger asks the crucial query, which reads in Jowett's translation quoted by Whitehead as follows:

Can we imagine being (τῷ παντελῶς ὄντι) to be devoid of life and mind, and to remain in awful unmeaningness an everlasting fixture? (*Sophist* 248e-249a).

This passage is highly controversial. Whitehead believes that Plato here still abides by the criterion of being and considers Forms to be acted upon in being known. Being acted upon, the eternality of Forms is connected with the fluency of becoming by the mediation of "life and mind." Here we do not question whether or not this is an accurate interpretation. But the theses that the atemporal objects are mediated with the temporal process by the non-temporal actuality and that those objects obtain efficiency by that actuality are closely connected with Whitehead's reflection on the above

cited passage. Thus he would be confident that they unmistakably render "Plato's general point of view."<sup>56</sup>

In spite of their difference in the exegesis of the *Sophist* passage, Whitehead and Plotinus share "Plato's general point of view" in respect of the thesis that Forms obtain "life and motion" in a living intelligence. Plotinus considers the intelligible objects placed outside Intellect to be "without perception and without any share of life or intelligence," and concludes that such objects are inconceivable (V 5 [32], 1, 32-38). Whitehead does not attempt to move from the ideal realization to self-knowledge of the intelligence. On the other hand, Plotinus refuses to think that Forms are acted upon by intellection, on the ground of the real unity of Intellect and Forms.<sup>57</sup> Whereas Plotinus gives no "demiurgic" implication to the Intellect-intelligible identity,<sup>58</sup> Whitehead seems to think seriously of the vulnerable point of Plato's theory that Forms in abstraction may be totally devoid of efficiency and useless for an account of becoming, as Aristotle points out.<sup>59</sup>

## 2. The Realization of the Forms in the Psyche and the Ontological Principle

In Whitehead's systematic thought the entertainment of Forms in the basic Psyche is rendered the conceptual realization of all eternal objects in the primordial nature of God, which is required for "the differentiated relevance of eternal objects to each instance of the creative process." The conceptual realization is the only answer consistent with what he calls "the ontological principle" (PR 256-257/392). In the subsequent discussion we employ the term "noetic realization" instead of "conceptual realization" which is prone to turn Forms to God's "concepts." For Forms to be "relevant" to the temporal process, again, physically unrealized Forms have some intrinsic relation to physically realized ones. Hence there must be intrinsic "togetherness" among Forms in noetic realization, which, on the ontological principle, must be togetherness in the formal constitution of a non-temporal actuality (PR 32/48, 46/73). What is then the ontological principle? Whitehead mentions it in the context dealing with the realization of eternal objects in God:

By this recognition of the divine element the general Aristotelian principle is maintained that, apart from things that are actual, there is nothing—nothing either in fact or in efficacy (PR 40/64).

The principle is basically the affirmation that some entities are fully existent, and secondly, that all other types of existence are derivative and abstracted from those fully existent entities.<sup>60</sup> In separation from the ideal realization, there is mere isolation of eternal objects, not only indistinguishable from nonentity but unrealized in the temporal world (PR 40/64).<sup>61</sup> Insofar as the Forms are related to the basic Psyche as potentialities are to an actuality, it is the principle that their interweaving must first exemplify.

The ontological principle is indeed an Aristotelian principle. Nevertheless Whitehead seems to regard the response by the Stranger in *Sophist* 248e-249a as an exemplification of it. As often pointed out, this passage is a *locus classicus* for Plotinus' conception of Forms as living and being active, necessary for the intellect-intelligible identity.<sup>62</sup> For him, in fact, there is no such thing as a Form subsisting outside Intellect: such a Form would be "without perception and without any share of life or intelligence." But he nowhere defines the relation between Intellect and Forms as that between actuality and potentialities. Therefore his doctrine of the presence of Forms within Intellect cannot be seen as an exemplification of the ontological principle, though his philosophy is never incompatible with it.

The status of the Plotinian One as the hyper-ontic activity (V 6 [24] 6, 3-9)<sup>63</sup> is a development from the ontological principle in its Aristotelian version. In a sense, Plotinus radicalizes it. He justifies his introduction of the hyper-ontic activity as follows:

Nor should we be afraid to assume the primary activity without real being, but posit this very activity as his, so to speak, hypostasis. But if one posited a hypostasis without activity, the principle would be defective and the most perfect of all imperfect. And if one adds activity [to the hypostasis] one does not keep the unity. If then the activity is more perfect than the real being, and the First is most perfect, the First will be activity (VI 8 [39], 20, 9-15, tr. A. H. Armstrong, adapted by A. Sumi).

Plotinus here maintains that the activity or actuality which makes a real being actual must be prior to the being to be actualized, by

considering a thing that is actual to consist of activity and being and thereby to be in duality. The ontological primacy of activity over being makes a remarkable revolution in ancient Greek metaphysics and a bold challenge to the Aristotelian tradition. Did Aristotle and his successors ever envisage a bare activity in separation from a primary substance, hylomorphic or divine? Moreover, the view that the real being without activity is defective would certainly bring us back to *Sophist* 248e-249a. Whitehead's interpretation of this passage that Forms, intrinsically devoid of efficacy, must be entertained in a living intelligence is based on his construction of "that which is completely real ( $\tau\omicron\ \pi\alpha\nu\tau\epsilon\lambda\omega\varsigma\ \delta\upsilon\nu$ )" as Forms. Plotinus, on the other hand, takes it as the intelligible world which does not consist solely of Forms, and explores the nature of intellection that may not infringe upon their unchangeability.<sup>64</sup> But, if it is read apart from the specific context of the *Sophist*, the passage under discussion will be construed otherwise; it is an activity expressed as "life and thought" that makes "that which is completely real" what it is. *Sophist* 248e-249a can be the *locus classicus* not only for Whitehead's application of the ontological principle to the relation between the non-temporal actuality and eternal objects, but for the Plotinian principle of the priority of actuality to being. Since Plotinus' reading of Plato's dialogues sometimes neglects the relevant context of a given text,<sup>65</sup> it is to some extent probable that he considers the priority of actuality to be a development of Plato's point of view. Needless to say, it is the authentically Neoplatonic principle of the priority of unity to multiplicity that leads Plotinus to the radicalization of the Aristotelian principle and the application of it to the ontological status of the One.

### 3. The Forms are not the Concepts of the Psyche

When the ontological principle is applied to the interweaving of the Psyche and the Forms, there arises an unfavorable tendency. In one of its application, Whitehead says, the principle "issues in the doctrine of 'conceptualism'" (PR 40/ 64). The preceding quotation from Descartes' *Meditation* that "every clear and distinct conception (*perceptio*) cannot derive its origin from what is nought" refers to a conceptualism in which a traditional causal principle is applied to the representational character of concepts. But Whitehead intends to develop the ontological principle in the

direction opposite to a more subjective kind of conceptualism, for instance, the critical philosophy of Kant, in which "the world emerges from the subject" (PR 88/135).

Insofar as the ontological principle has such a conceptualist tendency, the noetic realization of Forms in the Psyche as an exemplification of that principle is prone to invite a Middle-Platonic theory of Forms as God's concepts. Plotinus is also aware that his doctrine of the presence of Forms in Intellect is liable to be misunderstood in terms of the Middle-Platonic theory. He critically points out that, on the Middle-Platonic theory, Intellect is forced to hypostatize a Form by apprehending a concept which has not yet been existent (VI 6 [34], 6, 14-19).<sup>66</sup> In other words, that theory renders the Forms "arbitrary concepts without any substantial content of their own."<sup>67</sup>

Whitehead's denial of the hypostatization of eternal objects by the nontemporal actuality is worth considering. He rejects the creation of eternal objects by God, because God's nature *qua* actuality requires eternal objects *qua* potentialities in the same degree that the latter requires the former: "This is an exemplification of the coherence of the categoreal types of existence" (PR 257/392). I pointed out elsewhere that Plotinus' claim of interdependence of Intellect and Forms, too, is incompatible with the Middle-Platonic theory.<sup>68</sup> God's primordial existence is the act of complete valuation of eternal objects (PR 31/46, 247/378). Apart from the primordial forms of definiteness, hence, no existence of God is possible at all. The relationship of mutual requirement between God and eternal objects amounts to the one between being and definiteness, the two being distinguished from one another.<sup>69</sup> Whitehead would suggest that it is possible to avoid the tendency of the noetic realization of Forms toward the Middle-Platonic doctrine, by means of the relation of mutual requirement between the Psyche and the Forms. Moreover, if they need to be viewed in terms of being and definiteness, the basic picture of the complex consisting of them is very akin to that of the Plotinian intelligible world which consists of intelligible shapes and intelligible matter, the latter being endowed with some contemplative force.<sup>70</sup> The Psyche in abstraction from the Forms would be analogous to sheer intelligible matter. But, insofar as the Psyche is the non-temporal actuality, Plotinus' dictum that "the divine matter when it receives that which defines it has a defined

and intelligent life" (II 4 [12], 5, 15-16) must be inverted as follows; the Forms when they are entertained by the Psyche have an intelligent life. To this extent, the relation of mutual requirement between the Psyche and the Forms can be an analogue to Plotinus' notion of the definition of intelligible matter or the inchoate Intellect by intelligible shapes.

As Christian notes, the point of divergence of Platonic realism from Platonic idealism in Whitehead's system is whether or not the datum of the initial aim constituting the primary phase of a subject is something objective to that subject. Platonic realism admits the possibility of disconnection between the datum and the subjective form—*how* the subject feels the object—of God's primordial appetite.<sup>71</sup> Let us explicate Christian's remark. The data to God's primordial nature are the disjunctive multiplicity of all eternal objects (PR 87-88/134).<sup>72</sup> God's subjective forms are "valuations determining the relative relevance of eternal objects for each occasion of actuality" (PR 344/522).<sup>73</sup> It is by reason of the actuality of God's primordial valuation that "each eternal object has a definite, effective relevance to each concrescent process" (PR 40/64). Finally, "relevance" must express some real fact of togetherness among eternal objects (PR 32/48). In reference to eternal objects, therefore, the disconnection in question is between their disjunctive multiplicity simply given to God and their togetherness determined by him. If our metaphysics appeals to this point, we must say that interrelations among Forms are dependent on the basic Psyche's act of determining the relative relevance of Forms for each Psyche underlying the process of becoming. In other words, interrelations among Forms are not intrinsically fixed. Such a consequence is obviously at variance with the classical Platonic view that those interrelations are eternally decided. Do we then need to consider seriously this consequence? If we need to do so, what are its philosophical merits? These problems will be discussed in the next section.

#### 4. The Refusal of the Principle of Plenitude

In the last subsection we referred to "God's primordial appetite." What Whitehead calls "appetition" is an "urge towards realization of the datum conceptually prehended" (PR 32/47). The urge is always involved in God's contemplative act of eternal objects. He envisages them in their relevance for particular

actualization. This view would compel us, against Plotinus' will, to give some "demiurgic" implication to the presence of Forms in Intellect. The basic Psyche is responsible for adjusting the togetherness of Forms on which the cosmic order depends; for "the determinations of compatibilities and incompatibilities [for joint exemplification] are the key...to the understanding of the world in its function as the theatre for the temporal realization of ideas" (AI 147). Exactly in this sense, the noetic realization of Forms in the Psyche is given a "demiurgic" implication. The basic Psyche is hardly indifferent to the actual conditioning of the process of becoming.

The Psyche does not have an urge to realize all of the Forms physically at once. In Whitehead's words, the Divine Eros coupled with the basic Psyche is "the active entertainment of all ideals, with the urge to their finite realization, each in its due season" (AI 277). The finite realization is evidently the rejection of what Lovejoy terms "the principle of plenitude" or the "theorem of the 'fulness' of the realization of conceptual possibility in actuality," that "any eternal essences have temporal counterparts." On the principle, the universe is "a *plenum formarum* in which the range of conceivable diversity of *kinds* of living things is exhaustively exemplified."<sup>74</sup> The finite realization of Forms is precisely the case of the alternative to the principle of plenitude, proposing that "out of the whole range of the Ideas, only a limited selection have sensible embodiment."<sup>75</sup> Again, Christian finds Whitehead's notion of eternal objects as *pure* possibilities to be the refusal of that principle,<sup>76</sup> which is usually regarded as essential to Neoplatonism.<sup>77</sup> Therefore the objection will be naturally raised that the metaphysics under reconstruction might be anti-Neoplatonic. Our response to this objection is that the admission of the principle of plenitude cannot serve as a criterion for characterizing Neoplatonic philosophy. Let us touch upon the point of our reply briefly.

It is difficult to apply the principle of plenitude to the entire range of the world of Forms. The principle is formulated on *Timaeus* 41b-c, where we are told that the realm of Forms would be deficient if it did not contain all the kinds of *living being*. The realm, however, does not consist solely of the Forms of various living entities; Plato's "catholic" list of Forms includes not only the so-called substantival Forms but the so-called adjectival and verbal ones (*Epistle* VII, 342d-e). Therefore it is not warranted

even in Plato's thought to conclude "the *necessarily* complete translation of all the ideal possibilities into actuality"<sup>78</sup> from the conception of the physical universe as the *plenum formarum*. In other words, the principle of plenitude is applicable at best with regard to the specific Forms subsumed under the generic Form of Living Being, or the Forms mentioned in the cosmological context of the *Timaeus*. If the whole range of Forms were *necessarily* translated into physical actuality, there could not arise the problem of intermittent causation of Forms as pointed out by Aristotle.<sup>79</sup> Moreover, the Neoplatonic theory of emanation is often regarded as an exemplification of the principle of plenitude.<sup>80</sup> Indeed it is true to say that that which is indiscriminately and formlessly contained in the One is exhaustively articulated in the noetic world (V 5 [32], 6, 1-5). But Plotinus does not admit the fulness of the physical actualization of conceptual possibilities: "if one takes 'things in the sense-world' to mean 'things in the visible realm,' there are not only the things in the sense-world there [*sc.* in the intelligible world], but more" (V 9 [5], 13, 15-17, tr. A. H. Armstrong).<sup>81</sup> The rejection of the principle does not necessarily result in the divergence from Platonism or Neoplatonism.

The finiteness in the physical realization is not the result of imperfection. Whitehead notes that it "results from the fact that there are possibilities of harmony which either produce evil in joint realization, or are incapable of such conjunction" (AI 276). The notion of intrinsic incompatibility "has never been applied to ideals in Divine realization," though it "has an important bearing upon our conception of the nature of God" (AI 277). Our metaphysics may appeal to the principle of intrinsic incompatibility rather than to the principle of plenitude for the regulative principle of the physical realization of Forms. The principle of incompatibility, as Whitehead notes, precisely marks the viability of Plato's conception of connection and disconnection among Forms as discussed in the *Sophist*.

### III. The Forms as the Inexhaustible Domain of Possibility and the Neoplatonic One

Whitehead gives an account of the contemporary relevance of the Platonic Forms primarily in terms of connection and

disconnection among them. His insight that they are needed for an account of the emergence of novelty in the universe must be sufficiently exploited for our reconstructive undertaking. This suggested notion of the Forms would require a revision of the traditional conception of the intelligible world as a fixed order of immutable essences. In this section, we will clarify the necessary revision of the world of Forms. And then we will discuss whether or not our metaphysics is exigent of the Neoplatonic One.

### 1. The Forms as the Inexhaustible Domain of Possibility

Whitehead characterizes the universe as a creative advance into novelty. A novel feature must be given as a physically unrealized potentiality, without which we would obtain a static monistic universe. For the creative advance into novelty to be intelligible, some potentialities always remain physically unrealized, though realized in the non-temporal actuality. The advance definitely presupposes an inexhaustible domain of possibility, the boundless and unstructured infinity of togetherness of Forms.<sup>32</sup>

The inexhaustible domain of possibility radically revises the classical picture of the noetic cosmos as an intrinsically fixed realm of immutable essences. In the first place, Forms are unlimited in number.<sup>33</sup> Plotinus maintains that the original pattern consisting of a finite number of Forms can engender an infinite number of their sensible manifestations (V 7 [18], 1, 25-27; 3, 22-23).<sup>34</sup> But this thesis inescapably appeals to the Stoic doctrine of an infinite succession of world periods, and so is incompatible with the creative advance toward novelty. According to Syrianus, on the other hand, Amelius, as does St. Bonaventure, believes in an infinity of Forms which cannot all be reproduced in the finite universe, even in infinite time.<sup>35</sup> This enables him to renounce the theory of identical cosmic cycles.<sup>36</sup> Our metaphysics is willing to adopt Amelius' innovation which was not developed at all by ancient Neoplatonists.

In the second place, connection and disconnection among Forms are not intrinsically fixed. Because of the application of the ontological principle to the noetic realization of Forms, togetherness among Forms must be precisely togetherness in the formal constitution of the basic Psyche. A physically unrealized Form can be relevant to the temporal process only if it has some togetherness with physically realized ones. Thus the connection

between "the eternality of being" and "the fluency of becoming" by "the medium of activity" (AI 120) is secured by the real fact of togetherness among Forms within the basic Psyche.

It is the basic Psyche that orders the entire multiplicity of Forms. Apart from this ordering, in Whitehead's words,

there would be a complete disjunction of eternal objects in the temporal world. Novelty would be meaningless, and inconceivable (PR 40/64).

Forms, by themselves, are utterly unrelated to one another. Insofar as the relevance of a physically unrealized Form to the process of becoming calls for some relation to the Forms physically realized, the complete disjunction of Forms results in their physical unrealizability. Moreover, novelty which presupposes the physical realizability is conceivable only if Forms are not intrinsically ordered. If the domain of possibility consists of a finite number of Forms, whether or not their togetherness is intrinsically structured, it is exhausted so that novelty cannot be always insured. On the other hand, if an infinite number of Forms, as Amelius proposes, cannot all be physically realized even in unlimited time, novelty in a sense is safeguarded, even though their togetherness is eternally fixed. But the alternative that interrelation among Forms is immutably fixed allows no new combination of possibilities. What Whitehead means by "novelty" is not restricted to a mere emergence of some Forms physically unrealized. Novelty needs to be considered also in terms of compatibility and incompatibility among Forms. He writes:

In the nature of things there are no ultimate exclusions, expressive in logical terms. For if we extend the stretch of our attention throughout the passage of time, two entities which are inconsistent for occurrence on this planet during a certain day in the long past and are inconsistent during another day in more recent past—these two entities may be consistent when we embrace the whole period involved, one entity occurring during the earlier day, and the other during the later day. Thus inconsistency is relative to the abstraction involved (MT 54-55).

In short, the novelty under discussion denotes also an emergence of some new combination of Forms. With the proposal that

togetherness among Forms is dependent on the organizing act of the non-temporal Psyche, the notion of joint exemplification of Forms is drastically revised. Whereas the joint exemplification—for example, Snow and Coldness in the hypothesis argument of the *Phaedo*—is conceived solely in terms of the definite “blending” of the Forms involved in the ancient theory of Forms, it, as Christian remarks, must be strengthened by the qualification that a physical realization of one possibility “necessarily excludes the unbounded welter of contrary possibilities”<sup>87</sup> in our position. The consequence of this revision is the replacement of the traditional view that “the history of the Universe contains an infinite number of vast but finite schemes”<sup>88</sup> by Whitehead’s terse statement that “in process the finite possibilities of the universe travels towards their infinitude of realization” (MT 54).<sup>89</sup>

Our position does not admit a “realm” of Forms in the strong sense of the word. In the Psyche’s envisagement Forms constitute a realm only in the sense that they have ■ general togetherness.<sup>90</sup> Each Form has not only its unique individual essence, but a relational essence which indicates its reference to other Forms (SMW 159-160). As to the latter essence it must be noted that the relationships among Forms are internal relations (SMW 160).<sup>91</sup> The adequate notion of internal relation is that “just as the relations modify the natures of the relata, so the relata modify the nature of the relation” (AI 157). Hence the claim that togetherness among Forms is not intrinsically fixed is prone to entail the fear that the Psyche’s organizing activity may modify the nature of the Forms involved, and thereby their immutability may be compromised. But this fear can be dissolved by the distinction between individual and relational essences of Forms; in being reevaluated by the Psyche, they are modified—in Plato’s words, “acted upon”—in their relational essences, but not in their individual essences. On the dependence of Forms’ interrelations upon the organizing act of the Psyche, therefore, the defense of Forms’ immutability urgently calls for the distinction of the two essences of Forms, which is also a necessary revision of the classical theory of Forms.

The modifications in relational essences of Forms may drive us to several complicated problems. One of them is how these modifications are compatible with the non-temporality of the basic Psyche and the “eternality” of Forms; for the notion of modification seems to involve some temporality or duration. In speaking of

Intellect’s movement within the framework imposed by the notion of nondurational eternity, as Armstrong points out, Plotinus is confronted with a similar problem.<sup>92</sup>

## 2. The Neoplatonic One and the Whiteheadian Creativity

It is unquestionable that the transcendent One or Good is something essential to Neoplatonism. On our view of the interweaving of the Psyche and the Forms, are there still some exigencies to posit the Neoplatonic One? If there are, how does the ancient doctrine of the One have to be modified?

Our exploration of the possibility of rebuilding Neoplatonic metaphysics starts from the seven Platonic notions highlighted by Whitehead. But the transcendent Good is not included in them. We must consider exigencies of the One from another angle. The One is exactly something ultimate in Neoplatonism. According to Whitehead, every philosophical thought recognizes a metaphysical category of the ultimate, which is actual in virtue of its accidental embodiments; in his own philosophy of organism this ultimate is termed “creativity,” and in monistic philosophy “God” or “The Absolute” (PR 7/10-11). Creativity is a basic activity of self-creation generic to all individual actualities and conceived in abstraction from them.<sup>93</sup> It is “ultimate” in the senses that it constitutes the generic metaphysical character of all actualities and that the actualities are individualizations of it.<sup>94</sup> Indeed many students of Whitehead’s thought regard his notion of creativity as something enigmatic or elusive. In this paper I do not go into the widespread controversy regarding its role in his metaphysics. Nevertheless, his notion of creativity is worth considering in our effort to explore a proper conception of the One in our metaphysical scheme. “The category of the ultimate” in *Process and Reality* is demarcated from “categories of existence” under which both actual entities and eternal objects are subsumed. In thinking of something ultimate and distinct in categorical level from the Psyche and the Form, we may focus attention on the notion of creativity. The Plotinian One is the hyper-ontic, primordial activity which is instantiated in diverse individual intellects.<sup>95</sup> It would be reasonable to analogize the One to creativity.

In the subsequent discussion, the One analogized to creativity for our metaphysics is denominated “the creative One.”

Creativity is the ultimate principle whereby the disjunctively many become the one actuality: "It lies in the nature of things that the many enter into complex unity" (PR 21/31). This notion is exactly analogous to the One which insures the self-unification of the soul (VI 9 [9], 1, 42-43). Into our metaphysics the creative One may be introduced as the principle by which each Psyche not only unifies itself but is intrinsically related to other Psyches, bringing complex unity or internal relations to the physical world. It is the ultimate principle of self-unity of the actualities and internal relations among them. The role of the creative One as the self-creative and unificative activity generic to all actualities would certainly remind us of Plotinus' ontological use of *συναίσθησις*, the most basic term for consciousness in his psychology. Applied to every level in his ontological hierarchy, the term implies "the essential unity of an entity, that moment when it is most complete in itself and, simultaneously, transcendent cause of what comes after it."<sup>96</sup> The One's *οἶον συναίσθησις* whereby its *κατνόησις* is the One itself (V 4 [7], 2, 17-18)<sup>97</sup> represents the activity of unification in the highest degree. Again, he defines intellection as *συναίσθησις τοῦ ὅλου* (V 3 [49], 13, 12-13),<sup>98</sup> which turns "inward unifying its own interior multiplicity."<sup>99</sup> The basic Psyche's activity is akin to *συναίσθησις* of Intellect, unifying the unordered multiplicity of Forms into their togetherness.

Whereas we purport to analogize creativity to the One, Whitehead himself analogizes it to Aristotelian matter because of its characterlessness (PR 31/46-47). In his comparative study of Plotinus and Whitehead, Rodier follows this line of analogy and points out the resemblance between the metaphysical functions of creativity and of the Plotinian matter; they are both responsible for the ongoingness of the universe.<sup>100</sup> But our viewpoint of analogy differs from Rodier's, since we regard Psyches as actualities instantiating creativity. We are reluctant to consider the Receptacle, which corresponds to the Plotinian matter, in our metaphysics as responsible for the ongoingness of the universe.<sup>101</sup> Also with regard to its indeterminacy, creativity can be easily compared with the Plotinian One.

Moreover, creativity is defined as the principle of novelty, endlessly producing novel actualities by a process of self-creation (PR 21/31-32). Christian maintains that creativity and the theory of an infinite and unordered multiplicity of eternal objects require

each other in Whitehead's system. For the infinite and unordered multiplicity of eternal objects to be physically realized, on the one hand, novel actualities must be produced endlessly. On the other, this endless production of novel actualities is logically possible only if the realm of eternal objects constitutes an inexhaustible domain of possibility.<sup>102</sup> Since the Whiteheadian theory of atomicity of actuality is not adopted in our metaphysics, we need to consider the principle of novelty from another angle. In our position, novelty primarily means an emergence of the Forms and their combinations, physically unrealized, to the physical world. On our narrower notion of novelty that does not denote the production of novel actualities, the creative One can serve as the principle of novelty in two ways. In the first place, the creative One incessantly underlies finite, temporal actualities or souls of varying grades, as well as the basic Psyche, so that the unending physical realization of the inexhaustible domain of possibility is carried on by them. In the second place, the creative One is always instantiated by the non-temporal actuality or the basic Psyche, so that it perpetually realizes an infinitude of Forms in itself. Apart from this realization, novelty is inconceivable. Insofar as the classical notion of the fixed realm of Forms must be replaced by the infinite and unordered multiplicity of Forms which are to be organized by the non-temporal actuality, the physical realization of them and the unending sustenance of actualities by the creative One must require each other.

It must be noticed that this unending sustenance of actualities by the creative One renders the Neoplatonic doctrine of "undiminished giving,"<sup>103</sup> which goes back to *Timaeus* 42e.<sup>104</sup> The doctrine of undiminished giving does not attempt to explain the creative advance of the universe into novelty. On the contrary, the notion of the creative One would revitalize that doctrine as an insight which is required by the physical realization of the inexhaustible domain of possibility and appeals to our experience of the emergence of novel features in the world. In addition, Plotinus maintains that the immortality of Intellect and souls is based on the undiminished power of the One (IV 4 [22], 10, 22-30). Since the creative One is the basic activity of self-creation generic to all individual actualities, each of them exemplifies the generic metaphysical characteristic of the creative One and therefore is describable as an instance of self-creative activity. In the first

section, it was pointed out that the significance of Plato's definition of the Psyche as the self-mover consists in its avoidance of the static fallacy involved in the Aristotelian substance-quality metaphysics. The status of each Psyche as an instance of self-creative activity leads to the revision of his definition; sustained perpetually by the creative One, every Psyche endlessly continues to create itself. This endless self-creation results in the replacement of the Aristotelian substance by the creative One (cf. PR 21/32) and, if we invoke Plato's argument in the *Phaedrus* and the *Laws*, in the Psyche's immortality. The creative One thus exactly renders the Platonic and Neoplatonic point of view. Moreover, Leclerc notes that Whitehead's category of creativity replaces Aristotle's matter<sup>105</sup> viewed as something ultimate in the notion of simple location. It is the creative One that gives a *coup de grâce* to scientific materialism.

Although creativity is not explicitly included in the seven Platonic notions, it is rendered by the Eros to some extent. Conceived as "the urge towards ideal perfection," the Eros is sublimated into "the notion of the soul in the enjoyment of its *creative* function, arising from its entertainment of ideas" (AI 148, *Italics mine.*). The Eros urges the Psyche to create a new fact woven out of the old and the new, so that, if we omit both of them, "we should obtain a static world" (AI 275). Whitehead defines the very essence of real actuality as process (AI 274): "the process is its absorption into a new unity with ideals and with anticipation, by the operation of *creative Eros*" (AI 276, *Italics mine.*) It is evident that the Eros assumes the roles of creativity as the ultimate principle by which the many become the one and as the principle of novelty. Although we have regarded each Psyche as an instantiation of the creative One, we must now correctly say that the creative One is individualized by every Psyche with its indwelling Eros.<sup>106</sup>

How is the creative One related to Forms? Whitehead nowhere states that eternal objects are derived from creativity. The following passage in *Science and the Modern World*, where creativity is referred to as "the general activity," requires serious consideration:

The general activity is not an entity in the sense in which occasions or eternal objects are entities. It is a general metaphysical character which underlies all occasions, in a particular mode for each occasion. There is nothing with which to compare it: it is Spinoza's one infinite substance. Its attributes are its character of individualization

into a multiplicity of modes, and the realm of eternal objects which are variously synthesized in these modes. Thus eternal possibility and modal differentiation into individual multiplicity are the attributes of the one substance. In fact each general element of the metaphysical situation is an attribute of the substantial activity (SMW 177).

The first sentence clearly prefigures the distinction between the categories of the ultimate and of existence in *Process and Reality*. While creativity is not described as a "substantial activity" in *Process and Reality*, such a description, with the comparison of creativity with Spinoza's infinite substance, insinuates that it is somehow more real than actualities.<sup>107</sup> Then, how should we understand the statement that the realm of eternal objects is attributes of creativity? Does it mean that each eternal object instantiates creativity as does each actuality? We must also seriously take the comparison with Spinoza's infinite substance into consideration. Insofar as Whitehead is critical about the substance-quality metaphysics, his comparison must not be taken literally. Nevertheless, the realm of eternal objects can be suitably analogized to attributes of creativity, in that the infinitude of possibilities constituted by that realm expresses the boundlessness of creativity.<sup>108</sup> In addition, Whitehead's comparison would allure us into the conception of creativity as a kind of *natura naturans*.<sup>109</sup> But we must not form the hasty conclusion that the "existence" of Forms may be dependent on or derived from the creative One.

As for Whitehead's analogy of creativity to Spinoza's infinite substance, Leclerc gives an instructive suggestion. In considering Whitehead's analogy, he invokes H. F. Hallett's characterization of Spinoza's infinite substance as an eternal potency-in-act actualizing itself in determinate modes.<sup>110</sup> The one substance is called the "potency-in-act" because the modes are the enaction of the eternal act, the actualization of the eternal potency. For Whitehead the Spinozistic modes become the finite, determinate actualities, which are the actualizations of creativity or a primordial indeterminate potency-in-act. But he does not agree with Spinoza in holding that this ultimate creative potency-in-act is not an actual entity or a substance, an οὐσία. On the other hand, its actualizations are οὐσίαι.

The characterization of creativity as the primordial potency-in-act may be taken seriously for our conception of the nature of the creative One. The creative One is something neutral

to actuality and possibility, so that it is expected to take a role of mediating the Forms and the basic Psyche. On the ontological principle, togetherness among Forms must be referred to some actuality. Here we may raise a rather basic question. Why is it that the disjunction of Forms primordially obtains the conjunction of noetic realization by virtue of the actuality? It does not lie in the notion of actuality *as such* that the many enter into complex unity. An answer to this question can be given by an appeal to creativity.<sup>11</sup> The reason why the disjunctive multiplicity of Forms is organized into their efficient conjunction is that the basic Psyche is an instantiation of the creative One by which the many become the one actuality. The basic Psyche and the Forms are metaphysically mediated by this instantiation of the creative One, in the Psyche, by which alone the disjunctive multiplicity of Forms can enter into complex unity. If the Psyche were not an individualization of the creative One, Forms would eternally remain isolated from one another. Whitehead regards a mere isolation of Forms as "indistinguishable from nonentity" (PR 257/392).<sup>12</sup> From his analogy of creativity and eternal objects to Spinoza's substance and its attributes, we are reluctant to conclude that the existence of eternal objects is derived from creativity. To the extent that the instantiation of the creative One in the basic Psyche keeps Forms away from "mere isolation indistinguishable from nonentity," we can say that the "being (τὸ εἶναι)" of Forms is a consequence of this instantiation. The metaphysical relation between the creative One and the Forms, of course, requires much more inquiry. The above suggestion would support our attempt to conceive the nature of the One in its analogy to creativity; for the creative One carries out the roles to mediate the Psyche and the Forms and to provide the Forms with "being," the roles which Plato gives to the transcendent Good in the metaphor of the sun (*Republic* 507e-509b).

The characterization of Spinoza's substance as the indeterminate potency-in-act goes well with Whitehead's own conception of creativity. Creativity is the "boundless, abstract possibility" limited by each actuality (PR 220/336-337). The status of the Plotinian One as the hyper-ontic activity is a consequence of the radicalization of the Aristotelian principle. Then, how can our analogy of the One to creativity be consistent with the status of the Plotinian One? Notice that the term ἐνέργεια for Plotinus is never

univocal. Intellect's actuality is an actualization of its hypostasis, and intellection is an activity of Intellect. On the other hand, if the One's actuality were an actualization of something, its absolute simplicity would be compromised so that it would be placed on the level of Intellect.<sup>13</sup> The ἐνέργεια in the sense of an actualization of something is definitely denied to the One.<sup>14</sup> The One's actuality is simply an activity totally undifferentiated from itself. In Whitehead, an actuality always denotes an actual entity. The Psyche in our metaphysics is an actual entity, an actualization of the creative potency-in-act. Creativity for Whitehead is not an actual entity. Yet he sometimes calls it an "activity," that is, the basic activity of self-creation generic to all individual actualities. Likewise in our metaphysics, the creative One must be called the hyper-ontic activity or potency-in-act. As for the status of the creative One, however, we do not appeal to the ontological principle in *any* version.<sup>15</sup> In this respect, we assuredly diverge from Plotinus.

Finally, we are confronted with a serious problem concerning the transcendence of the creative One. Whitehead maintains that creativity is always found under its individual embodiments; it is not a transcendent "creator" creating actualities. The comparison of creativity with Spinoza's substance implies that it is an immanent principle of self-creation. Here Whitehead's Platonism and Plotinus' Neoplatonism, as Rodier points out,<sup>16</sup> would be sharply contrasted. Yet Whitehead remarks, at the end of his account of creativity, that "[the] sole appeal is to intuition" (PR 22/32). We are allowed to appeal to our own intuition in knowing what the creative One is. "Intuition (ἐπιβολὴ ἀθρόα)" (III 8 [30], 9, 21-22) to which Plotinus appeals in knowing what the One is really includes mystic intuition. Even if our appeal to intuition tells a bare, transcendent activity not conditioned by any actuality, we are compelled to meet various problems which the notion of the transcendent activity may invite. Those problems to be seriously worked out in our metaphysics are totally beyond the scope of this paper. But the following point must be noticed. Our discussion about the analogy of the One to creativity surely satisfies the minimum requirement for the transcendence of the creative One; the creative One does not fall under the categories of existence. It is neither an actual entity nor a Platonic Form. This is the minimum requirement, precisely because Plato's statement in *Republic*

509b—the *locus classicus* for the transcendence of the Neoplatonic One—is so brief as to remark simply that the Good is not real being, but beyond it in dignity and power. From this brief statement starts Plotinus' elaborate doctrine of the One. Having satisfied the requirement, we are sharing the initial step toward the transcendent One with Plotinus. Our metaphysics, too, newly starts from *Republic* 509b and is expected to put a novel "series of footnotes" to that *locus classicus*.<sup>17</sup>

#### IV. Epilogue

The above discussion is a mere contour of a Neoplatonic metaphysics we propose to reconstruct; the Platonic notions other than the Psyche, the Eros, the Forms, and the Receptacle have been left unconsidered. Whitehead strongly convinces that it is our task to rebuild such a world view that we are now struggling to obtain:

The mere compulsion of tradition has lost its force. It is our business...to re-create and reenact a vision of the world, including those elements of reverence and order without which society lapses into riot, and penetrated through and through with unflinching rationality. Such a vision is the knowledge which Plato identified with virtue (AI 99).

This type of philosophical vision of the world is unmistakably a virtue, since its "gifts are insight and foresight, and a sense of the worth of life, in short, that sense of importance which nerves all civilized effort" (AI 98). It is in the civilized world of today that this kind of vision is sought after; for "when civilization culminates, the absence of a coordinating philosophy of life, spread throughout the community, spells decadence, boredom, and the slackening of effort" (AI 98). Anyway our ambitious business has just been begun.<sup>18</sup>

3. A. N. Whitehead, *Adventures of Ideas* (New York: The Free Press, 1967), pp. 146-147. Hereafter the following abbreviations of titles and the editions of Whitehead's works are used for reference:
 

AI	<i>Adventures of Ideas</i> (New York: The Free Press, 1967).
FR	<i>The Function of Reason</i> (Princeton: Princeton University Press, 1929).
MT	<i>Modes of Thought</i> (New York: The Free Press, 1968).
PR	<i>Process and Reality</i> , edited by D. R. Griffin and D. W. Sherburne (New York: The Free Press, 1978).
SMW	<i>Science and the Modern World</i> (New York: The Free Press, 1967).
- With regard to PR, page numbers following a slash refer to the 1929 Macmillan edition.
4. For the nature of metaphysics, see PR 3/4, 116/178; AI 222.
5. Needless to say, one of the most prominent features of Neoplatonic metaphysics is the One beyond the Forms. Whitehead's position is uncertain about the Platonic Idea of the Good or the Neoplatonic One. He neither reckons the Good among the basic notions as an independent one nor categorizes it into the notion of the Ideas.
6. Giuseppe Martano's description of the comprehensive nature of Proclus' philosophy (*Proclo di Atene*, 2nd ed. [Naple: Giannini, 1974], pp. v-vi) would be to some extent applicable also to Plotinus' philosophy. It certainly indicates the direction in which our reconstruction of Neoplatonism must steer. Whitehead, too, maintains that "the purpose of philosophy is to rationalize mysticism" (MT 174).
7. See also SMW 17; PR 70-71/108-111.
8. See also AI 156; MT 139.

9. MT 138: "The concept of matter presupposed simple location. Each bit of matter was self-contained, localized in a region with a passive, static network of spatial relations, entwined in a uniform relational system from infinity to infinity and from eternity to eternity." See also SMW 17; AI 156-157; PR 309/471.
10. See also MT 134.
11. See also SMW 57-58; PR 209/319.
12. PR 30/45, 79/122, 158/240; AI 132, 276.
13. W. A. Christian, *An Interpretation of Whitehead's Metaphysics* (New Haven: Yale University Press, 1959), pp. 106-111. See also I. Leclerc, *Whitehead's Metaphysics* (Bloomington, London: Indiana University Press, 1958), pp. 63-67, 116-119.
14. Whitehead regards as fallacious the notion of a point in process, which implies that "process can be analyzed into compositions of final realities, themselves devoid of process" (MT 96). Leclerc views this possibility of analysis as the doctrine of the unchanging subject of change (*Whitehead's Metaphysics*, p. 64).
15. The immanence of the cause in the effect, too, is an internal relation (AI 157). Leclerc mentions a significant view of the twentieth-century physics that all interaction between the particles involves the gain or loss of energy, understood as an internal ingredient of the particles (*Whitehead's Metaphysics*, p. 118, n. 2).
16. See also PR 79/122. For the "living" elements of the traditional notion of substance in Whitehead's thought, see W. A. Christian, *An Interpretation*, pp. 111-115.
17. For the linkage of the two fallacies, see AI 276.
18. See also MT 136: "The whole spatial universe is...a field of incessant activity."
19. The view of nature as a theater for interrelations of activities is also the basic character of Whitehead's own philosophy of organism. One of the metaphysical principles in his philosophy is that "the very essence of real actuality...is process" (AI 274). Again, the interrelatedness of activities points to the solidarity of the universe, the fundamental thesis of his philosophy: "every item of the universe, including all the other actual entities, is a constituent in the constitution of any one actual entity" (PR 148/224). It is generalized in MT 66: "...each entity, of whatever type, essentially involves its own connection with the universe of other things." For the formulation of the thesis in terms of internal relations, see J. L. Nobb, *Whitehead's Metaphysics of Extension and Solidarity* (Albany: State University of New York Press, 1986), p. 1. To the elucidation of

- interconnectedness of actualities the philosophy of organism is devoted (PR xii/vii, 7/10, 50/79-80; AI 228; MT 66, 140). Hence it is set in contrast with the philosophy of substance (PR 151/228, 205/311).
20. *Phaedrus* 245c-246a; *Laws* 895e-896b, 966e.
21. IV 7 [2], 9, 6-7; 12, 4. See also V 1 [10], 2, 1-27.
22. The universe is conceived to be dynamic process also in the *Timaeus*. For the analogy of the Whiteheadian actual entity to the process of becoming and perishing in *Timaeus* 28a, see PR 82/126.
23. For Plotinus' rejection of a static substance as the subject of change, see VI 3 [44], 2, 1-4. For the nature of body as continual flux, see also II 1 [40], 2, 5-6; IV 3 [27], 8, 24-27; 26, 53-54; IV 7 [2], 3, 19; 8, 45; V 6 [24], 6, 15-16.  
For the thesis that everything aspires to contemplate, see III 8 [30], 1, 1-7; 1, 18-21. For the earth's perception, see IV 4 [28], 26, 5ff.
24. In SMW 101-102 Whitehead points out that in the nineteenth century the notion of energy becomes fundamental and displaces matter from its unique preeminence, endangering the adequacy of scientific materialism.
25. G. M. Gurtler, *The Experience of Unity*, p. 116.
26. See 32, 47-48: "...it was not possible for all the individual things to be as if they were alone." See also VI 7 [38], 2, 30-36. Gurtler notes: "Absolute autonomy or individuality would indeed make little sense in Plotinus" ("Sympathy in Plotinus," *International Philosophical Quarterly* 24 (1984): 403).
27. Gurtler here finds out two foci of sympathy: (i) the comprehensive unity of the universe as a whole and (ii) the particular sympathy operative between its different parts (*The Experience of Unity*, p. 112). For the connection between the Platonic conception of the universe and the Plotinian cosmic sympathy, see also IV 4 [28], 35, 8-9.
28. See also IV 4 [28], 23, 19-28; IV 5 [29], 1, 34-40; 2, 16ff.; 8, 1-7.
29. IV 4 [28], 26, 1-4; 40, 1-4; 41, 1-9; IV 9 [8], 3, 4-6.
30. For the possibility of considering the problem of other minds with recourse to sympathy among souls, see G. M. Gurtler, *The Experience of Unity*, p. 93; *idem*, *International Philosophical Quarterly* 24 (1984): 406. On the contrary, Paul Henry believes that despite his adoption of sympathy, man is for Plotinus an isolated monad ("The Place of Plotinus in the History of Thought," in *Plotinus, The Enneads*, tr. S. MacKenna, revised by B. S. Page, 3rd ed. [London: Faber & Faber, 1962], p. xxxix). See also É. Bréhier, *The Philosophy of Plotinus*, p. 5.

At the section named "The Flux of Energy" in the eleventh chapter of AI, Whitehead claims that the contrasted aspects of nature, continuity and atomicity, are both indispensable and, in their modern phase, relevant to the present stage of science. Continuity is represented by a flux of energy with a quantitative flow and a definite direction, while atomicity by the nature of electrons, protons, and photons as unit charges of electricity and the quanta of the flux of energy (AI 185-186). These aspects, of course, are sufficiently considered in his notion of actual occasion. Also in Plotinus' doctrine of sympathy, as Gurtler notes, the individuality of each member of a unitary whole and the basic unity among members are well balanced (*The Experience of Unity*, p. 112; *International Philosophical Quarterly* 24 (1984):398). This parallel would certainly support our attempt to reevaluate Plotinus' doctrine of sympathy from the Whiteheadian perspective.

For our present inquiry we should not overlook D. F. T. Rodier's illuminating paper, "The Problem of Ordered Chaos in Whitehead and Plotinus," in *The Significance of Neoplatonism*, ed. R. B. Harris (Norfolk: International Society for Neoplatonic Studies, 1976), pp. 301-317. He views that Whitehead's theory of non-statistical probability is an expression of the same philosophical concern as Plotinus' account of sympathy. The concept of simple location involves great difficulties for induction (SMW 151). Whitehead endeavors to defend the possibility of induction on the basis of his metaphysics. Non-statistical probability is supported by two factors. First, any actual occasion belonging to an assigned species requires its past environment adapted to that species. Second, the directionality of each actual occasion toward novelty is derived from the primordial nature of God (PR 206-207/314-315). If we attempt to revise Plotinus' doctrine of sympathy by exploiting this suggestion, we are recommended to ground sympathy on both the interconnection among Forms and "the Soul entertaining ideas" (AI 275), rather than on the cosmic soul alone. In other words, the revision calls for the interweaving of the Psyche and the Forms.

In addition, Rodier explicitly maintains that "Plotinus is asserting that each part of the universe is related to each other part in terms of its own internal structure" (*op. cit.*, p. 309). This view is no doubt encouraging to our philosophical concern. He finds Plotinus' distinction between internal and external relations in IV 4 [28], 11, 1-7 (*ibid.*). See also note 26.

31. The eternal objects are modeled on the Platonic Forms (PR 44/70).  
32. See also W. A. Christian, *An Interpretation*, p. 252.

33. The eternal objects also insure the aesthetic values of nature (SMW 87-88). The role of the Forms must not be confined solely to cosmology.  
34. The "eternality" of Forms further implies their identity and immutability over time among their diverse temporal embodiments (SMW 86-87).  
35. I. Leclerc, *Whitehead's Metaphysics*, p. 98; W. A. Christian, *An Interpretation*, p. 197.  
36. F. M. Cornford, *Plato's Cosmology* (London: Routledge & Kegan Paul, 1937), pp. 183-184.  
37. Whitehead presents no comprehensive classification of eternal objects. For his suggestion of several examples, see PR 52/82. See also W. A. Christian, *An Interpretation*, pp. 202-203. For his admission of secondary qualities, see AI 293: "The appearance will...not [be] an importation of qualities and relations without any corresponding exemplification in the reality." For Plato's comprehensive list of Forms, see *Epistle VII*, 342d.

As to the extent of Forms Plotinus' position is slightly subtle. Wagner claims that Plotinus is not a naive realist; sensible qualities for him are in general accidents of the soul's products, so that they do not belong among the items carried down from the intelligible world. The intelligible world, which does not contain naive realist Forms such as Justice and Goodness, can be absolutely determinate and without contrariety, and therefore provides a foundation for science. See M. F. Wagner, "Realism and the Foundations of Science in Plotinus," *Ancient Philosophy* 5 (1985): 269-292. I do not share this view. Indeed Plotinus holds that sensible qualities are only affections ( $\pi\acute{\alpha}\theta\eta$ ) of underlying substances and do not reveal to us the reality of what underlies sensible appearance (II 6 [17], 1, 40-49; VI 2 [43], 14, 17-18). But it is not warranted to jump from this view to the conclusion that the intelligible world contains no adjectival Forms. In II 6 [17], 1, 13-15 Plotinus admits that the qualities in the noetic realm are *differentiae* of substance. In V 9 [5], 10, 6-9, we are told that there are "harmonious qualities" in the intelligible world. All qualities have been seen in that world (VI 2 [43], 21, 44-53). It is not impossible to regard the qualities in discussion as *differentiae*, though Wagner does not envisage this alternative. But it would be rash to limit the range of the adjectival Forms solely to the *differentiae*. There are two noteworthy passages. In VI 7 [38], 12, 23-30, Plotinus exquisitely depicts the intelligible world as one quality that holds and keeps all the qualities in itself. Although it would be possible to take this passage as a mere metaphor, the second passage cannot be treated as a metaphor. In

III 6 [26], 17, 22-25 Plotinus, abiding by *Timaeus* 52a, maintains that the color and other sensible qualities are named after their intelligible archetypes; the archetypes of certain sensible qualities must be posited as the Forms. Therefore, I believe, Wagner's attempt to show that Plotinus is not a naive realist is not successful enough. The extent of the Forms in the Plotinian noetic world is reserved for fuller consideration at another occasion.

I would like to make two more comments on Wagner's paper. In the first place, he is inclined toward an idealist interpretation of the relation between Intellect and Forms, regarding Forms as the outward images of Intellect's simple, inner act of self-determination (*op. cit.*: 280-285). This view is misleading, because it forces Intellect to contemplate its outward images and thereby is very likely to be deceived. For Plotinus' endeavor to avoid the Middle-Platonic conception of Forms as God's thoughts, see my "The One's Knowledge in Plotinus," (Ph.D. dissertation, Loyola University of Chicago, 1993), pp. 124-126. In the second place, the significance of the intelligible world for him cannot be exhausted by it being the foundation for science. Incidentally, Gurtler remarks that an explanation of the One "comes at the end of a long and critical examination beginning with human experience and tracing out the necessary conditions that make such experience possible" ("Plotinus and the Platonic *Parmenides*," *International Philosophical Quarterly* 32 (1992): 457). This remark would be surely applicable to Intellect lying in the midway of the "long and critical examination." Hence the intelligible world must be a part of a metaphysical system in terms of which every item of our experience can be interpreted. It must be the foundation, not only for science, but for ethics, religious and aesthetic experiences. The extent of Forms needs to be considered in such a wide context.

On the atomic conception of actuality, the Forms make a contribution to the dissolution of the substance-quality metaphysics in another way. To generalize, the influence of the past on the present requires for its intelligibility the existence of entities which can be multiply instantiated. The part of the Forms required for interrelatedness in causation is called a "relational function" (SMW 103; PR 58/91, 164/249, 238/364, 291/445-446; AI 183; MT 100). See also W. A. Christian, *An Interpretation*, pp. 139-140, 217. Although the relational functions of the Forms can cope with the isolation fallacy, our metaphysics does not adopt the atomic theory of actuality and is reluctant to appeal to the relational functions.

38. Whitehead's notion of "ingression" of an eternal object in an actual entity is certainly modeled on the verb εἰσιέναι employed at the Receptacle passage of the *Timaeus* (50cl, 3, 4).  
Taylor notes that there is "an almost absolute equivalence" of the Receptacle with "passage"—the condition of only "events" and no "objects" ingredient in them—in Whitehead's early works such as *The Principles of Natural Knowledge* and *The Concept of Nature*. See A. E. Taylor, *Plato: The Man and His Work* (London: Methuen, 1926; reprint ed., Cleveland: Meridian Books, 1956), p. 456, n. 1. Keeping in mind that "objects" are the ancestors of eternal objects and "events" those of actual entities, we cannot but doubt whether or not the equivalence is "almost absolute."
39. See also AI 150, 154, 187, 201, 275.
40. For Whitehead's allusion to this section, see AI 134, 150.  
Whitehead does not fully explain why the Receptacle can be the medium of intercommunication. For the revision of his theory of the metaphysical continuum of extension for grounding the mutual immanence of actual occasions, see J. L. Nobo, *Extension and Solidarity*, pp. 207-231, 348.
41. For the distinction between "being actually existent" and "being actuality," see 3, 2-3.
42. This rejection is inseparably linked with Whitehead's criticism of the Platonic Forms as a kind of self-sustaining actuality. See note 35.
43. The following sketch of Fujisawa's interpretation of Plato is based on his "Ἐχειν, Μετέχειν and Idioms of 'Paradeigmatism' in Plato's Theory of Forms," *Phronesis* 19 (1974): 49-56.
44. By the symbols, Φ, F, x, we respectively refer to the separate Form, the immanent character, and the individual thing which participates in the Form and has the character. As to the use of them I follow the examples of Vlastos. See G. Vlastos, "Reasons and Causes in the *Phaedo*," in *Plato I*, ed. G. Vlastos, (New York: Doubleday Anchor Books, 1970), pp. 132-136. The symbol "F" will be used indiscriminately for both the character and the corresponding predicate.
45. For the disappearance of participation terminology in later dialogues, see R. D. Archer-Hind, *The Timaeus of Plato*, edited with Introduction and Notes (New York: Macmillan, 1888; reprint ed., New York: Arno Press, 1973), p. 182; H. Cherniss, "The Relation of the *Timaeus* to Plato's Later Dialogues," in *Studies in Plato's Metaphysics*, ed. R. E. Allen (London: Routledge & Kegan Paul, 1965), pp. 362-364; W. D. Ross, *Plato's Theory of Ideas* (Oxford: Clarendon Press, 1951; reprint ed., Westport, Conn.: Greenwood Press, 1976), p. 230.

It must be noted that in the *Timaeus* the adjectival Forms and their images are treated on the same footing as the substantial Forms and their images. See *Timaeus* 51a6 with F. M. Cornford's note in his *Plato's Cosmology*, p. 186, n. 3 and N. Fujisawa, *Phronesis* 19 (1974): 54, n. 64.

46. N. Fujisawa, *Phronesis* 19 (1974): 56.

47. I cannot subscribe to Whitehead's observation that Plato is an adherent to substance-quality metaphysics (PR 137/209).

In addition, Whitehead seems to take "ingression" and "participation" almost synonymously (PR 39-40/63). This point would insinuate his possible supposition that participation terminology for describing phenomena is still viable in the *Timaeus*, in other words, the fact that he is not fully aware of the philosophical disadvantages of that terminology.

48. According to Fujisawa, Aristotle's application of the term "the participant" to the Receptacle in *Physics* 209b11-13 and 15 would show that he is led, by his basic metaphysics, to reintroduce into Plato's conception of the Receptacle "this something" as the subject-substrate; the statement, "The Receptacle participates in the Form," is an unwarranted, non-Platonic locution. See N. Fujisawa, *Phronesis* 19 (1974): 55-56; W. D. Ross, *Aristotle's Physics*, Revised Text with Introduction and Commentary (Oxford: Clarendon Press, 1936), pp. 565-566.

From this viewpoint, Plotinus' position concerning sensible matter, *prima facie*, would be essentially non-Platonic. In his own position it is matter that participates in Forms (VI 5 [23], 8, 1-2; III 6 [26], 11, 4-8; 11, 31-43). Does this imply that he introduces into his conception of matter the Aristotelian self-subsisting entity? The answer is negative. "Matter's participation in Form" seems to be simply a *façon de parler*; "participation" would imply no more than a causal dependence, and the syntactical structure of the participation locution is not considered. In VI 5 [23], 8, Plotinus repeats that what matter receives is not the Form itself but its likeness. Fujisawa points out that while employing such expressions as "receive (δέχεσθαι)" and "come into (εἰσέναι, ἐγγίγνεσθαι)" in the *Timaeus*, Plato is emphatic in asserting that what comes into the Receptacle is not the Form itself but its image (*Phronesis* 19 (1974): 55). Hence Plotinus in VI 5 [23], 8 faithfully abides by the spirit of that dialogue; he, I believe, is misled neither by Aristotle's characterization of the Receptacle as the participant nor by *Timaeus* 51a7-b1 μεταλαμβάνον δὲ... τοῦ νοητοῦ, the phrase which is often misconstrued to be an evidence of the use of "participation in the Form" in the later dialogues. (Proclus made this misinterpretation [*In Parm.* col. 876. 34-35].)

In exploring the significance of the Receptacle in relation to the logic of Paradigmatism, therefore, we may rely primarily on suggestions from the *Timaeus* and temporarily shelve Plotinus' theory of "matter's participation in the Form."

49. For the Whiteheadian counterpart of the first thesis, see PR 39/63; SMW 158.

50. For the Whiteheadian counterpart of the second thesis, see PR 40/63-64.

51. See also F. M. Cornford, *Plato and Parmenides* (London: Routledge & Kegan Paul, 1937), p. 100.

52. See my "The Omnipresence of Being: An Essay on the Dispute about Indian Influences on Plotinus," in *Neoplatonism and Indian Philosophy: Being, Becoming, and Knowing*, ed. P. M. Gregorios (Albany: State University of New York Press, forthcoming); and "The One's Knowledge," pp. 113-118, 127-128.

The similar point is never overlooked in Whitehead's own position. The relation between an eternal object and an actual entity is internal as regards the latter, but external as regards the former (SMW 160). The self-identity of eternal objects is not dependent on the flux of things (SMW 151).

53. Referring to *Timaeus* 37a, some critics view that the intellect-intelligible unity was maintained, though in an obscure and dispersed fashion, by Plato himself. See J. Pépin, "Éléments pour une histoire de la relation entre l'intelligence et l'intelligible chez Plotin et dans le Néoplatonisme," *Revue Philosophique de la France et de l'Étranger* 146 (1956): 40-44; R. D. Archer-Hind, *The Timaeus of Plato*, p. 115. For my objection to this view, see "The One's Knowledge," pp. 94-95, n. 45 to Chapter II of Part I; and "Plotinus on *Phaedrus* 247D7-E1: The Platonic *Locus Classicus* of the Identity of Intellect with the Intelligible Objects," *American Catholic Philosophical Quarterly* 71 (1997): 409-410.

54. The following sketch of Whitehead's exegesis of the *Sophist* is based on AI 119-121.

55. Plato himself, however, is not committed to this criterion. See my "The One's Knowledge," pp. 49-50, n. 50 to Chapter I of Part I. Plotinus also refuses to apply the criterion to the intelligible entities (III 6 [26], 6, 34-38).

56. It seems to me that Whitehead crucially deviates from Plato's own intention in his observation that the criterion of being applies to true being so that Forms are acted upon in being known. For more detailed analysis of the defense of the theory of Forms in the *Sophist*, see my "The One's Knowledge," pp. 24-34.

57. See A. Sumi, "The One's Knowledge," pp. 113-118.

58. A. H. Armstrong, "The Background of the Doctrine 'That the Intelligibles are not outside the Intellect,'" in *Les Sources de Plotin* (Geneva, Vandoevres: Foundation Hardt, 1957), pp. 400-401.
  59. R. Hackforth, *Plato's Phaedo*, Translated with an Introduction and Commentary (Cambridge: Cambridge University Press, 1955), pp. 144-145. See also Aristotle, *Metaphysics* 988a8-11, 991b3-5; *On Generation and Corruption* 335b7ff.. For Aristotle's characterization of the Platonic Forms as "potentialities," see *Metaphysics* 1050b34-1051a2.
- Whitehead is critical about Plato's conception of Forms as a kind of self-sustaining actuality (see note 35). Indeed the description of the realm of Forms as the Living Being in the *Timaeus* and the causal theory of Forms in the *Phaedo* invite the absorption of actuality to Forms. The inconsistency between the self-sustaining, actual Forms and the Forms devoid of efficacy would be one of the reasons why Whitehead considers Plato to be "never entirely self-consistent, and rarely explicit and devoid of ambiguity" (AI 146) and to have "always failed in his attempts at systematization" (AI 166).
60. I. Leclerc, *Whitehead's Metaphysics*, p. 24. The general Aristotelian principle is not exactly identical with the ontological principle, but generalizes it. See L. S. Ford, "Perfecting the Ontological Principle," in *Metaphysics as Foundation: Essays in Honor of Ivor Leclerc*, ed. P. A. Bogard & G. Treash, (Albany: State University of New York Press, 1993), p. 132. We may note that Aristotle characterizes the Platonic Forms as potentialities in the context dealing with the priority of actuality to potentiality (see note 59).

  63. For more detailed discussion about the One as the hyper-ontic activity, see my "The One's Knowledge," pp. 263-264, 311-315.
  64. See note 57.
  65. A good example is his exegesis of *Epistle II*, 312e (I 8 [51], 2, 28-32; V I [10], 8, 1-4; VI 7 [38], 42, 8-20). My own position is that the *locus classicus* for the priority of actuality is primarily *Republic* 509b, where the Good is said to be beyond being with

66. regard to power. See my "The One's Knowledge," pp. 314-315. For Plotinus' rejection of the Middle-Platonic doctrine, see also VI 7 [38], 8, 3-8. For more detailed discussion about this issue, see my "The One's Knowledge," pp. 124-126.
- The thesis to which Plotinus appeals for refusing the Middle-Platonic doctrine is the one that Plato employs for dismissing the suggestion that the Form may be a concept arising in human mind, the thesis that a concept is always of something that is (*Parmenides* 132b-c). Cornford's comment on this passage can be taken as an objection to the Middle-Platonic doctrine: "If it [sc. the Form] existed only in one mind, it would be inaccessible to all other" (*Plato and Parmenides*, p. 91). Notice that this thesis is exactly the same as the Cartesian version of the ontological principle, cited by Whitehead, that "every clear and distinct conception...cannot derive its origin from what is nought" (PR 40/64). In other words, the ontological principle in its Cartesian version rather checks the Middle-Platonic doctrine.
- In spite of Plato's refusal to regard Forms as concepts, the following remark by Patrides is acceptable: "Certainly the ever-present tendency to regard Plato's Forms as thoughts in the Divine Mind does not cancel the debt owed to Plato's original conception" ("The High and Aiery Hills of Platonism: An Introduction to the Cambridge Platonists," in *The Cambridge Platonists*, ed. C. A. Patrides [Cambridge: Cambridge University Press, 1969], p. 3).

  75. A. O. Lovejoy, *The Great Chain*, pp. 51-52.

76. W. A. Christian, *An Interpretation*, p. 200, n. 7. Strictly speaking, the notion of eternal objects as possibilities does not *per se* entail the rejection of the principle of plenitude. Lovejoy believes that the principle implies the conception of the world of Forms as "an order of 'possibilities'" (*The Great Chain*, p. 53). It is Whitehead's notion of God as "the principle of limitation" in SMW whereby he rejects the principle of plenitude (*op. cit.*, p. 333). For a more striking statement of his rejection of that principle, see AI 276: "There is no totality which is the harmony of all perfections."

In spite of his introduction of "the principle of limitation," contrary to Lovejoy's estimation, Whitehead's position in SMW is that all eternal objects are ingredient in all actual occasions: God is not yet considered to be the locus of unrealized possibilities so that eternal objects must depend on one or more of the actual occasions already in existence. See L. S. Ford, *The Emergence of Whitehead's Metaphysics 1925-1929* (Albany: State University of New York Press, 1984), pp. 72-76. In SMW hence the rejection of the principle of plenitude is not complete. Whitehead is there forced to make room for unrealized possibilities. Our position that the Divine Eros is endowed with the urge to the finite realization of Forms is rather akin to his later theory of the elimination of alternative possibilities by means of negative prehension (PR 23-24/35, 41/66).

80. See note 77.
81. Plotinus continues as follows: "...but if one means 'things in the cosmos,' including soul and the things in the soul, all the things are here below which are in the intelligible world" (13,17-19, tr. A. H. Armstrong, adapted by A. Sumi). The soul here in discussion is the soul rising up from the body (13, 12). In Lovejoy's words, the things in the soul would belong to "conceptual possibility" rather than to "physical actuality."

85. Syrianus, *In Met.* 147,1-6. It is noteworthy that a disciple of Plotinus so explicitly refuses the principle of plenitude.
86. R. T. Wallis, *Neoplatonism*, p. 94.
87. W. A. Christian, *An Interpretation*, p. 254. See also AI 276. The same thought is expressed otherwise in MT 52: "A partially understood pattern is more definite as to what it excludes than as to what its completion would include. As to inclusion there are an infinitude of alternative modes of completion."
88. W. R. Inge, *The Philosophy of Plotinus*, 2 vols. (London: Longmans, 1928), 1:189.
89. In PR all relationships among eternal objects are taken as dependent on the primordial valuations of God. In SMW, however, Whitehead considers each eternal object to have its status in the "general systematic complex of mutual relatedness" which "is inherent in the character of possibility," so that "the realm of eternal objects is properly described as a 'realm'" (SMW 161, Italics mine). As Rorty points out, the latter view implies that those objects might, all by themselves, exercise an influence upon the choices made about them, and would have to be counted as themselves actualities. Whitehead was incautious about this danger in SMW. See R. M. Rorty, "Matter and Event," in *Explorations in Whitehead's Philosophy*, ed. L. S. Ford and G. L. Kline (New York: Fordham University Press, 1983), p. 91. But Christian endeavors to show that Whitehead in SMW speaks of eternal objects as related in the primordial nature of God, and thereby that his doctrine in SMW is consistent with that in PR (*An Interpretation*, pp. 258-263). Here I do not go into problems which may be raised by Christian's construction.
90. See W. A. Christian, *An Interpretation*, p. 277.
91. On the contrary, Forms in their individual essences are only externally related (W. A. Christian, *An Interpretation*, p. 277). See also note 92.

For internal relatedness among Forms in Plotinus, see V 8 [31], 4 *passim*; V 9 [5], 10, 9-10. Bréhier regards Plotinus' theory of mutual inclusiveness of intelligible beings as the transformation of the Stoic doctrine of universal sympathy (*The Philosophy of Plotinus*, p. 94). Although I cannot subscribe to this view, it reminds us of internal relatedness among Forms.

The Platonic counterpart of the relational essence of eternal objects would be the Form's capacity ( $\delta\upsilon\nu\alpha\mu\iota\varsigma$ ) of combination

with other Forms (*Sophist* 251e, 252d).

92. A. H. Armstrong, "Eternity, Life and Movement in Plotinus' Accounts of ΝΟΥΣ," in *Le Néoplatonisme* (Paris: Centre de la Recherche Scientifique, 1971), pp. 67-74; *idem*, "Elements in the Thought of Plotinus at Variance with Classical Intellectualism," *The Journal of Hellenic Studies* 93 (1973): 19.

For the unchangeability of the individual essences of Forms not to be infringed upon by possible modifications in their relational essences, their relational essences must be only externally related to their own individual essences, while those individual essences are internally related to their own relational essences, as Whitehead notes in "the principle of the Isolation of Eternal Objects" (SMW 165). This external relatedness also solves the difficulty posed by the finite realization of specific Forms as mentioned in note 76. See L. S. Ford, *The Emergence*, pp. 76-80.

Rorty tries to defend the unchangeability of eternal objects in being reevaluated, by saying that the order among them "is not some sort of quasi-spatiotemporal reshuffling, but is simply the 'suggestions' about which eternal objects are more relevant than others made to a concrescent actual entity...by the Primordial Nature of God" (*Explorations*, pp. 102-103, n. 39). But this conception of the order cannot be a plausible solution to the present problem.

On the alternative that the order among eternal objects is intrinsically fixed, Rorty notes, the actuality would be forced to "follow rigid guidelines, tiresomely reiterating pre-established patterns" (*op. cit.*, p. 91). On the other hand, our proposal that the order is dependent on the Psyche's activity would dispel an anxiety that Divine Intellect might get bored with itself. Armstrong believes that this anxiety, of which "a great philosopher in the Platonic-Aristotelian tradition should ever have thought," must have crossed Plotinus' mind (*The Journal of Hellenic Studies* 93 (1973): 20). Because of the necessity to explain why Intellect does not get bored with itself, Plotinus found himself compelled, perhaps rather against his will, to talk about "eternal life" in V 8 [31], 4 (*ibid.*). The "eternal life" without any tedium is described as follows:

They do not grow weary of contemplation there, or so filled with it as to cease contemplating....But there is a lack of satisfaction there in the sense that fullness does not cause contempt for that which has produced it: for that which sees goes on seeing still more, and, perceiving an infinite self and those which are seen, follows its own nature (V 8 [31], 4,

27-34, tr. A. H. Armstrong, adapted by A. Sumi).

This description nicely fits our proposal. An infinite multiplicity of Forms—grasped would result in the infinite richness of the basic Psyche's experience of fullness, the content of which is continually and endlessly being modified in its patterns. But our view may be countered by the objection that the eternality of Forms, whether their order is fixed or not, does not allow God to experience any absolute novelty. See L. S. Ford, "Contrasting Conceptions of Creation," *Review of Metaphysics* 45 (1991): 100-102.

 94. I. Leclerc, *Whitehead's Metaphysics*, p. 86.  
 95. For the ontological status of the One as the unique activity, see note 63. In his informal presentation of the One's nature and activity, Plotinus speaks of the self-creation of the One (VI 8 [39], 13, 55; 15, 8-9).  
 96. G. M. Gurtler, *The Experience of Unity*, p. 81.  
 97. For my exegesis of this passage, see A. Sumi, "The One's Knowledge," p. 200. See also G. M. Gurtler, *The Experience of Unity*, p. 81: "The use of consciousness with the One clarifies the kind of unity implied by the other cases...."  
 98. See also V 6 [24], 5, 1-2; VI 7 [38], 16, 19-20; 35, 30-33.  
 99. G. M. Gurtler, *The Experience of Unity*, p. 80.  
 100. D. F. T. Rodier, *The Significance of Neoplatonism*, pp. 313-315.  
 101. It is true, as Rodier notes, that the image of any Form in matter has the unstability of matter. But the unstability does not confirm that matter is a dynamic principle responsible for the ongoingness of the universe. It is rather better compared to a dead body (II 4 [12], 5, 15-18; V 1 [10], 2, 25-27).  
 102. W. A. Christian, *An Interpretation*, pp. 277-279.  
 103. For the undiminished giving of the One's power, see V 5 [32], 10, 21-23; VI 9 [9], 5, 36-37; 9, 1-6.  
 104. IV 8 [6], 6, 10; V 2 [11], 2, 2; V 3 [49], 12, 33-34; V 4 [7], 2, 21; 2, 33-34. See also M. Baltes, *Die Weltentstehung des platonischen Timaios nach den antiken Interpreten*, 2 vols. (Leiden: E. J. Brill, 1976-1978), 1: 200.  
 105. I. Leclerc, *Whitehead's Metaphysics*, pp. 82-85.  
 106. In Whitehead's interpretation, the Psyche and the Eros are indissolubly tied with one another. It is from the operation of both of them that "the 'life and motion,' which are essentials in Plato's later thought, are derived" (AI 275).

There is an alternative that the One is analogized to such a Form as Order-in-general that corresponds to the Form of the

Good. But, if it were introduced, the multiplicity of Forms would no longer remain unstructured. Whitehead rejects the notion of one ideal order (PR 83-84/128). See R. M. Rorty, *Explorations*, pp. 91-92.

107. See W. J. Garland, "The Ultimacy of Creativity," in *Explorations in Whitehead's Philosophy*, ed. L. S. Ford and G. L. Kline, (New York: Fordham University Press, 1983), p. 212. For an affinity of Whitehead's philosophy of organism to the scheme of Spinoza's thought, see PR 7/10-11.
108. Whitehead rejects the Spinozistic view that the necessary order of possibility is exhaustively actualized in an order constituted by actualities (W. A. Christian, *An Interpretation*, pp. 278-279).  
Ford entertains an alternative that the Forms are created out of something absolutely indeterminate (*Review of Metaphysics* 45 (1991): 102).
109. The notion of *natura naturans* would be also applicable to the creative One. For the Plotinian One as the highest "nature," see J. N. Deck, *Nature, Contemplation, and the One*, p. 20.
110. I. Leclerc, "Being and Becoming in Whitehead's Philosophy," in *Explorations in Whitehead's Philosophy*, ed. L. S. Ford and G. L. Kline, (New York: Fordham University Press, 1983), pp. 57-59.
111. Garland considers Whitehead's dictum that "[it] lies in the nature of things that the many enter into complex unity" (PR 21/31) to imply that our attempts at explanation must end at what he calls "ultimate explanation," which appeals to the principle of creativity, but not to specific actual entities (*Explorations*, pp. 222-223).
112. Plato also entertains that the total isolation of the Forms results in their non-existence, from a different viewpoint (*Sophist* 251e-252a).

Questioning the ultimacy of Whitehead's category of the ultimate, Neville proposes the alternative conception of creativity, designated as "ontological creativity," that it creates both one and many and accounts for ontological unity of one and many, the condition for creativity in the category of the ultimate. See R. C. Neville, "Whitehead on the One and the Many," in *Explorations in Whitehead's Philosophy*, ed. L. S. Ford and G. L. Kline (New York: Fordham University Press, 1983), pp. 257-271. If the creative One were analogized to ontological creativity which is "productive of all determinate plurality" (*op. cit.*, p. 267), we could say that all Forms were derived from it. In the present undertaking, however, we wish to rest on Whitehead's primitive notion of creativity with Leclerc's interpretation and do not develop the notion of the creative One with recourse to Neville's

- alternative conception.
113. See J. Bussanich, "Plotinus on the Inner Life of the One," *Ancient Philosophy* 7 (1987): 178. See also my "The One's Knowledge," p. 321, n. 27 to Chapter VI of Part II.
114. I 7 [54], 1, 17-20; III 9 [13], 9, 8-10; V 3 [49], 12, 23-24; VI 7 [38], 40, 29-30. See also J. Bussanich, *The One and Its Relation to Intellect in Plotinus* (Leiden: E. J. Brill, 1988), p. 213.
115. Here I subscribe to Garland's view that creativity is the ultimate explanatory principle that lies beyond the scope of the ontological principle (*Explorations*, pp. 217-224). The status of the Plotinian One as the hyper-ontic activity presupposes the priority of ἐνέργεια to οὐσία, a bold challenge to the Aristotelian tradition of metaphysics ("The One's Knowledge," pp. 312-313). Whitehead characterizes the ontological principle as "the general Aristotelian principle" (PR 40/64). Leclerc explains this characterization by saying that the ontological principle constitutes the fundamental assertion about "existence" or "being" of a thing which is actual or οὐσία (*Whitehead's Metaphysics*, pp. 20-25). The thesis that the principle of creativity lies beyond the scope of the ontological principle marks its ultimacy over that Aristotelian principle, though it is not a challenge to it.
116. D. F. T. Rodier, *The Significance of Neoplatonism*, p. 315.
117. Since creativity is somehow a positive notion, our endeavor to develop the notion of the One in its analogy to creativity is forced to counterbalance the positivity derived from the notion of creativity and the transcendence which necessarily involves some negativity. In other words, we are reluctant to rely deeply on negative theology in unfolding the notion of the creative One. In this respect, our stance will be sharply contrasted with Armstrong's position that he expects a positive contribution of the negative theology of the One to natural theology in the intellectual climate of our own period. See A. H. Armstrong, "The Escape of the One: An Investigation of Some Possibilities of Apophatic Theology Imperfectly Realised in the West," *Studia Patristica* 13 (1975): 87-89; "Negative Theology, Myth and Incarnation," in *Neoplatonism and Christian Thought*, ed. D. O'Meara (Albany: State University of New York Press, 1982), pp. 213-222; "Platonic Mirrors," *Eranos* 55 (1988): 172-173; "On Not Knowing Too Much about God," *Philosophy*, supplement 25 (1989): 129-145. For my objection to his position, see A. Sumi, "The One's Knowledge," pp. 358-361.
118. My special thanks are due to Professor Lewis S. Ford for helpful suggestions and comments in producing the final version of this paper.

# Santayana's Christian Neo-Platonism

Paul G. Kuntz

## Part I

In the "Preface" to *Scepticism and Animal Faith* Santayana<sup>1</sup> writes that "The Realms of Being of which I speak are not parts of a cosmos, nor one great cosmos together; they are only kinds or categories of things which I find conspicuously different and worth distinguishing, at least in my own thoughts."<sup>1</sup> Does this mean that categories are as real as the cosmos or that we make the categorial distinctions in our thought? *Scepticism and Animal Faith* can be read in either an objectivist or a subjectivist way.

The significance of order in Santayana's philosophy had not fully developed by 1889, in *Lotze's System of Philosophy*, though there is a clear repudiation, following Lotze, of a single cosmic order as in Leibniz, a "best of all possible worlds."<sup>2</sup> The full significance comes with the process by which matter takes on form, the central problem of the production of art in *The Sense of Beauty* and *Reason in Art*.<sup>3</sup> Order is central also in Santayana's moral and political philosophy, and the preliminary chapter "Chaos and Order" shows this.<sup>4</sup> What is particularly helpful in understanding the relationship of the four categorical orders to each other is his manuscript "The Order of Genesis and the Order of Discovery." How does Santayana's thinking about the four "realms" relate essence to existence to truth and to spirit? The answer is made very clear in *Scepticism and Animal Faith* and this shows that the initial problem of order in *The Life of Reason*<sup>5</sup> was, to Santayana's

---

<sup>1</sup>Reprinted from an article "The Ascent of Spirit: Is Santayana's System a Naturalistic Neo-Platonic Hierarchy?" From *Overheard in Seville: Bulletin of the Santayana Society* 10 (Fall 1992): 22-31. Used by permission.

satisfaction, solved in *Realms of Being*.<sup>6</sup> I think badly of Dewey's rejection of the *Realms* to leave only *The Life of Reason* by which to remember Santayana's contribution to moral philosophy.<sup>7</sup>

To set the stage for Santayana on order and the categories we will restate his apprehension and appropriation of Royce and James, whose philosophies of order become typical of the "Dialecticians" and the "Naturalists" respectively. Santayana's critique remains the best approach to understanding their relationship.

Then we can begin to appreciate in Santayana the distinction between essence and existence, first pointed out to Santayana by Royce, after the publication of *Interpretations of Poetry and Religion*. How Santayana came to add to the realms, beyond *matter* and *essence*, those of *truth* and *spirit* is not so clear, but "Apologia Pro Mente Sua" places the realms in their "proper logical" order.

There is a journey of the mind, as St. Bonaventura called it *itinerarium mentis*, from *essence* to *matter*, then to *truth* and to *spirit*. The realms are stages of a metaphysical adventure or pilgrimage, even, in a related metaphor, called by Santayana a "hunt."

In these metaphors Santayana reveals himself to be very much a Catholic philosopher working with a Neo-Platonic hierarchical scheme of Jacob's Ladder. Not only are persons on various levels, as says the Vicar of Iffley in *The Last Puritan*, "hylic," "psychic," and "pneumatic,"<sup>8</sup> but to compress the four realms or stages into three, societies are pre-rational, rational, and post-rational. These correspond to matter, essence and truth, and spirit in the metaphysics.

If the four orders as our categories are only what each of us finds "worth distinguishing," are they made by us and imposed upon reality or do we find them there in experiencing reality? *Scepticism and Animal Faith*, which as *The Life of Reason* can be read in either way, needs to be considered as a dialogue. The earlier dialogue is between the Naturalist (Empiricist) and the Dialectician (Idealist), that is, between James and Royce, and this is not unrelated to the later dialogue between the Subjectivist and the Objectivist—except that Santayana has a new basis for the categories, *animal faith*. Some categories may be nominal or subjective, but other categories are objective or real.

My conclusion will be that, although the *Realms* are first presented in a sceptical way, the conclusion of *Realms of Being*

uses the Holy Trinity as a symbol of three "dimensions of reality." If the three realms are not "one great cosmos together" are they one great God together, no parts, for God has no parts, but three aspects together as a fourth? How can each be all, yet the all a fourth dimension?

If one needs to define the term "order" which was carefully defined by James in *Principles of Psychology*<sup>9</sup> and by Royce in his *Principles of Logic*,<sup>10</sup> it is to the opening chapter of *The Life of Reason* that one could turn.<sup>11</sup> Although Santayana offers us seven meanings, among them is no parallel to serial order, which had deeply impressed James the psychologist, and which Royce the logician had defined in a way parallel to Whitehead and Russell; that is, a relation that is "asymmetrical, transitive and connected."<sup>12</sup> Santayana does not choose to be a mathematical formalist. The common sense meanings may be listed as:

1. "Any arrangement whatsoever" (RCS 36).
2. "A specific arrangement favourable to a given form of life" (RCS 36).
3. A process of gradually shifting stages (RCS 36).
4. "Another and now static order called historic truth," absolute and important (RCS 37).
5. "The efficacious and physical" causes (RCS 38).
6. An order of settled categories by which one accounts for something by its origin (RCS 38-9).
7. "The real universal order" (RCS 39).

"Order" obviously then has a wide enough range of meanings to cover all the varieties of being. Thus a single term can be specified to designate the relative status of a creature with its specific interest (Df. 2) or the absolute status of the cosmos itself (Df. 7). Order could be specified as to essential symmetry or asymmetry, be a two-termed symmetry rather than the three-termed asymmetry and transitivity (Df. 1), and one could argue for Santayana's philosophic shrewdness in avoiding the over-mathematising so evident in Russell's philosophic use of order as the central category of philosophy generally.

As Santayana demonstrated in his defiant imitation of analysis, "Some Meanings of the Word 'Is'," he could have begun his study of the categories with the definitions of "order."<sup>13</sup> Since our metaphysician chose rather to tell the story of the emergence of his "system," why should we not follow his narration?

Santayana always reminds us that he is a Catholic, and came as a stranger to live among Protestants. Since he considers philosophy to be religion naturalized, and he stresses above all his resentment of the Puritan arrogance of his teachers, we need to ask how exactly this helps to shape the contrast between the categories of a Catholic in contrast to those of a Protestant.

How does the very Protestant Bertrand Russell order his world and define the cosmos? In Santayana's excellent "Philosophy of Mr. Bertrand Russell," we find the Puritan moral habit of attaching his mind "to some essence or other."<sup>14</sup> Russell takes comfort in mathematics, thus "lay[ing] up his treasures in the mathematical heaven" (PBR 123). Russell in escape from the "dreary exile of the actual world" expresses his spirit. How, we may interrupt, does this differ from Santayana's radical distinction between essence and existence? The Puritan is far more dualistic, with less reconciliation of the sacramental Catholic.<sup>15</sup> The Puritan is confronting the realm of essences rather more morally than aesthetically. The Puritan essences are those "that ought to exist, or at least, if anything exists, it ought to conform to them. What exists, however, is deaf to this moral emphasis in the eternal; nature exists for no reason; and, indeed, why should she have subordinated her own arbitrariness to a good that is no less arbitrary? This good, however, is somehow good notwithstanding, so that there is an abysmal wrong in its not being obeyed. The world is, in principle, totally depraved; but as the good is not a power, there is no one to redeem the world" (PBR 153).

What is implicit in this well-distanced critique? That the modern categorial division is a deeper chasm than that of the Catholic world which has not only the redeemer—God who has become man by taking on human flesh in the realm of matter—but a Christology founded on the classical polarity of composite substance, matter and form.

The Protestant spirit, if it ceases to fear "hell in the next world," is still, in the heroic loneliness and rigidity of life, "sure to find it here." The Catholic Santayana, by contrast, retains bonds between levels of being and can use, as in myth and symbol, the material to express the spiritual. For Santayana to welcome religion as poetry, and use its rhetoric, is therefore deeply and metaphysically shocking to James and Royce.

Before Santayana, the young poet and critic, had recognized his own categories, Royce perceived what was implicit in *Interpretations of Poetry and Religion*.<sup>16</sup> For "the moral imagination" there are welcome fictions, not believed true to fact, and Santayana's former dissertation director Royce, "who had kept a kindly but troubled watch over [his] youth, once said that the gist of [his] philosophy was the separation of essence from existence. This was one of those rare criticisms that open one's eyes to one's own nature, ...perhaps one of those prophecies that help to fulfil themselves; because it came long before [he] began to make any special use of the word "essence," or to analyse the concept of existence."<sup>17</sup> Of course Royce's Protestant belief in America as the fulfilment of the divine order in history was quite different from Russell's estrangement of the "free man" from irredeemable existence. Royce's Puritanism did not drop God as cosmic imperative for the human spirit. How does Santayana regard Royce's "God"?<sup>18</sup> When Calvinism is logicized, God becomes universal mind: "what" writes Santayana, "I should call the truth, but personified and turned into a psychological entity." Can the category truth mediate between essence and existence? Even though "the contrast between essence and existence...is inevitable and axiomatic," and there is a different sense of "is" used for each, Royce attempts logically to get from one to the other. But this is fallacious in the logic of Santayana's categories. Logic operates only hypothetically and not existentially, or as he put it "not necessarily applicable to natural facts." Still, Royce wanted *connection* and control of the realm of essence over the realm of matter. Santayana here finds what the Puritan atheist Russell shares with the optimistic theistic rationalist Royce. Moral fervor controls metaphysics, which we may call "metaphysical moralism," or the imposition of the partial prejudices of a mere creaturely part upon the whole cosmos.

Santayana's philosophy of order and the categories is to be as unprejudiced as Spinoza's. Royce is a hypocrite in rebuking Santayana's categorial separation of essence and existence. The real motive is that Royce needed to give "logic...coercive authority over facts." Otherwise "his religious and political convictions could not be enforced by pure logic, but would have to be advanced on empirical evidence (notoriously not available) or else posited with sporting risks by a desperate act of faith" (APMS 498).

Royce's metaphysics is then the expression of moral faith that the good would triumph, by which he meant that he is fighting on the winning side. Santayana is drawn to Spinoza as an opponent of moralism: Santayana would accomplish for Catholic Christianity what Spinoza had done for Judaism. The efficacious and non-superstitious connection between essence and existence is artistic creation. This connection is encouraged by Catholic culture whereas it was discouraged by Puritan Protestantism.

Out of this fascinating debate of Santayana the Catholic with his Protestant teachers James and Royce and his Protestant friend Russell comes a philosophy of four orders: essence, existence, truth and spirit. Santayana has a way of reading these realms as stages of a pilgrimage. The selections in Fisch's *Classic American Philosophers* make these stages easier to follow (Essence, CAP 270-80, Matter, 287-91, Truth, 291-93, Spirit, 293-97).

These distinctions in discourse and experience can be affirmed, claims Santayana, at a time when "human faith is again in a state of dissolution." Empirical doubt, as in the case of Locke, dissolved knowledge of substance, and if the master category of Aristotle is gone what can the attributes qualify? The importance of Santayana's categories of the four orders is that even if "substance" is indefinable, and in an empirical sense we have no impression of it; it is indeed "something I know not what," still it is the object of animal faith.

The Catholic philosopher may have lost his religious faith but he has regained a philosophic faith. Scepticism can reduce the symbols of the creed to fiction, but scepticism cannot touch animal faith. "This natural faith opens to me various Realms of Being, having very different kinds of reality, and a different status in respect to my knowledge of them..." (CAP 297).

"Realms" symbolizes by geographical metaphor, and specifically on our metaphysical journey we have crossed "the watershed of criticism". We may be completely sceptical, yet the basis of faith affirms the Realms of Being. "I have now reached the culminating point of my survey of evidence, and the entanglements I have left behind me and the habitable regions I am looking for lie spread out before me like opposite valleys" (CAP 280; SAF 99). What realm was discovered in the valley of scepticism? Although life may there be but a dream, yet still there are essences. But in the vital valley of belief, in which we must act, we can do so by

faith, because we have no comparable certainty. What of the other three realms—of matter, truth, spirit? To journey thence is characterized as an *adventure*, a *hunt*, and an *ascent*. There is a sequence of journey metaphors that together constitute an allegory of increasing intensity and confident discovery. When we pass beyond the watershed there is a new rhetoric.

"It is AS IF Substance SAID to Knowledge: My child there is a great world for THEE to conquer, but it is vast, an ancient, and a recalcitrant world. It yields wonderful treasures to courage, when courage is guided by art and respects the limits set to it by nature. I should not have been so cruel as to give thee birth, if there had been nothing for thee to master; but having first prepared the field, I set in thy heart the LOVE OF ADVENTURE" (SAF 191, capitalization mine).

The metaphor of HUNTING from *The Realm of Matter*: "In the chase, for those who follow it, the intensity of experience is not like the intensity (limitless, if you will) of contemplating pure Being—immutable, equable, and complete. The hunter and the hunted believe in something ambushed and immanent: present images are little to them but signs for coming events. Things are getting thick, agents are coming together, or disappearing, they are killing and dying. The assurance of this sort of being is assurance of existence...."<sup>19</sup>

The metaphor of ASCENT is used in "On Metaphysical Projection," which Daniel Cory calls a "kind of supplementary Introduction to *Realms of Being*."<sup>20</sup> "The ontological hierarchy" runs from the bottom, MATTER through appearance, or "ESSENCES manifested to sense and to thought" to "the aspects which the universe would wear to omniscience," TRUTH, all unmanifested Being, THE REALM OF ESSENCE finally "the simplicity of PURE BEING."

"As these last phrases suggest, the interest of this ontology is not merely logical, in that it defines the order of a possible world, as we might frame the rules for a new game. It represents faithfully the stages of an actual spiritual progress: I will not say the only path of progress open to the human soul, because life is elastic; but certainly the path hitherto most familiar and sacred. Life carries every sensitive animal as far up as appearance; intelligence raises him, at least in intention, to the level of truth; contemplation lifts him to that of essence, and ecstasy into the heart of pure Being. But

this ascent is internal to experience...It is not a material translation from one part of the universe to another..." (OMP 119-20: I would insert "faith" between "life" and "intelligence", and say "animal faith comes to reveal in action the dynamic world called matter.")

This is a Platonic argument of correspondence between levels of soul and levels of being. Either a pure empiricism or a pure materialism is limited to the apprehension of either the realm of essence or the realm of matter. What is demanded psychologically of a person to comprehend both essence and matter is pure introspection into what is given and apprehension of the indefinable substance confronted in action by animal faith. In addition there must be developed the intelligence to grasp truths independent of either of the above, but dependent for existence on them, and also contemplation and ecstasy of the mystic who grasps Being and even Non-Being.

Has the argument above made too much use of the metaphors of journey, adventure, hunt, ascent? I believe not, because if the realms are distinguished because they are not reducible to one, then we must borrow terms from one of the realms and apply them to the transitions between realms. "Journey" is spatial, and borrowed from the realm of matter. But "ascent to the one," as in Plotinus, stresses not the travel but the goal beyond being.

Santayana was obviously a great geographical traveler, but was he not also a pilgrim? The most pertinent evidence is his neglected "The Philosophy of Travel,"<sup>21</sup> which I must confess has influenced my writing about homo viator.<sup>22</sup> Santayana's Catholic ordering of the cosmos begins with plants which are not as active as the animals in moving from place to place. Animals "owe their intelligence to their feet. No wonder, then, that a peripatetic philosophy should be the best..." We might put the contrast in terms of the watershed: we may sit and dream in the valley in which essences are discovered, but if we walk in the valley in which we discover existing matter and truth, we must think. "*Thinking while you walk ...keeps you alert: your thoughts, though following some single path through the labyrinth, review real things in their real order; you are keen for discovery, ready for novelties, laughing at every little surprise, even if it is a mishap; you are careful to choose the right road, and if you take the wrong one, you are anxious and able to correct your error...*" As novel objects appear, "a thousand hypotheses run to meet them..." (PT 9).

The old word before "hierarchia" was invented in a philosophical sense by the Pseudo-Dionysius, was "gradus," as in St. Augustine. Santayana graded kinds of travelers: better than *migrants* and *immigrants* are *explorers*; better than *conquerors* are the disinterested *adventurer* and *scientific observer*; better than the *merchant* is the *tourist*. But the kind Santayana is, is a *spectator*. He alone has *SAVING knowledge*. "A man who knows the world cannot covet the world; and if he were not content with his lot in it (which after all has included that saving knowledge) he would be showing little respect for all those alien perfections which he professes to admire" (PT 16).<sup>23</sup>

Although we cannot do more than suggest the Platonic hierarchial correspondence between levels of soul and levels of being, we need also to suggest that in some very precise ways Santayana's theory of virtues is likewise hierarchical. Plotinus and other Neo-Platonists, holding to the doctrine of four cardinal virtues, distinguish the level of development, and we have grades of temperance, courage, justice and wisdom.<sup>24</sup>

One example must suffice, but it is the well-developed contrast between degrees and kinds of courage.

Blind courage is an animal virtue indispensable in a world full of dangers and evils where a certain insensibility and dash are requisite to skirt the precipice without vertigo. Such animal courage seems therefore beautiful rather than desperate or cruel, and being the lowest and most instinctive of virtues it is the one most widely and sincerely admired. In the form of steadiness under risks rationally taken, and perseverance so long as there is a chance of success, courage is a true virtue; but it ceases to be one when the love of danger, a useful passion when danger is unavoidable, begins to lead men into evils which it was unnecessary to face. Bravado, provocativeness, and a gambler's instinct, with a love of hitting hard..., is a temper which ought already to be counted among the vices rather than the virtues of man. To delight in war is a merit in the soldier, a dangerous quality in the captain, and a positive crime in the statesman.<sup>25</sup>

My argument about the relationship between *The Life of Reason* and *Realms of Being* is that both use the principle of hierarchy to integrate various philosophies. Each kind of morality is appropriate to its level. Each kind of ontology is appropriate to its level. Just as the Neo-Platonist could agree with Aristotle's categories and with Plato's categories, just as the Hindu Vedantist could agree

with all the orthodox systems, just as Hegel attempted an integration of the whole history of thought, so Santayana's system of the four orders makes whole what are otherwise disparate and incompatible parts of wisdom.

My departure from the well-established interpretations of Santayana's system is that these overemphasize the naturalism, that is, the realm of matter.<sup>26</sup> The other way to put the same point, these established interpretations have not taken seriously the appeal to "the Indians" as representatives of universal human wisdom. I have in another place tried to spell out why it is so important to note the initial mottoes of *The Realm of Spirit*, quotations from Plotinus, from *The Upanishads*, from Spinoza<sup>27</sup> "Spirit can never condemn or undermine natural life; this can be done only by some rival centre of life at the same biological level, tending to steal away matter or energy from its ancestors or neighbours." "Spirit requires no new matter or energy besides that of its organ, but only order and harmony in the matter or energy at hand" (RS 552).

My emphasis on order is of course my personal central concern but it is a not inappropriate way to recognize what the different realms share such that they can not only be distinguished but also integrated. *The Realm of Matter* began with the scripture so frequently quoted by the Western Medieval scholastics and the Renaissance founders of modern science, such as Pascal, "Thou hast ordered all things in number and measure and weight."<sup>28</sup>

If the physical order were the only real order, then the order of essences, the order of truths, and the "order and harmony" sought by the spirit would be partial and eccentric, and as such subjective. But the search for objectivity of the categories as discovered in being rather than imposed upon it, culminates in spirit. Spirit, says Santayana, has no commitment but "to see things as they are" (RS 553, emphasis mine).

Santayana's philosophy forces us to rethink "objectivity" such that there is not merely objectivity on the level of matter, but also on the levels of essence, truth, and spirit. The clue is given to unravel this mystery. The

presence of essences occasionally to imagination was very accurately called by the Scholastics their *objective* being, contrasted with the intrinsic or logical being which they had in themselves, and with the formal embodiment which they might have in things; but in the utter

confusion of modern philosophy, substances being denied in one breath and imagination in the next, 'the objective' has come to mean that which is independent of intent or attention fixed upon it; which is precisely what the *objective* can never be. It is indeed the intuition of essences in their own category, when the things that may embody them are absent or non-existent, that makes up the essence of spirit.... Spirit is the actuality of the unsubstantial.<sup>29</sup>

As "being" has many senses, so also "objectivity", and "category," and "order." The vision provided by spirit in its reflection on the levels of being is systematically pluralistic. Santayana is what I have called an "order pluralist." The finest expression of this position is in the "Conclusion" to *Dominations and Powers*.<sup>30</sup>

Rational government limits what it imposes by law as required and leaves all else "to the special genius of each free society and each free individual." In suggesting such a division of moral labour, order where the conditions are known, liberty where imagination makes its own laws, Santayana is not expressing confidence that we can achieve such balance and maintain it. "Reason is itself a method of imaginative thought. It insinuates itself with difficulty even into economic arts, by virtue of the regularity of natural processes, to which action has to adapt itself; but it lives happy and safe only in ideal constructions, mathematical or poetical" (DP 463).

What is the difference between Santayana's synthesis of the many orders and a metaphilosophy of different types of philosophies? Both Santayana and such metaphilosophies as those of S.C. Pepper's *World Hypotheses* and Richard McKeon's four methods share tolerance of alternative metaphors and methods. It is the hierarchical ordering of the different orders as stages on a philosophic pilgrimage that is special to Santayana. Hierarchy is alien to Pepper<sup>31</sup> and McKeon, who make a democratic virtue of equality, while hierarchy is Santayana's chief super order, and he does not conceal his aristocratic principle of inequality.<sup>32</sup>

Santayana's hierarchical ordering is not as rigid as some traditional systems that identify the highest as that which is both the origin of the process of becoming and the first principle discovered by rational reflection. Such a deductive system makes all that is an attribute of God or Nature, and also the first axiomatic truth that it

is that which is cause of itself. Santayana's thinking about stages distinguishes "The Order of Genesis and the Order of Discovery."<sup>33</sup>

First: In the order of genesis comes essence since it spreads out the field of forms through which existence may travel and may pick up one form after another along its special path. Existence in this order is second and truth third: for truth is the ideally complete description of the existing world, as it is, has been, and is to be. Finally spirit with all its discoveries comes last because the psyche—without which spirit could not arise or life—is a trope established in matter; that is to say, a truth concerning the order and cohesion of certain events in the flux of nature (OGOD 2).<sup>34</sup>

As far as the origin of the world from ultimate one, this theory is non-committal. But clearly the Neo-Platonic emanation from intelligence, to psyche, finally to matter, is denied. There is no cosmic way down toward matter as "almost nothing," as St. Augustine called matter. In this sense, the Neo-Platonic hierarchy, as Hegel's world by Marx, has been stood on its head. And a card-carrying Plotinian would certainly disapprove of Santayana's ontological Umwertung as much as an orthodox Christian must disavow Nietzsche.

Yet there is also "the order of discovery." In this order "what comes first is matter. Undoubtedly a pure and free spirit, could such a spirit exist, would distinguish essence at the first dawn of consciousness and would never distinguish anything else ['any datum of intuition...is *ipso facto* a pure essence']...; the very nature and function of spirit is to distill pure essence, simple or complex, from the flux of existence. Yet in an animal life intuition is hatched in a nest of pressing occasions: intent precedes intuition...." I believe the account of spirit deeply troubled by demands of the flesh, especially the demands of passions that fill "spirit with a sense of urgency, of distress, or of triumph" is the kind of struggle depicted by St. Augustine in his *Confessions*. Why is Platonism a necessary step in turning to God? Because spirit, in Santayana's account, "may come to rest for a moment on the pure forms of things and on their essential relations..." (OGOD 3).

If this is a Neo-Platonic "way up," as I am asserting it is, it is a struggling way up through the realm of matter towards something more satisfying to spirit in the flesh. It corresponds to St. Augustine's version, and if the fragment had not broken off, it

could have given the way back to the Father through Truth, the Son. Santayana, as Augustine, follows John's Gospel in identifying "Christ with the Logos" and avoids "the semblance of reduplicating the Godhead."<sup>35</sup> The Logos is not only "the Light, the Way, the Truth" but also "Life and Love" that seem to fit better with the mediating office of Christ, as teacher and redeemer and the intimate essence of his person (ICG 32). Does Santayana identify will and love as the way to freedom? Yes, when that will is directed to what spirit truly loves (ICG 193 quotes Augustine, "Quid magis in voluntate quam ipsa voluntas?").

The metaphysical importance of Christ is that this is a symbol of mediation. The realms that are otherwise separate are united when the Word becomes flesh. There is more to Santayana's use of the symbol of Christ than "spirituality."<sup>36</sup>

The Incarnation leads to that other great mystery of faith, the Holy Trinity. In the "General Review" Santayana uses the Father as symbol of "the realm of matter" and the Son as "the realm of essence." Although these are distinguished in the cosmos, in the Godhead they are one. This dogma "which might seem unintelligible, becomes clear if we consider that power could not possibly produce anything unless it borrowed some form from the realm of essence and imposed that form on itself and on its works." Power is not power unless it produces "something specific, something eternally distinct and recognizable in its character. The Son is thus an indispensable partner and vehicle for the life of the Father" (RS 846).

The Logos is "*begotten not made*" (RB 846). The Logos is "as much God as the Father, since power cannot exist without form. But form also cannot exist without substance..." (RB 847).

To these "incommensurable and equally original features of existence [I had rather say 'being']" are added the third dimension, Spirit (RS 847-8). On this the Nicene Creed is relatively silent except that the Spirit "proceeds from the Father and the Son and is the universal lord and life-giver," and is equally divine (RS 849). Insofar as the Spirit speaks by the prophets, is this also the Realm of Truth? This is suggested because spirit is known "by all voices inspired by power and by truth" (RS 850). In this sense, there is, for metaphysical purposes, a Holy Quaternity in the Holy Trinity.

Has this conclusion erred in pressing too far the parallelism between the Christian dogma and the language of ontology based

on analysis? Santayana warns against it (RS 853). I wish to avoid the question here of the senses in which Santayana is a Christian philosopher.<sup>37</sup> He is certainly a Christian poet, at least sometimes.<sup>38</sup> One important point with which to end is that the Realms of Being which are distinguished in our world are united in God. That Santayana had to end by borrowing from theology the symbol of three in one to express a truth that the four realms require one another signifies that his system was left unfinished, a project yet to be completed. And should not every metaphysician, as did Whitehead, say his system is incomplete? As an invitation to reflect it remains one of the great suggestive frameworks which we can use in our present "metaphysical turn" of philosophy.

## Part II

Spirit, since its essence is to aspire,  
comes to life at the foot of the ladder;  
it lives by contemplation,  
by knowing the thing above it.<sup>39</sup>

My reading of Santayana puts the spirit at the center, and organizes the other aspects of the metaphysical system, including naturalism, around this center. This is a reading that is different, I am told, from others.<sup>40</sup> Santayana, when he reflected on his long literary productivity found this meaning:

In my various books I have discussed things at very unequal removes from the fountain of spirit within me. But that center was truly philosophical. I can identify my self heartily with nothing in me except with the flame of spirit itself. Therefore the truest picture of my inmost being would show none of the features of my person, and nothing of the background of my life. It would show only the light of understanding that burned within me and, as far as it could, consumed and purified all the rest.<sup>41</sup>

This passage from *the Idler and his Works* presents a crucial problem for American naturalism. Is Santayana only a "half-hearted realist and less than a half-hearted American" who celebrated the spirit in man as the flame of the divine? Is he to be

pitted as so old with senses failing and even regarded for these words "pathetically false to his naturalistic realist friends"?<sup>42</sup>

Even before we analyze some of the many sources we need to state clearly what the problem is in having a position called "naturalistic Neo-Platonic hierarchy." Although I had already given up the way down from the One, emanation, but claimed that Santayana could be a Neo-Platonist if he preserved a way up, the ascent of spirit, Saatkamp states a difficulty I had ignored. How can there be hierarchy without teleology, a cosmic purpose fulfilled in the ascent of spirits? The metaphysical dilemma is this, if there is fulfilment of such a end, then indeed Santayana may be a Christian Neo-Platonist, but if not, then he has so far diverged from Neo-Platonism that honesty demands that we not confound the issue by any discourse of man on a pilgrimage.

If I have introduced confusion by not following the conventional classification of Santayana as a naturalist who is only a naturalist, then I should allow Saatkamp the last word. But we must understand Santayana the Catholic, who, standing "at the church door," hoped that a philosopher, saint, or poet—Plotinus, Augustine, or Dante—would give him the key to enter that portal. But if that hope proved vain, there remains only the poetry of *homo viator* as a projection, or work of the moral imagination, imposed on a neutral and valueless and chance existence. Naturalism dispels the illusions of religion, and in the cold air of truth there should be no nostalgia for the warmth of the cozy and incensed interior of the church.

The naturalistic critique of the Neo-Platonic metaphors, which Santayana admittedly uses, nevertheless, according to Saatkamp admits an "integral relationship" between the "realisms of being and spiritual values" (III, 22). But since these values are all presumably "genuine interests" of the body and the psyche, they can be only "projections from a material base." Bodies and circumstances are of many and diverse sorts, hence there are "diverse forms of good, each complete and not convergent with other goods..." (III, 23). It would then follow, as Saatkamp says, that the hierarchical claim that the spiritual life exemplifies virtues that are "higher than" the animal life has no basis. The single value specified as "spiritual" is that of freedom as the "goal of highest value," and there is no order, as of essences, for the spirit to aspire toward and to be united to (III, 24–25). Therefore, although the

"steps of spiritual progress" is a well-trod path held in many traditional philosophies of East and West to be sacred, these have only a certain "poetic beauty" (HI, 26). What Dante presents therefore could not give to pilgrims "a hierarchical map" with directions toward "an ultimate goal." Saatkamp gives a beautifully logical and coherent picture. He is true to the central statement which he quotes from Santayana: "So much for the projection of an ontological hierarchy, marking stages of spiritual emancipation, into a metaphysical world beyond the natural world, or taking its place. The fable is transparent."<sup>43</sup>

Yet if this critique from a naturalistic perspective is true, why does Santayana not reduce essence, truth, and spirit to chapters of *The Realm of Matter*? Why are they given full treatment as realms which are called "real" and called "realms of being"? Why does Santayana spend so much time on the journey beyond the level of matter and exploring the categories of these other orders? Why does he call attention to the wisdom of idealistic and transcendentalist Hindus and Buddhists, praising their guidance as superior even to the Neo-Platonic Greeks? Why should Santayana himself trace the "steps of spiritual progress," indicating the virtues attained by saints? There is more than mere traveling through the varieties of religious experience, as though Santayana were a psychological companion of William James and an historical colleague of Josiah Royce. Saatkamp leaves us with Santayana the "festive critic" who interprets but does not judge the rank of a sheer plurality of forms (HI, 27).

How is it that in the *Three Philosophical Poets*, although Santayana the critic accepts the cosmology of Lucretius, he accepts the moral order of Dante, and ranks him the highest poet? How is it that in *The Life of Reason* Santayana condemns the Jews and Protestants who are limited to prerational attachments to the natural world and are not disillusioned and detached as the Indians of the post-rational stage of development? When his attention was called to Dean Inge's restatement of the wisdom of Plotinus, Santayana wrote *Platonism and the Spiritual Life*. And, when rereading the *New Testament* as though *The Idea of Christ in the Gospels*.

Therefore I reread one of the above, *Platonism and the Spiritual Life*, and it convinced me that Santayana's naturalism can be read in a Neo-Platonic way, and this is more justified than the opposite

reading of the spiritual life and its ascent in a naturalistic perspective.

Wherein does my reading of Santayana's Jacob's Ladder differ from Saatkamp's?

1. The naturalist rendering of hierarchy as a mere projection is not true to the realistic justification of the harmony and hierarchy that Plato discerns in the Cosmos (I & II, 1-8).

2. The naturalistic rejection of "pre-existing celestial models" for life frees us from committing the intellectual error of invoking "magnetic control over formless matter, inducing in it here and there an inward striving to imitate their form" (9-10). But it is not true to the realistic tendency of Platonists and Christians to fail to recognize the "natural underpinning which values require if they were to arise" (10). "Some constitution the cosmos must have, and must disclose to our faith of science" (11) (III).

3. The critique rejects Ideas as powers and as separate from exemplification (12) but not "the sense—a somewhat esoteric sense—in which such essences as beauty may be called 'the most real things in the universe'" (13).

The good may be called absolute (14). Only if we have some "absolutes" is there something higher for spirit to aspire to be united with.

4. The critique is true to the rejection of independent Ideas or Forms on the basis of artistic creation. The beauty lies in the poem that has a certain "precise arrangement of words and images." Those are natural causes of the thing which manifests that beauty (12). Although this naturalistic explanation ruins the possibility that forms emanate the formed, nevertheless there is according to Santayana a good case that God and the ideas are and must be independent. Otherwise they cannot be worshiped (16). Indeed Dean Inge's Platonism is too modern and subjectivistic in abandoning supernatural dualism.

Santayana knows the advantages of naturalistic reduction of vision to projection, but also he sees deficiency and resultant inadequacy.

Platonism... would be entirely stultified and eviscerated if it were not suffered to be all that modern criticism, inspired as it is by a subjective psychological philosophy, most thoroughly dislikes; I mean supernaturalistic, realistic, and dualistic. This is only another way of saying that God and the unseen world really exist in themselves, so that they can precede, create, attract, and survive their earthly emanations. (V, 17-18)

5. Naturalism faithfully uses the method of dissolving dogmas "into their subjective components, and showing them to be but verbal expressions for certain radical ambient values." Platonism can be naturalistically demonstrated to be "but a moral and poetic fable" (20). But this is Platonism "taken literally and dogmatically...[as seen by] the outsider" (19). Those who reject Platonism "have not understood it from within, historically, emotionally; they have not recovered the experience and the immanent logic..." (19-20). Only when emanation is so understood do we understand that hierarchy or steps or levels are "rounds of a Jacob's ladder by which the soul might climb again to her native heaven, and it was only *'there'*, above, that she truly lived and had been blessed from all eternity" (25). When the spirit burns with "concentrated fire" there are hierarchies of angelic choirs above, and below are mere "incidents in the barnyard" (25). "The only ambition worthy of a philosopher was to transcend and transfigure his human nature, and to pass unsullied through the nether world in adoration of the world above" (25-26).

6. Moral life is a life of attachment and duties, and to this naturalistic ethics attends. Here there are and must be degrees: the "moral parable" of "the realm of ethics will always be a set of concentric circles. Life necessarily radiates from centres": self, family, nation, world...(27). Yet when love is liberated from pious attachments, then intellectual life of the spirit, discounting the lower hierarchy, relegates animal needs and prejudices "to their relative station, where by their nature they belong" (29).

Santayana here is rethinking the political life in contrast to the spiritual life. As Plotinus says, there is order common to both, a lower hierarchy and a higher hierarchy. The analogy is implicit but most effectively conveyed by examples.

7. There is an illusion that the natural world is made for man, and specifically is a "protecting world designed for...benefit or vindication" of our specific political way of life...(31). Santayana denounces moralism, and sometimes it is only naturalism that is proposed as freeing us from illusions of a "coddling...universe" (31). "Spirituality" says Santayana "comes precisely of surrendering this animal arrogance and this moral fanaticism...." The spirit attains "perfect candour and impartial vision."

At this point Santayana goes beyond even the Alexandrine Greeks to the Indians, Moslems, Christians, and Jews, in giving an account of universal mercy. "Spirit is merciful...because it has no private motive to make it spiteful; yet it is unflinchingly austere because it cannot make any private motive its own" (31). At this point there is not only implicitly Guatama Buddha's universal sympathy but also Jesus Christ. "The spirit is content with the widow's mite and a cup of cold water; it considers the lilies of the field; it can say with literal truth: Inasmuch as ye did it unto the least of these, ye did it unto me." Here the theme developed twenty years later: the Christ represents spirit (32).

Is there then, apart from the variety of pieties, each tied to a part of the human race, as well as relative to time and circumstance, also a universal orthodoxy? Earlier Santayana had appealed to Platonism as part of perennial philosophy. From the naturalistic perspective, the very idea of a transcending universal morality, appealing to an 'unchangeable order' is absurd. Does spirit then transcend moral relativism?

8. Another paradox emerges in IX: although as spirit ascends, all below its level appears contemptible, and mystics are famous for regarding matter as filth (cf. 25), with universal charity comes the Franciscan spirit: "As it loves the non-human parts of nature, so it loves the human parts, and is in no way hostile to the natural passions and to the political and religious institutions that happen to prevail" (32). Earlier spirituality was contrasted to political institutions and to institutions of piety. But there is a stage at which spirituality accepts piety.

9. Another paradox is that earlier spirit is disintoxicated (Santayana stressed disintoxication, 30) and renounces the world, but spirit can accept "any level of being" as good (33). Then is

there nothing evil? Evil is only "accidental," as "slackness in the strings" that do not play the universal harmony (33). The harmony can be restored. The vision of universal good in musical or other artistic metaphors can be found in Leibniz and Berkeley, and is here called "orthodox morality." This is close to saying that evil is only privative, nothing real, or as Augustine says, "nothing."

"Imperfection enters [the world] only below the circle of the moon, like bad manners below stairs; and even here, on earth, evil is but an oscillation and dizziness in matter which nature perpetually calls back to the norm, as the motion of a top rights it in its gyrations" (34).

Not only then is everything good in its way, but also there is a principle which we call "homeostatic" which corrects excess.

10. The naturalistic critique of such a Platonic doctrine of cosmic harmony and balance is that it is belied by contingent existence. As we follow Santayana dialectically, the transcendentalist voice having become so eloquent calls for the naturalistic voice in him. "...existence, while it is the home of particular certitudes, is also a cage in which an inevitable and infinite ignorance sings and dies imprisoned" (35). Santayana goes on about the self-centeredness of existences, their limited character and duration, much as Bertrand Russell refers to a "higgledy-piggledy job lot of a world in which chance has flung us." Is there nothing essentially orderly or unlimited or eternal...? What is there to aspire to and how can spirit ascend? Not so, replies the spirit. There is the realm of essence, which is alone "necessary" and "all-comprehensive being." This is not merely another possible world, to which spirit might flee seeking freedom, but "infinite Being" (36).

11. A naturalistic objection to spirituality is that there are few contemplatives and very few saints. To exist depends on "material conditions," and spiritual people are no exceptions. By what condition does a man become a "spiritual man"? Any such theory must provide an explanation of how some became "spiritual." "...Concentration of thought, indifference to fortune and reputation, warmth of temperament (because spirit cannot burn clear except at a high temperature) disciplined into chastity and renunciation" (38). Santayana speaks of "novices," and has in mind, as in St. Johannes Climacus and St. John Cassian, the specific virtues that must be

attained as climbing the rungs of Jacob's Ladder. Santayana knows the encouragement of zeal, the examination of conscience, the striving for holiness by serving God alone (39). There is also patience implicit, specifically waiting for gifts of the spirit.

As we considered virtues earlier (6, 7), so here is an amplification of courage and confidence of those who become spiritual. "The spirit itself is not afraid of being stamped out here, or anxious to be kindled there; its concern is not about its instances or manifestations; it is not essentially learned or social; its kingdom is not of this world. It leaves propaganda to those who call themselves its friends but probably know nothing of it, or are even its enemies, and only agents of some worldly transformation ultimately quite nugatory" (39-40).

The whole of XI is on the antithesis between the world and the spirit, and ends with the world judging its spiritual people by what they contribute of value to the world, as business judges what artists create. The spirituals reciprocally evaluate what the world contributes from the perspective of spirit. Whereas politics is partial, "Spirituality is the supreme good for those who are called to it, the few whose intellectual thirst can be quenched only by impartial truth and the self-annihilating contemplation of all Being" (40).

The section begins: "it is the world's business to call down spirit to dwell in it, not the spirit's business to make a world in which to dwell" (38). The ambiguities involved are such that it might make more sense to say that "it is NOT the world's business to call down spirit to dwell in it."

12. A very obvious common sense naturalism opens XII: "It is impossible that spirit in a living creature should ever be wholly freed from the body and from the world..." The liberation of spirit from body cannot be a total detachment, otherwise the flame of spirit evaporates without the fuel of the lamp. Ontologically the talk of independence of spirit is therefore absurd. Santayana goes further and points out that if contemplation of "essences and truth" could lead spirit to union with "Pure Being," this particular mind ceases to be a special perspective, and omniscience has nothing which could be added to it.

How are we to think of the categories in which, for example, the Fourth Gospel contrasts the "spirit" to the "flesh"? Santayana's

hermeneutics is that the distinction is not between kinds of substance but "*the quality of their attention*" (italics mine, 42). One is "intuitive possession." The other, flesh, means "an anxiety, inquiry, desire and fear." Can we make a choice between the naturalistic and the spiritual perspectives, having quickly switched from the dependence on the body and the environment to the troubles of the body in an environment? The position of Santayana is that both are true. The naturalistic truth is that "spirit must have some organ." The spiritual truth is that when spirit is "once aroused it does not look in the direction of its organ or care at all about preserving it. It looks rather...to a realm anterior to all worlds,...infinite Being..." (43).

We had been told that the spiritual man has an "intellectual thirst [which] can be quenched only by impartial truth" (40). It follows that spirit does not invent another world. "The spirit," writes Santayana, "is not a tale-bearer having a mock world of its own to substitute for the humble circumstances of this life" (42). Here the spiritual Santayana replies to the charge of some naturalists that spirituality is wishful thinking and self-deception.

But the spirit, telling the truth about the world, becomes the object of "worldly hatred, and it is very fierce...." At this point we have proceeded section by section through XII, roughly half of *Platonism and the Spiritual Life*, and it is time to pause and to reflect that, in spite of the naturalistic critique, there still remains for spirit a ladder of ascent.

Plato and his followers have projected their moral ascent onto the cosmos and ignored the naturalistic fact that only bodies have power and forms are not causes. Second, Plato is still political, attached to the *polis*, and reads the cosmos as a crystal setting for the Greek city state, with the failure to free spirituality from piety. With these deep reservations about Plato himself, what is there to be said for Platonism? The spirit knows the body as the body does not know the spirit. The body ties us to particular circumstance, but the spirit frees us for universal vision. The body leads to frustration because needs cannot be satisfied endlessly, and in disillusion the spirit contemplates essences and truths which do satisfy the desire to know. The body cannot set limits or find endless satisfaction, but the spirit discovers infinite Being and eternal essences and truths. The body is a source of values found in

the environment and in other bodies, but the spirit loves all things and finds all things to a degree good.

The very recognition of the variety of goods through naturalism, its tolerance, makes it a phase of spirituality. It was wrong then to oppose naturalism to Platonic spirituality, as though it were a zero-sum game and the advantage of one were the loss of the other. The whole effort to state naturalism as basis for discounting Santayana's Neo-Platonism is a mistake. Santayana developed the two together, not one external to the other as exclusive alternatives. The whole style of Santayana in every section of *Platonism and the Spiritual Life* is a dialogue between Santayana the naturalistic critic and Santayana the defender of Plato and proponent of the spiritual life. There are not two Santayanases but one.

Without going into the same detail and without extensive quotation, the second half of the book elaborates the ways in which there can be and should be a "naturalistic Neo-Platonic hierarchy." It is going beyond the evidence of the text of *Platonism and the Spiritual Life* to say that the author is commending rather than merely describing.

On what basis can the two parallel movements of thought converge?

Spirituality among Calvinists reduced the fanatical belief in divine punishment. When Santayana judges that "the speculative sword" both exalts the superhuman above "the weak judgements of the heart" and should dissolve "moral fanaticism," is he perhaps referring to such New England Transcendentalists as Emerson, on whom Santayana in his early career had written eloquently? His statement is also in harmony with Spinoza's *Ethics*: "Pure Being is infinite, its essence includes all essences; how then should it issue particular commands, or be an acrimonious moralist?" (XIII, 45). The One of Plotinus, though "called good, is not properly so called" (46). Just as the relative forms of the good diminish prejudice when naturalistic analysis discloses the partiality of any life form, so the mystic transcendence of good itself as a category brings "the peace that passeth understanding..." (46).

A familiar distinction of aspects of religion is between piety and spirituality. Historically, as we know from *Reason in Religion*, piety is conceived in Hebraic terms as faithfulness to the Lord of the people to whom he has given his law, while spirituality is the

Hellenic universalizing of salvation. Here the "profound dualism" is between "creative power and redeeming grace" which "point in opposite directions; but a complete religion needs to look both ways, feeding piously at the breast of nature, yet weaning itself spiritually from that necessary comfort to the contemplation of...eternal things" (XIV, 48).

Our attention has been called to Santayana's devotion to Hermes. Santayana thought mythically, as should one in the Neo-Platonic tradition. Attachment to home and the detachment of travel can be reconciled. "The psyche in each of us is like Vesta, the goddess of the Ilcarth, mother of the Promethean flame, mother of spirit; and she needs to learn the difficult unselfishness of the parent—or of the foster-parent; for her child is of another race. She must be content to be abandoned, revisited only in haste or on some idle holiday, with a retrospective piety; and even as she embraces her full-grown over-topping son he will seem a stranger to her, and she will catch sight of his eyes, gazing over her head into a far country" (XV, 52).

Although doctrines conflict, questions of diverse perspectives converge. Santayana's naturalism and spirituality may sometimes be contrasted and contradictory views of causal efficacy and material causes without purpose are not tenable as a doctrine with universal providential design. But Santayana also expresses naturalistic questions about "moralistic metaphysics" and "spirit" also means to question "human vanity" (XVI, 55). "When I say the *light of the spirit*, I might as well say light simply; for what is spirit but the act of making light actual, or greeting, observing, questioning, and judging anything and everything. Spirit is awareness, intelligence, recollection. It requires no dogmas, as does animal faith or the art of living" (XVI, 56).

"Order" is a categorical requirement of naturalism and also of spirituality, and in many modes of order this is elaborated. "Chaos could not sustain the animal life, the psyche, which spirit requires for its organ" (XVI, 56). Natural forces "have established rhythms, such as day and night, favourable to that life..." (58). And between spirit and its conditions there can develop "natural harmony" (58).

An important mode of order is balance, holding the middle way and avoiding excess. Wisdom is required of both piety and spirituality. The folly of Platonic and Christian piety is to worship power and to go beyond experience in positing other sources of life

(XVII, 60). The folly of spirituality is to deny its dependence. These are bad forms of spirituality: "The pride of Lucifer, the mock independence of the Stoic sage, the acosmism and absoluteness of the Indian mystic, and the egotism of German philosophy, thinking to create and recreate its world in its flight through nothingness" (XVII, 60). There must be a marriage of piety with spirituality and no forced attitude that leads to any attempt to divorce them.

Santayana goes on to specify conditions of balance, harmony, reconciling the opposites: spirituality is not doctrinaire as scientific thought with a primary concern for the truth of a system (XVII, 61). And spirit accepts graciously whatever conditions support it, and towards institutions expresses "a resigned courtesy. Such things must needs be; it would be foolish to reject them instead of profiting by them" (XVII, 63).

Another danger of the spirit in forgetting its dependence is to so free itself from the finite that it loses itself in the formless infinite or the infinity of forms. The moral point of view is then to prevent any "idle aestheticism" (XVIII, 66). To be human is to live under specific conditions. "Perfect impartiality is not human..." (68). "It is therefore natural that the intrinsic infinity of Being should remain in the background, even in the spiritual life, and that essences should be contemplated and distinguished rather as ideals for the human imagination than as beings necessary in themselves" (XVIII, 68).

Only towards the end of *Platonism and the Spiritual Life* is the question raised: what is meant by emanation? "Consider the universe of Plotinus: a process of emanation from the One through the Ideas to the Soul of the World, whence, like rays from different stars, human and animal souls descend on occasion to animate material bodies." What is the purpose of this hierarchical cosmology? "This system was designed to encourage the spirit to rise from its animal prison...reversing that emanation until it covered the primal bliss of contemplative union with pure Being" (XIX, 70). But nothing in the system itself "invite[s] the spirit to ascend at all." Therefore we might as well have Hegelian evolution of stages without any "wish...to reverse the process in his heart..." An Hegelian would wish to press on in the process, and would see "angels...descending Jacob's Ladder, and none ascending." Santayana's system is to reverse Hegel and to state the purpose of

Plotinus. The central proposition is, "only the ascent concerns the spiritual life" (XIX, 71). Emanation is by itself only to account for what has happened prior to spirit awakening, "entangled in animal passions and foolish ambitions." Santayana then does not totally diverge from the moral judgement that our spirits are imprisoned (71).<sup>44</sup>

Starting from whatever facts and predicaments may seem to envelop it, [spirit's] function is to detach itself from them one by one, escaping the flux and urgency which they have in the REALM OF EXISTENCE, unraveling and synthesizing their temporal perspectives, in order to transpose them all into the REALM OF TRUTH, where they form an eternal picture; and then to let this picture itself recede into its setting in the REALM OF ESSENCE, where it is but one form of being, which this world by chance has manifested, amid the countless forms of being which perhaps have not been manifested anywhere. (XIX, 71, capitalizations added.)

Here are the four realms of Being related as stages of ascent. Could we not then say that Santayana's system is a Neo-Platonic system, with acknowledged ancestry in Plotinus? Is this not another introduction to *The Realms of Being* that states, as did *Scepticism and Animal Faith*, that spirit is going toward salvation. Emanation is a "projection" with a soteriological intent, and the cosmology that is closer to fact, as naturalists judge fact, can be accepted as a substitute, just as *Three Philosophical Poets* holds to the moral degrees of virtues from the *Divine Comedy* as well as to the atomistic mechanism of Lucretius.

We have then a 'naturalistic Neo-Platonic hierarchy'! This is indeed at first paradoxical and contradictory, but not at the end of a long series of interpretative qualifications. But can such a 'naturalistic Neo-Platonic hierarchy' be 'Christian'? We saw above that Santayana uses the symbols of the angels ascending and descending. He is in the tradition of the Pseudo-Dionysus. Ponder the passage remembering the sermon of the Vicar of Iffley in *The Last Puritan*: "The angels, even in their descent, will then be messengers to the philosopher from an eternal world, to which in ascending again, they carry up his heart..." (XIX, 72).

Another Christian aspect of Neo-Platonism is speculation on the persons of the Holy Trinity, similar to that in the "General Review" of *Realms of Being* (XX, 73-74). In my original essay, I coupled

the Trinity with the doctrine of the Incarnation. The point of "speculative fiction" is to express the concept of descent as well as of ascent (74).

The concluding chapters show a qualified sympathy with mysticism. The qualification of accounts of the bliss of union is that "the reports which reach us of the ecstasy indicate that the chasm has never really been bridged" with supreme Being (XIX, 76). But the best communication of the saint is silence and only by repeating his experience can we know. "The saint pulls up his ladder with him into his private heaven..." (XXI, 76). This is of philosophic importance because the language of metaphysics uses metaphorical language. We might speak of a "heaven of forms" as well as a "realm of essence." We have no geographical spatiality relating "all sorts of regions which are not of this world" (XXI, 78).

Similarly, both religious mystics and speculative metaphysicians talk of Nothing as well as of Being (XXII, 80-82). The saints, including those devoted to the Buddhist Nirvana and Hindu Brahma, show the need of the "spiritual life" for a language of symbols. Santayana's cool naturalism comes out in XXII: "they use, like all of us, the words they find" (XXII, 81).

Santayana frequently quotes from the Gospels, and grasps one further point that recommends spirituality; it is a rebuke to the righteous. Spirit "crop[s] out marvelously in the sinner, as it may in the child or the poet" (XXIII, 84). Santayana prefers the Gospels to Plato:

Platonism is moralistic.... It was a censorious, puritan, prescriptive love; it was not spontaneous, it was not sympathetic, it was not love of nature at all, but a political, human good. ...Free spirit would be more generous.... The spirit, having itself suffered, recognizes in many an alien form of existence a maimed effort and a lost glory analogous to its own; but a love unqualified by prejudice, by envy, by fear of being outshone or discountenanced. ...It is the essence of spirit to see and love things for their own sake.... (XXV, 92-93)

## NOTES

1. *Scepticism and Animal Faith* (New York: Scribners, 1923), p.v. For convenience I shall abbreviate this Preface to *The Realms of Being* "SAF" and sometimes quote from the selections in Max H. Fisch, *Classic American Philosophers* (New York: Appleton-Century-Crofts, 1951), p. 268 (abbreviated in text "CAP") Unless otherwise noted, books and manuscripts mentioned are by Santayana.
2. Although Lotze speaks, in Santayana's words, "of the unity of the cosmic process and of the purpose of nature,...this unity will never constitute for him the value and justification of what comes under it; rather it will be the condition and means of producing conscious and happy life." Paul G. Kuntz, Ed., *Lotze's System of Philosophy* (Bloomington: Indiana University press, 1971), p. 138. Santayana ascribes this idealistic optimism to a way of thought in Kant and Hegel called "formalism," which Santayana defines as "a system that tends to reduce things to the relations between them." *Ibid.*
3. I believe we need to study the progression from *The Sense of Beauty* to *Reason in Art* as mediation between matter and form, and therefore of prime metaphysical importance.
4. "Chaos and Order," Ms., early draft for *Dominations and Powers*, 5 p., gift of Corliss Lamont, Columbia University. The chapter "Chaos and Order" occurs as Book First, Chapter I of *Dominations and Powers*. See Beth Judith Singer, "Order and Liberty in Human Life: A Study of Santayana's Metaphysics of Society," Ph.D., Columbia University, 1967.
5. *The Life of Reason* begins "Whether Chaos or Order lay at the beginning of things," a question debated between Dialecticians who appeal to a "principle" prior to creation while Naturalists trace creatures springing from chaos. *Reason in Common Sense* (New York: Scribner's, 1922), p. 35. (This first volume will be abbreviated in the text as "RCS")
6. *Realms of Being*, one-volume edition with a new Introduction (New York: Scribner's, 1942). (Abbreviated "RB")
7. "Dewey's Naturalistic Metaphysics" has recently been republished in an Appendix to John Dewey, *The Later Works, 1925-1953*, Vol. 3: 1927-1928. Eds: Jo Ann Boydston and Patricia Baysinger. Introduction by David Sidorsky (Carbondale: Southern Illinois University Press, 1984), pp. 367-84. This volume contains "Half-Hearted Naturalism," pp. 73-81, and "Philosophy as a Fine Art. Review of George Santayana's *The Real of Essence*," pp. 287-93. I owe these valuable references to my colleague, Professor James S. Gouinlock.
8. See my "The Tragedy of Oliver Olden: Santayana's Last Puritan: A Phenomenological Study of Order and Chaos," *Memorias del XIII Congreso Internacional de Filosofia*, Vol. 8, pp. 331-45, México: Universidad Nacional Autonomía de México, 1964.
9. There is an unexplained gap between the consideration of order in *Principles of Psychology* and *Varieties of Religious Experience*. In the first, *Principles of Psychology* (New York: Henry Holt, 1890), Vol. I, p. 490, and Vol. II, p. 646, the principle of skipping intermediary terms is "on the whole the broadest and deepest law of man's thought." In the second, such a principle is replaced by any subjective response to any arrangement whatsoever, depending on the satisfaction of interest. See the Modern Library Edition, 1936, of *Varieties*, ft. Pp. 428-30.
10. Josiah Royce "Order", James Hastings, *Encyclopaedia of Religion and Ethics*, (Edinburgh: T. And T. Clark, 1917), Vol. IX, pp. 553-40, and *Royce's Logical Essays*, Ed. Daniel S. Robinson (Dubuque, Iowa: Wm. C. Brown, 1951), pp. 204-31.
11. My "Santayana's Theory of Order," part of my *American Philosophies of Order*, is based on a study of the five-volume *Life of Reason*.
12. My *Alfred North Whitehead* (Boston: Twayne's, 1984) and *Bertrand Russell* (Boston: Twayne's, 1986) show the centrality of order to their philosophies.
13. "Some Meanings of the Word 'Is'," in Justus Buchler and Benjamin Schwartz, Eds., *Obiter Scripta* (New York: Charles Scribner's Sons, 1936), pp. 189-212, with commentary *Apologia*, *op. cit.*, p. 576.
14. "The Philosophy of Mr. Bertrand Russell," *Winds of Doctrine: Studies in Contemporary Opinion* (New York: Scribner's, 1913). (Abbreviated "PBR")
15. See Archibald Allen Bowman, "Physical and Spiritual in Modern Philosophy," in *A Sacramental Universe: A Study in the Metaphysics of Experience* (Princeton: Princeton University Press, 1939), pp. 51-84, and my "Religion in the Life and Thought of George Santayana," Ph.D., Harvard University, 1946.
16. *Interpretations of Poetry and Religion* (New York: Scribner's, 1900 and 1922).
17. See page 497 of "Apologia Pro Mente Sua," *The Philosophy of George Santayana*, ed. Paul Arthur Schilpp (Evanston: Northwestern University Press, 1940), pp. 495-605. (Abbreviated "APMS").
18. See Chapter IV of *Character and Opinion in the United States: With Reminiscences of William James and Josiah Royce and Academic Life* (New York: Scribner's, 1920).
19. *The Realm of Matter* (New York: Scribner's, 1930), pp. 9-11. CAP 289-290 then recounts ten principles of the cosmos of substance.

20. *The Idler and His Works and Other Essays*, Ed. Daniel Cory (New York: George Braziller, 1957), p. vi, "On Metaphysical Projection," pp. 116-35. Cory gives no date for this piece which begins by referring to orthodox Hindu speculations on Brahma, and uses a subtitle: "by which Existence is referred to the Non-Existent as to its Ground." (abbreviated "OMP").
21. "The Philosophy of Travel," *The Birth of Reason and Other Essays*, Ed. Daniel Cory (New York: Columbia University Press, 1968), pp. 5-17. (abbreviated "PT")
- My contributions to philosophy of travel appear in *Itinerarium: The Idea of Journey*, Ed. Leonard J. Bowman (Salzburg: Institut für Anglistik Amerikanistik, Universität Salzburg, 1983), especially "Man The Wayfarer", pp. 216-34. "Augustine: From Homo Erro to Homo Viator," appears also in *Augustinian Studies*, Vol. 11, 1980, pp. 79-89.
22. My "From the Angel to the Worm: The Hierarchical Structure of St. Augustine's *Confessions*," forthcoming in *Religious Studies*. Many articles such as this on hierarchy are gathered together in *The Great Chain of Being After Fifty Years*, Eds. Marion Leathers and Paul Grimley Kuntz (Bern: Peter Lang, forthcoming).
23. Cf. *My Host the World, Persons and Places*, Vol. III (New York: Scribner's, 1953), Ch. III, pp. 33-56, and "The Coming Philosophy," in *The Idler and His Works (Doc. Cit.)* p. 192. Note how interested Santayana is in the metaphor of E.B. Holt, *The Concept of Consciousness*: A navigator exploring his course at night with the help of a searchlight illuminates a considerable expanse of wave and cloud and other objects that lie above the horizon. The cross sections are neither inside of the searchlight nor dependent on the searchlight for their "SUBSTANCE OR THEIR BEING", (p. 171, emphasis mine).
24. My contribution to Brian Vickers' collected volume *Action and Contemplation* considers the grades of virtues (forthcoming).
25. *The Life of Reason, or the Phases of Human Progress: Reason in Society* (New York: Scribner's, 1932), pp. 83-4. The passage is followed by a passage written from the perspective of the post-rational level. In the Augustinian judgment, the virtues of the pre-rational, even the rational, are but "splendid vices" (*Ibid.*, p. 84).
26. I have attempted three demonstrations of non-naturalism in Santayana: "Santayana the Mystic," "Santayana and Buddhism," and "Santayana and the Indians." A brief account is "The Thread of Salvation in this Labyrinth of Folly," in *Philosophy in the Life of a Nation*, (N.Y. CUNY, 1976, pp. 140-44).
27. In conjunction with *Platonism and the Spiritual Life* (New York: Scribner's, 1927). I am informed by R. Baine Harris that he has made study of the correspondence between Dean Inge and Santayana. This is important in showing his relation to the leading Christian Platonist and Plotinus scholar of our century. *The Realm of Spirit* in RB., p. 548

- (hereafter abbreviated "RS").
28. RM 182, from *Wisdom of Solomon*.
29. *Realm of Essence* in RB 129.
30. *Dominations and Powers: Reflections on Liberty and Government*, (New York: Scribner's, 1951); (abbreviated "DP"). I enjoyed the excellent commentary of Beth J. Singer, *The Rational Society: A Critical Study of Santayana's Social Thought* (Cleveland: The Press of Western Reserve University, 1970).
31. Stephen C. Pepper, *World Hypotheses* (Berkeley: University of California Press, 1942).
32. "Equality," MS, Columbia University Library.
33. "The Order of Genesis and the Order of Discovery" MS, Columbia University Library (hereafter abbreviated "OGOD").
34. Timothy L.S. Sprigge, *Santayana: An Examination of His Philosophy* (London: Routledge and Kegan Paul, 1974) is particularly helpful on "reality" of "a system of behavioural dispositions" paralleling a "system of tropes." (p. 103)
35. *The Idea of Christ in the Gospels or God in Man* (New York: Scribner's, 1946), p. 31 (hereafter abbreviated "ICG").
36. Sprigge's interpretation here seems to me only a partial truth. *Op. Cit.*, p. 216.
37. My article "Can Whitehead be Made a Christian Philosopher?" *Process Studies*, Vol. 12, No. 4, Winter 1982, pp. 232-42, shows the complexity of the problem.
- I have tried to show the importance of Christ as mediator and the doctrine of the Incarnation in "The Dualism of Paul Elmer More," *Religious Studies*, Vol. 16, 1980, pp. 389-44, especially the conclusion.
38. *The Oxford Book of Christian Verse*, Ed. Lord David Cecil (Oxford: The Clarendon Press, 1940) has recently led to a new edition with a subtle consideration of what could be meant by "Christian poet." Perhaps the best title for an essay on Santayana would be "The Christian Philosophy and Christian Poetry of an Ex-Christian." Relevant to this is the analysis of T.S. Eliot that not even Russell succeeded in becoming truly "ex-Christian". See my *Bertrand Russell*, *op. cit.*, Ch. 8. Lord David writes in his Introduction of Blake: "It is doubtful whether he should appear in a book of Christian verse at all. If he was a Christian, he was certainly a heretic." The gospel of Santayana is equally surprising and also at odds "with the doctrines of every important branch of Christianity...." Then comes the defense: "But Blake, whether he would or no, was soaked through with Christian thought: Christian symbols are an essential part of his native language." This I find true of Santayana, and with regard to life as a journey, I should add that he was "exquisitely responsive to certain phases of Christian sentiment" (p. xxvi). The editor writing in 1940

includes seven poems of Blake beginning with "To Mercy, Pity, Peace, and Love". The successor to Lord David, Donald Davie, in *The New Oxford Book of Christian Verse* (Oxford: Oxford University Press, 1981) limits Blake to "Jerusalem." I suspect that Santayana, whose sonnet on faith was once used by religious liberals, is now less acceptable than he used to be. Davie includes a long note on the Neo-Orthodox Karl Barth, who would have classed Santayana as a Gnostic and very non-Christian.

39. George Santayana, *Platonism and the Spiritual Life*, Charles Scribner's Sons, New York, 1927, p. 73. Page references of the form (19-20) or (V, 19-20), without further identification, are to this book. A version of this paper was presented at the American Philosophical Association, Sheraton-Boston, 29 December 1986, in a series on Neo-Platonism and American Philosophers.

## Plotinus and Wittgenstein on Memory

Joseph Sen

### I

A "family resemblance" between Plotinus and Wittgenstein has been detected on more than one occasion. Emilsson, commenting on Dillon, has seen this in terms of a highly personal method and style common to both philosophers and exemplified most clearly in their tendency to write as though thinking aloud.<sup>1</sup> Hadot, on the other hand, concentrating on the early Wittgenstein has drawn attention to the significance of the mystical in the *Tractatus* and construed this as a modern expression of the perennial concern of the *Enneads*.<sup>2</sup> These similarities, while somewhat provisional, do indicate a potentially fruitful connection. We must nevertheless be careful lest any comparison becomes vacuous through its very generality. A family resemblance, we might say, is more impressive if we have more to go on than the most general features of the thinking involved—a deeper kinship might perhaps emerge from an investigation of points of detail, the moles and spots, as it were, not only the broader profile. In this paper I will engage in such genealogy through limiting myself to the subject of memory as it appears in the discussions of Plotinus and Wittgenstein. Plotinus, as we shall see, develops a view of memory which is remarkably in line with a rather exceptional one maintained by Wittgenstein's in recent times. This does not necessarily enforce the plausibility of Plotinus' view but it certainly lends it pertinence for contemporary discussion.<sup>3</sup>

## II

I will forget temporal priority and begin with a remark from Wittgenstein:

I saw this man years ago: now I have seen him again, I recognize him, I remember his name. And why does there have to be a cause of this remembering in my nervous system? Why must something or other, whatever it may be, be stored up there in any form? Why must a trace have been left behind? Why should there not be a psychological regularity to which no physiological regularity corresponds? If this upsets our concepts of causality then it is high time they were upset.<sup>4</sup>

Wittgenstein is here calling into question identity-theories of memory which posit a physical trace of some sort to account for the "preservation" of memory across time. Usually, this trace is thought to be deposited in the brain of the rememberer, to be reactivated on the occasion of recall. It is somehow felt necessary to postulate such a physical intermediary to fill in the gap between the original experience and the event of recall. What we have here is a three-tier theory of memory: firstly, an experience occurs; secondly, it is stored away as a physical trace; thirdly, it is recalled. The second stage is here thought especially crucial for explaining remembering so far as it prevents a temporal gap between the original experience and the act of recall. Otherwise, we might be faced with a form of causality across temporal gaps which is, of course, a highly disreputable notion in this context!<sup>5</sup> Wittgenstein contests the conceptual inevitability of this second stage. Ockham's razor might serve us well here were it not for a reluctance on our part to discard a physical entity, even when its being is purely theoretical. Wittgenstein, however, asks boldly

Why should there not be a natural law connecting a starting and a finishing state of a system, but not covering the intermediary state?<sup>6</sup>

Wittgenstein is not so much formulating a positive thesis here as presenting a possibility which tends to get overlooked, so set are we on assuming that something must function as a trace to account for the causality of memory. Why not simply consider that there is no particular physical counterpart to the act of remembering? Why,

in short, do we feel so compelled to fill the gap by postulating some physical intermediary?

## III

Plotinus provides one answer to this question. When it comes to the soul we tend to base our thinking upon inappropriate analogies drawn from our experience of physical things.<sup>7</sup> We think of perception and memory, for example, in terms of letters written on tablets or pages. Plotinus could have Plato's discussion of the wax tablet in the *Theaetetus* in mind here but Aristotle, who pursues the analogy more vigorously, is the likelier target. In his treatise *On Memory and Recollection* Aristotle identifies memory with an image (*phantasma*) in the soul, which is an imprint (*tupos*) in the body of a former sense-perception.<sup>8</sup> The memory-image is an affection which Aristotle likens to a picture—

For the change that occurs marks in a sort of imprint, as it were, of the sense-image, as people do who seal things with signet rings.<sup>9</sup>

Plotinus is critical of this picture of memory. He insists that the activity involved is nothing like what happens in the case of wax.<sup>10</sup>

The wax tablet analogy obscures the fact that memories are not magnitudes nor are they comparable to seal-impressions, counter-pressures or imprints.<sup>11</sup> Since memories are not physical no physicalist account associating them with a process of "pushing" from the outside will explain them. To take this back a step: given that even sense perceptions don't involve physical imprints, how could memories be retentions of imprints which were never inscribed in the soul in the first place?<sup>12</sup> Plotinus rejects the physicalist analogy and prefers to construe memory (as well as sense-perception) on the analogy of thinking (*noësis*).<sup>13</sup> If, for example, it makes little sense to speak of thoughts as counterpressures the same holds true for memory. Or again if in thinking nothing is stored away in the soul like a shape in wax, the same holds true for memory.<sup>14</sup>

Plotinus examines the coherence of the tablet analogy in further detail. It encourages us to think of the mind as a tablet marked by imprints which enable us to gain access to previous experiences.

After all, its advocate might say, how could we remember something that wasn't already stored away "in" the mind? This picture, however, comes apart on inspection. It is subject to a two-pronged dilemma<sup>15</sup>:

...if the impressions persist, either it will not be possible for others to be imprinted because the first will prevent them, so that there will be no other sense-impressions, or if others are made, those former impressions will be destroyed: so that there will be no possibility of remembering.<sup>16</sup>

The weakness of the wax analogy is here exposed in the light of our effective ability to remember and perceive things in succession without one experience impeding the other. Conversely, "smudging" would seem inevitable if memories really were akin to physical shapes or images and the soul a wax tablet.<sup>17</sup>

If there is a particular analogy Plotinus favours for understanding memory it is the more active one of physical exercise (*gymnasia*).<sup>18</sup> On the tablet analogy better memory would be related to susceptibility to greater numbers of impressions. We might, then, expect memory to improve in proportion to degree of affection. Practically, however, memory seldom works like this—

exercises to improve our mental grasp show that what is going on is an empowering of the soul, just like physical training of our arms and legs to make them do easily what does not lie in the arms or legs, but what they are made ready for by continuous exercise.<sup>19</sup>

How, Plotinus asks, would it be possible to forget something and remember later if all memory involved was the presence of impressions? The tablet analogy would have us think that memory is simply a straightforward matter of something being physically in the mind or not. By contrast, the comparison with exercise suggests that things are never so clear-cut. Memory, for example, can be improved and strengthened through practice. This shows that memory depends on something more than mere passivity to impressions and affections—

what actually occurs appears to be the opposite of this; for nowhere does exercise for any purpose make what is exercised easily affected;

since with the senses also it is not what is weak, an eye for instance, which sees, but the organ which has greater power for its activity.<sup>20</sup>

The static view of the mind which the tablet analogy suggests is here replaced by something much more dynamic and, for that matter, organic. The mind here is less akin to a slate than a muscle which can be built up through exercise, not because of enlarged storage space. The accent thus shifts from regarding memory simply in terms of contents deposited in the mind to a more subjective emphasis upon the soul's power to initiate and strengthen the ability to recall.

#### IV

Wittgenstein provides an assessment of the impression-based model of memory which we have considered so far:

An event leaves a trace in the memory: one sometimes imagines this as if it consisted in the event's having left a trace, an impression, a consequence, in the nervous system. As if one could say: even the nerves have a memory. But then when someone remembered an event, he would have to infer it from this impression, this trace. Whatever the event does leave behind in the organism, it isn't the memory.<sup>21</sup>

Wittgenstein does not deny outright the possibility of some kind of physical correlate to memory but is doubtful whether this is constitutive of memory as such. If it were, it would mean that remembering would be a much more indirect and awkward procedure than we usually experience it to be. On this view, remembering would require first looking up a trace already present and stored in the brain and then inferring the memory from it. Generally, Wittgenstein is skeptical about such attempts to explain memory in terms of intermediary factors, whether physical or mental. These accounts lose sight of the direct, non-inferential character of the larger part of mnemonic experience. For example, the tendency to view memory as a sort of picture of the past can be misleading:

Experiences of the past are not like objects in the next room; although I do not see them now, I can go there. But can I go into the past?<sup>22</sup>

This indicates a limitation in the spatial notion of a picture as a means of illuminating the essentially successive character of temporal experience. While a physical picture can be placed alongside an original for comparison a memory image can hardly be set alongside an independently given past. More often than not we simply have to trust our memories; doubt is exceptional, certainly not the rule. For this reason Wittgenstein speaks of the way in which memory is the "source"<sup>23</sup> of our consciousness of the past, not merely a sign of it.<sup>24</sup>

Plotinus emphasizes this more active and indeed creative<sup>25</sup> character by describing memory as a power (*dunamis*)<sup>26</sup> and a strength (*iskhus*).<sup>27</sup> Specifically, memory is the power or ability to "have what we do not have".<sup>28</sup> This cryptic phrase alludes to the fact that what we remember can be present "to" us without, however, being present "in" us like a shape in wax or, for that matter, like a physical trace in the nervous system. Plotinus admits that it is indeed "wonderous" that the soul should have such an ability, that it should, in other words, be capable of having apprehensions without affections.<sup>29</sup> It is nevertheless an ability which needs to be appreciated on its own terms and not explained away.<sup>30</sup> The latter happens when memory is reduced to the far less paradoxical physical state where we can, after all, only have what we have. What is gained here in on the level of physical possession leaves us much worse off in terms of wonder. For those who regard wonder as a rather trifling commodity in philosophy this is no real loss but this is an assessment neither Plotinus nor Wittgenstein would share.<sup>31</sup>

## V

Plotinus and Wittgenstein are sensitive to the strong influence certain pictures can exert over our philosophizing. In the case of memory the picture with which they contend portrays the mind as a passive tablet or storehouse in which experience inscribes its indentations.<sup>32</sup> Now we need, of course, to be sensitive to the contexts in which these arguments occur. Part of the motivation for Plotinus is to maintain the impassibility of the soul which is hardly a concern to Wittgenstein. Nevertheless, we can perhaps detect a certain kinship in these critiques. Some pictures have a very long

shelf-life in philosophy; but they can also provide a way of tracing otherwise inconspicuous ties between seemingly disparate thinkers.

## NOTES

1. See John Dillon's "The Mind of Plotinus" with commentary by E.K. Emilsson in *Proceedings of the Boston Area Colloquium in Ancient Philosophy* vol. 3, ed. John J. Cleary, (University Press of America, 1987), p. 359.
2. See *Plotinus on the Simplicity of Vision*, trans. Michael Chase (University of Chicago Press, 1993), p. 112.
3. The biologist Rupert Sheldrake has acknowledged Plotinus as the first Western philosopher to offer a critique of trace-centred theories of memory. Sheldrake has followed Plotinus' lead in his own work, see especially *The Presence of the Past* (Fontana, 1989), chpt. 12.
4. Zettel, #610, ed. and trans. G.E.M. Anscombe and G.H. von Wright (Basil Blackwell: Oxford, 1967).
5. Zettel, #613. Plotinus, of course, might be as comfortable with the notion of causality across a temporal distance as he is with causality across a spatial distance. Wittgenstein's student Norman Malcolm has taken the idea quite seriously, see his *Memory and Mind* (Cornell University Press, 1977), chpt 7. Malcolm's book is probably the most thorough defense of Wittgenstein's approach to memory available.
6. Zettel, #613. Wittgenstein remained adamant about this: "Indeed, I confess, nothing seems more possible to me than that people some day will come to the definite opinion that there is no copy in either the physiological or the nervous systems which corresponds to a particular thought, or a particular idea, or memory": *Last Writings on the Philosophy of Psychology* vol. I, #504, trans. C.G. Luckhardt and Maximilian A.E. Aue, (Basil Blackwell, Oxford, 1982).

15. Unless otherwise indicated translations from Plotinus' *Enneads* follow those of A.H. Armstrong in the Loeb Classical Library edition (7 volumes, Cambridge, Massachusetts: Harvard University Press, London 1966–1988).
16. IV.7.6.43–46. Sextus Empiricus attributes a similar argument to Chrysippus: "For if the soul in experiencing a presentation is stamped like wax, the most recent change will always obscure the previous presentation, just as the outline of the second seal wipes out the former one. But if this is the case, then memory, which is a storehouse of presentations, is destroyed and so is every craft": *Adversus Mathematicos* 7.372–373, trans. Brad Inward and Lloyd Gerson, in *Hellenistic Philosophy* (Hackett, 1988), p. 92.
17. See IV.7.8.19–23. Plotinus himself is not above comparing the soul to some kind of "surface" but it is for him better likened to the reflective surface of a mirror than a wax tablet (see I.4.10.6–24). A mirror, after all, is never affected intrinsically by what it reflects. Even when dusty it can always be polished.

22. *Wittgenstein and the Vienna Circle: conversations recorded by Friedrich Waismann*, ed. and trans. Joachim Schulte and Brian McGuinness (Oxford Basil Blackwell, 1979), p.48.
23. *Ibid.* p.53.
24. "Does he know that it is remembering because it is caused by something past? And how does he know what the past is? Man learns the concept of the past through remembering": *Philosophical Investigations*, #231e, trans. G.E.M. Anscombe (Basil Blackwell: Oxford, 1958). Joachim Schulte provides valuable elaboration upon Wittgenstein's notion of memory as source: "If I remember a certain passage from the Fourth Symphony by Brahms and hear the sequence of tones before my mental ear, do I listen to a reproduction of a certain performance? If yesterday I heard the Fourth conducted by Kleiber and the day before yesterday I heard it conducted by Karajan, then my memory is likely to be influenced by both, and it may even be that I am able to reproduce—that I am able to call to mind—differences between those two performances. But no matter what kinds of trace may be there in my nervous system, I am the one now 'playing' Brahms' Fourth Symphony. It is my present performance—what I am doing now—which makes memory such a puzzling thing and at the same time such an important agency": *Experience and Expression: Wittgenstein's*

- Philosophy of Psychology* (Clarendon Press, Oxford, 1993), pp. 118–119.
25. Indeed memory is so creative for Plotinus that we not only remember what we have become but become what we remember; see IV.4.3.5–6.
  26. IV.6.3.4.
  27. IV.6.3.54–55.
  28. III.6.2.43–44.
  29. IV.6.3.3–5.
  30. Walter Stace expresses Plotinus and Wittgenstein's position perspicuously: "What is it that makes the mind able to remember? For what information does this question enquire? Does it suggest that some other "thing," which is not itself mind, from the outside pushes the mind into remembering or enables it to remember? And if we found this other thing, should we then be asked what third thing enables this thing to enable the mind to remember? Since memory is one of the essential characters of consciousness, these questions are like asking what it is which enables a triangle to be triangular": *The Nature of the World* (Princeton University Press, 1940), p. 59.
  31. There is a sense in which both Plotinus and Wittgenstein take wonder not merely as a stimulant but an end for philosophizing. This is well-expressed by Plotinus "...we do not think it proper to investigate ordinary things, nor do we disbelieve in them, but we disbelieve in the detailed working of the other powers which are out of the ordinary and encounter the extraordinary with wonder, though we should wonder at these ordinary things too if we were unfamiliar with them and someone presented a detailed account of them to us and explained their powers." IV.4.37.7–12 (Armstrong, modified). A similar sentiment is found in Wittgenstein: "The aspects of things that are most important for us are hidden because of their simplicity and familiarity. (One is unable to notice something—because it is always before one's eyes.) The real foundations of his enquiry do not strike a man at all. Unless that fact has at some time struck him.—And this means: we fail to be struck by what, once seen, is most striking and most powerful": *Philosophical Investigations* #129. For more on the centrality of wonder to Wittgenstein's thinking see Gordon C. F. Bearn's *Waking to Wonder: Wittgenstein's Existential Investigations* (SUNY Press, 1997).
  32. Karl Popper has called the view which Plotinus and Wittgenstein challenge "the bucket theory of the mind", see his essay "Realism" in *A Pocket Popper* (Fontana, 1983), p. 221. In a similar vein Gabriel Marcel has warned against being duped by material images in studying the mind—"we persuade ourselves falsely that to understand, for the mind, is like, for a vessel, being filled with a certain content": *The Mystery of Being* vol. 1, (University Press of America, 1950), p.56.

# The Neoplatonism of Dean Inge

R. Baine Harris

William Ralph Inge (1860–1954) is already known by most Neoplatonic scholars through his monumental study *The Philosophy of Plotinus*. His public career extended for more than sixty years and he was one of the best known Englishmen of his day. Trained primarily as a classicist, he became interested in philosophy in his mid-thirties, finally settling in his mid-forties upon the thought of Plotinus, and remaining a serious student of Neoplatonism for the rest of his life. In addition to his work on Plotinus, he is the author of more than forty-five major books and an equal number of pamphlets and scholarly articles. His first major book, was published in 1899 and his last article was published in 1954 when he was 94. In his books, he sets forth a form of Christian Platonism that is roughly in the same tradition as Augustine, Erigena, Eckhart, and the Cambridge Platonists, and especially the latter.

His Neoplatonism is to be found mainly in his ontology and epistemology, although there are distinctive Neoplatonic sub-themes running throughout his theology, psychology, and ethics. In contrast to Erigena, he should be regarded as Neoplatonic Christian rather than a Christian Neoplatonist, since he returns to distinctively Christian commitments in the final stages of his theory of salvation, his theology, and his ethics. Contrary to Erigena, he does not attempt to provide a Christian religious meaning within a metaphysical framework that is Neoplatonic in its architectonic structure, but forms his own idealistic synthesis without an appeal to a Neoplatonic logic or dialectics.

Inge saw one of the main intellectual difficulties of Christianity in the modern age to stem from the attempt to present it purely as a religion and more specifically, the effort to present it apart from its inherent Neoplatonic ontological element. Without a metaphysics, he believed it will not be able to compete with its rivals.<sup>1</sup>

In the last chapter of his major book on Plotinus he writes:

Our task is very much the same as that which was laid on Plotinus and his successors in their day. They also had a precious tradition to preserve; and, as happens so often in human life, they won their victory through apparent defeat. They resisted Christianity, and were beaten; but the Church carried off so much of their honey to its own hive that Porphyry himself would have been half satisfied if he had seen the event. For us, the whole heritage of the past is at stake together; we cannot preserve Platonism without Christianity, nor Christianity without Platonism, nor civilisation without both.<sup>2</sup>

**Ontology.** In his own ontology Inge distinguishes between essence and existence, but treats the distinction as polarity. "Reality" is a higher existence and "existence" is a lower reality. He does not postulate two worlds, one of substance and one of shadow, nor set an unreal natural order in opposition to a real supernatural one.<sup>3</sup>

The visible world is no deceiving phantom; it is the creation and copy of a higher sphere of existence, but the two are numerically one. Reality is constituted by the *laws* that make up the content of the mind of God. These laws are to be identified with the eternal values and are to be regarded as existents as well as ideals for they are powers as well as creative values.<sup>4</sup>

He regarded Truth, Goodness, and Beauty to be the most real elements in our world of experience and he viewed them as extensions of the deity. As such, they are literally the most real things in the world. He writes:

Things truly *are* in proportion as they "participate" in Goodness, Truth, and Beauty. These attributes of Reality, which so far as they can be known, constitute its entire essence; that is today, they belong to a sphere of supra-temporal and supra-spatial existence, which obeys laws of its own, and of which the world of common experience is a pale copy.<sup>5</sup>

Value and reality are ultimately identical. To be is to have value and the eternal values have objective existence. Our world of existence, our world of process and becoming, is built up out of our own valuations of existence. Inge comments:

Existence is itself a value, and an ingredient in every valuation; that which has no existence has no value...It is quite certain that we can think of no existing world without valuation. The ultimate identity of existence and value is the venture of faith to which mysticism and speculative idealism are committed. It is indeed the presupposition of all philosophy and religion...<sup>6</sup>

The world does not have its own independent objective existence. We contribute something to its existence in the act of knowing it. Valuation is necessary for existence to have meaning and the valuation of existence leads to the production of a scale of values.<sup>7</sup>

He concludes that there could be no greater error than to leave the two "judgments," that of existence and that of value, contrasted with each other or treated as unrelated in our experiences and he frankly admits that the identification of existence and value on their various levels can only be asserted as an act of faith.<sup>8</sup>

**Epistemology.** In his own epistemology Inge asserts that there are levels of knowledge and knowing. The sort of knowledge gained through the senses is adequate for some levels of understanding, but not for the highest mental judgments, such as the understanding of human personality, for example. Knowledge gained through logical and psychological operations may be adequate for scientific purposes, but not for metaphysical judgments. The level of knowing must correspond to the level of being of the object involved and knowledge of the supreme principle is different in type from all other types of knowledge.

**Faith.** All forms of knowing including scientific knowledge must begin with some element of faith, since all values must begin with an act of faith. Faith differs from "existential knowledge" in that it entails the recognition of an objective, external, and ideal standard of value by which things given in experience may be judged.

Inge further asserted that knowing and valuing are inseparable. Knowledge cannot occur apart from some form of evaluation and all affirmations of knowledge have some valuations implicit in them. Essentially, he claims that the level of knowledge is dependent upon the manner of evaluation. Valuation is not the direct product of either the will or the intellect, but is a primitive experience arising normally in our response to the ideal as we

encounter it in human experience. It is neither an intuition nor a "pure feeling."

**Knowledge.** The first level of knowing is the level of faith. The second level, the level that is usually called knowledge, is the level of relational knowledge and it is here that both science and metaphysics are produced. This stage is not in opposition to the primitive faith-state, but it exhibits a higher level or organization. It is sub-divided into two operational levels: 1) the development of the discursive intellect, and 2) the development of reason. The first aims at the achieving of a logical synthesis, and the second aims at the total synthesis of the whole of human experience. The highest function of the higher reason is the production of a metaphysics in which judgments of fact and judgments of value are fully reconciled. In order for science to be converted into metaphysics, the higher reason, or *Nous*—the total knowing of the whole person—must be engaged to exercise judgments that could not be made within the limits of logic alone. Facts are not reduced to values and values are not reduced to facts, but both are highly integrated in producing many valued, i.e., metaphysical judgments.

The third and highest level of knowing is the level of love. Relational knowledge at its best cannot provide the sort of complete knowledge for which the human spirit longs, but complete knowledge is possible through love. Such knowledge is not complete in the sense of being an adequate human experience. It can come only as the product of considerable personal intellectual discipline and spiritual growth.<sup>9</sup>

Although this form of supra-relational knowledge is the very highest form of faith and knowledge, it cannot be adequately characterized as a form of either one of them. Although no exact line of demarcation can be drawn between relational and supra-relational knowledge, the latter state may be said to occur when the "mind in love" rises above the level of *Nous* so that *Nous* passes into a higher level of synthesis than a synthesis of facts and values. At this point there is a complete harmony of feeling, intellect, and will, and thus, the complete unification of the personality.

Inge does not believe that knowing at the level of love resolves the various intellectual difficulties that existed on a lower level of knowing. It does not provide solutions to logical antinomies and it does not eliminate the laws of logic. Neither does it make metaphysics unnecessary. It transcends, but does not dissolve the

various logical and metaphysical issues involved in relational knowledge. It does not annul the distinction between knowing and being, and between thought and its objects. In perfect knowledge there is perfect correspondence of thought and object, but this is not the same as ontological identity. This supra-relational level of knowing, however, is the basis of religious knowledge. More divine mysteries can be revealed through love than through active work or metaphysical judgments.

**Theology.** Inge is essentially Augustinian in his theology. He accepted the distinction between the God of Religion and the God of Philosophy and concluded that Christianity has never been deficient in its conception of the former, whereas it has been in the latter at various times, including the present age. He believed that Christianity was able to exist without a well defined philosophical theology for its first three centuries but was provided with one only through the aid of the Middle Platonists and Plotinus. Essentially, what Plotinus contributed to Christianity through Augustine and others was the notion of a truly transcendent Absolute. Thus, Inge saw Christianity's chief contemporary theological deficiency to be the product of various modern attempts to depart from the basic Platonic-Neoplatonic conception of God that has been a part of Christian philosophy since Augustine.

*God as the Absolute.* Although Inge does not hold to the idea of God's absolute immutability (as is suggested by both Plotinus and Augustine), he rejected the Hegelian Absolute and all forms of theism that allow a fundamental change in the character or essence of the deity. For Inge, God is Absolute in the sense of being self-sufficient. He exists both in and apart from the created order and he is not dependent upon it for his essential attributes or for his continued existence. He is, however, effected by the universe to some extent and is capable of being moved by events that occur within it, including the decisions of men, even though his nature is not severely altered nor his purposes frustrated by these decisions. Late in his career he decided to abandon his early use of the word "Absolute" in reference to the deity.<sup>10</sup>

*God and the World.* According to Inge, the relation between God and the physical universe is transitive, asymmetrical and irreflexive. God is essential to the existence of the world, but the world is not essential to God's nature or existence. It is but the expression of his mind and the field in which his thoughts and

purposes are actualized. Anything we learn about the natural universe teaches us something about the nature of God, since the two are not separate entities. God is immanent in the world, but the world is not immanent in him.

*God in the World.* Inge clearly says that Platonism alone, including Neoplatonism, cannot provide an adequate conception of God and needs to be supplemented by the Christian doctrines of the Incarnation and the Cross, both of which are compatible with it, although not inherent in it.<sup>11</sup> The doctrine of the Incarnation provides an added dimension to the idea of God not foreseen by the Platonists, for not only is God immanent in all instances of Beauty, Truth, and Goodness, he is also immanent in flesh, in historical humanity, and in tragedy and suffering. The full doctrine of Jesus Christ as the Logos, Inge believes, bridges the gap between an Unchanging God and a changing world and simultaneously allows for both Divine Transcendence and Divine Immanence. In Jesus Christ the Platonic ideals of Wisdom, Goodness or Perfection, and Beauty are converted into the simple assertion that God is love. Without the doctrine of the Cross—namely, the thesis that Divine Goodness necessarily leads to Divine Self-sacrifice—there is no Christianity.<sup>12</sup>

*The Nature of Man.* Like Ficino, Inge returned to the ancients for his basic inspiration, minimized asceticism as an ideal, affirmed man as a legitimate part of nature, upgraded freedom of choice, and affirmed the essential identity of philosophy and religion. In fact, one of his main theses, that early Christian philosophy “put the capstone in the arch” of Greek philosophy, had already been stated in almost identical form by Ficino.

As a Christian theist under the strong influence of Plotinus, he could not regard man as the measure of all things nor as the crown of creation. Yet he does take the dignity of man quite seriously. Like Plotinus he insists that it is the conception of man as a soul that allows a metaphysical ground for establishing his inherent worth, for unless man can be viewed as having some transcendental element that is valued by something more than man, he may only be prized as a tool for the working of human ends. Like Plotinus he establishes the worth of man in his inherent literal identity with God through the spark of divinity that he believed to constitute an essential part of human personality.

*Man as Body.* According to Inge, man is simultaneously body, soul, and spirit and cannot be adequately defined on an exclusive material, psychical, or spiritual basis. All of his three natures are operative in every situation in which he finds himself in the present world order.<sup>13</sup> Man is “a living mirror of the universe.” He recognized that there is an element in human nature that mitigates against the development of man’s highest potential. His position is that the body as the body is not necessarily evil even though there are elements within the body that work against the development of the soul. Following St. Paul he characterized this as the flesh at war with the spirit, but he also teaches that the body itself can be reformed as a spiritual body. Following Plotinus he regards that which is natural as basically an extension of the soul and hence potentially redeemable, even on its lowest levels. Just as the soul is reformed and refined through its conformity to the spirit, so the body is improved by the working of the spirit through the soul upon it.

*Man as Soul.* In the strictest sense Inge did not believe in the existence of a soul as a being, i.e., as a self-existing individual that is transcendent and everlasting. Instead, he regarded it as the *function* of being alive in space and time and the result of the interplay of feeling, will, and thought. Man’s psychical life embraces much more than his empirical self, which is generally stable, but not absolutely stable in man.<sup>14</sup>

Although the human soul does not have independent existence, self-determination, and full self-consciousness, it does have an independent value. His position was that the individuality of the soul is a fact of experience and history, even though it may not necessarily be considered to be an eternal possession. Our soul is not something we own or control or do with as we please. Man is thus only potentially an individual. His individuality is grounded in his being in the image of that which has greater individuality than he does. Although the unity of soul-life is not realized in space and time, it is realized in the Eternal World.

*Man as Spirit.* Inge always uses the word “spirit” to signify the divine and when he says that man is spirit he means only to affirm that man possesses some element of the divine nature. For Inge, spirit is not separate from the soul, but it is not the soul in its normal operation as the empirical self. It is the “divine core” of the soul, the highest and most real aspect of its being.<sup>15</sup> It is the soul at

its best, just as the flesh is the soul at its worst. It is the immanence of the Divine in the human heart.<sup>17</sup>

Essentially Inge's view is that man is potentially spirit, but rarely actually spiritual. He is not an eternal spirit, but possesses enough of the divine to be spiritual. He does not possess a spirit any more than he possesses a soul. His spiritual essence, which is his true essence, is hidden in the normal operation of the empirical self.

*Man as a Person.* The essence of Inge's Neoplatonic Christianity is to be found in his doctrine of man as a person. In contrast with the Personal Idealists,<sup>18</sup> he held that man cannot be defined as a self-conscious ego, that is, as an individual, or as a person existing on his own and within his own powers. Inge held that man *is* a person, but he is only what he is to God. He is that particular individuality that he has in the mind of God. His worth is his worth to God and his personhood consists in the particular role that he plays in the life of God. This explains why he cannot be said to *be* a body, a soul, or a spirit, even though he has bodily, psychical and spiritual natures. It further explains why it is not easy for him to know his own true personality.

This idea of personhood, Inge believes, is the basis of the Christian teaching of the dignity of man. Man's worth cannot be located in his being a biological organism or a psychical or spiritual monad and it is not to be found in his worth to society, or to the state, or even to himself. It is to be found only in his worth to God, a theme that raises the level of his dignity beyond that to be found in various utilitarian social philosophies. The practical result of such a view is that it guarantees the notion of man as an end.

Inge further makes a distinction between man as a personality and man as a person. The former may be described and defined as a process, but the latter is an ideal and is only rarely grasped. It is an aim of religion to assist man in adjusting his personality in accordance with his true personhood, to adapt his physical and psychical behavior into conformity with his spiritual nature. This is the only way man can realize his own true self as a person.

*Human Salvation.* Man's salvation, according to Inge, is still much more than the refinement of his body and soul in terms of his spirit. Although he follows Plotinus in his journey for self-improvement through ethical self-culture, the elimination of the power of the passions, and the control of the will, the final stage of

salvation is somewhat different from that suggested by Plotinus. Instead of the return of the alone to the Alone or the reduction of the non-divine elements, Inge suggests rather the higher integration of the divine elements, with the human. Salvation for Inge is "Emmanuel,"—God with us, a union that does not dissolve the distinction between the individuality of the divine and the human, but instead intensifies the individuality of the human in the presence of the divine. The individual character of the divine is preserved as divine and the individual character of the human is preserved as human. Inge writes:

Our inner life should be a progressive transformation of soul into spirit. Spirit is the divine part of our nature, potentially but not actually ourselves...We do not believe in the absorption of personality in an impersonal Absolute; the 'I' and 'Thou' relationship remains to the end, otherwise love and worship would cease...<sup>19</sup>

Religion, for Inge, is that attitude and activity that leads man to come to realize his own full personality. It is whatever assists man in finding his own "conscious existence in God." This unification of the personality cannot be achieved through the integration of self-consciousness within the limits of the empirical self. It can only be achieved on a *religious* basis, namely, through the identification of the individuality of the self within the universal life. Inge writes:

To attempt to find self (the individual) without God (the universal), says Professor Ritchie, is to find—the devil. The individual assumed by the psychologist, and by the common political and ethical theories, is a half-way abstraction of the ordinary understanding, a bastard product of bad metaphysics and bad science. Christianity...from the very first rejected it.

This paradox of the spiritual life implies that the universal and individual are abstractions, each of which would collapse without the other. Indeed, the union of individuality and universality in a single manifestation forms the cardinal point in personality.<sup>20</sup>

Although religion involves the loss of the ego, it does not lead to the complete loss of self-hood. Quite the contrary, it leads to the discovery of one's self, that is to the discovery of the true nature of one's own individuality in terms of the role one plays in the universal life.

Finally, Inge's humanism is to be seen in his belief in the essential unity of philosophy and religion. From a distant perspective his whole career may be seen as an effort to bring these two ancient disciplines closer together in the modern period. This he proposed to do by giving philosophy a considerably broader role than that allowed to it by most philosophers of his day, returning to the ancient conception of it as an *ars vivendi* in which all forms of knowledge, scientific, religious, and otherwise would be synthesized. His dialectic is nearer to Plato's than to the dialectic of Plotinus, but he agreed with Plotinus that the final vision of truth occurs beyond the limits of the dialectic. To say the least, Inge believed that in their final phases, philosophy and religion are identical. In his book on the philosophy of religion, *God and the Astronomers*, he expressed his conviction that it is possible to work out a harmony among science, philosophy, and religion if science is kept within its limits and not allowed to expand into metaphysics and if philosophy and religion do not take on the character of a science.

Dr. Rudolf Metz in his *A Hundred Years of British Philosophy*, written in 1938, gave the following assessment of Inge's contribution:

...The real import of his work is...in his having focussed the intellectual life of England upon historical forces and powers which had hitherto been in part buried and hidden...Present-day English philosophy...owes him ■ noteworthy widening of its cultural horizon, the sharpening of its vision for far views over space and time, a training in genuine thought about and insight into history and the philosophy of civilization. Inge seems to me to feel more vividly than any other contemporary British thinker that philosophy is not a self-sufficient detached affair, but an organic member of the general culture of the mind, in which it is included and which is operative in it.<sup>21</sup>

Inge founded no school of thought and there is little evidence that he has any remaining major philosophical disciples. He once said that the nation that first finds a practical reconciliation between science and idealism is likely to take the front place among the peoples of the world. His pioneering efforts in pointing out the formula for this reconciliation are still worthy of our consideration.

## Paul Tillich's System and Neoplatonism

John Charles Cooper

### Introduction

The German-American Philosopher-Theologian, Paulus Oskar Johannes Tillich (1886-1966) was known during his lifetime as a responder to the new in the Twentieth Century, a welcomer of the insights of artists and architects, depth psychologists and scientists. Above all, Tillich's "System" was a response to the questions raised by modern people; questions he saw reflected in the often tortured teachings of Nineteenth and Twentieth Century Philosophers. Both liberal defenders and conservative attackers of Tillich's contributions acknowledge that much of his conceptual apparatus is derived from G.F.W. Hegel (with his Absolute Idealism), with a strong dose of Karl Marx and a leavening of Sigmund Freud and Carl Jung.<sup>1</sup> It is therefore somewhat odd, perhaps, to write about Tillich's System and Neoplatonism. Odd, that is, to anyone not familiar with Tillich's three volumes of Systematic Theology<sup>2</sup> and, in particular, with his exposition of the Holy Trinity and the Logos and with his concept of revelation "as ecstatic reason."<sup>3</sup>

### I. The Trinity

Tillich well knows that the Trinitarian Doctrine of God's hypostases derives from Plotinus,<sup>4</sup> who believed the hypostases in God are Three and no others. These Three are The *One*, beyond being and essence; the *Mind* or *Nous*, the Unity of Being and Thought; and the *Soul*. As Giovanni Reale says:

...The determination of the principle according to which the successive hypostases proceed from the first hypostasis and according to which the sensible cosmos itself proceeds from the last

hypostasis as well as the determination of the nature of this process is the new and distinctive trait of Neoplatonism.<sup>5</sup>

Tillich, of course, goes on to develop the specifically Christian doctrine of *Creatio ex nihilo*, and so does not follow Plotinus in his pantheism.<sup>6</sup> Tillich does, however, observe:

The divine life is infinite mystery, but it is not infinite emptiness. It is the ground of all abundance, and it is abundant itself. The consideration of the Trinitarian principles is not the Christian doctrine of The Trinity. It is a preparation for it, nothing more. The dogma of The Trinity can be discussed only after the Christological dogma has been elaborated.<sup>7</sup>

For Tillich, the Trinitarian hypostases are necessary if one is to speak of a living God. Interestingly, the revelation by which this God is made known is called "ecstatic reason," which is similar to the ecstasy by which Plotinus believed he had become God, if only partially and fragmentally, as both he and Tillich would have observed. Tillich mentions Ecstasy in *The Systematic Theology* twenty-five times, with one discussion running for eight pages.<sup>8</sup> While Dean Inge holds that "the importance of ecstasy in Neoplatonism has often been much exaggerated;"<sup>9</sup> it is no exaggeration to say that Plotinus valued ecstasy above everything else, perhaps because it was a rare experience. As Inge says: "When in this state the Soul would exchange its present condition for nothing, no, not for the very heaven of heavens; for there is nothing better, nothing more blessed than this."<sup>10</sup> Tillich's conception is almost the same, with this caveat, for Tillich there is sin and estrangement between the human and the Divine (unlike Plotinus) and so the Divine Spirit must invade the human spirit (in grace):

If the Divine Spirit breaks into the human spirit...it drives the human spirit out of itself. The spirit (small "s")...is driven into a successful self-transcendence; it is grasped by something ultimate and unconditional. ...'Ecstasy' is the classical term for this state of being grasped by the Spiritual Presence. It describes the human situation under the Spiritual Presence exactly.<sup>11</sup>

Tillich remarks in the same place:

...The revelation of the finite to that which is infinite...is incommensurable....On the other hand, there is no way to express any relation to the divine ground of being other than by using finite material and the language of symbols.<sup>12</sup>

This is, of course, the same position as St. Thomas Aquinas: the *Analogia entis*.<sup>3</sup> Essentially, Plotinus, Inge, Aquinas and Tillich all mean that God is ineffable, beyond comprehension, wholly other (as Karl Barth might say<sup>14</sup>). Tillich suggests that we might overcome the inevitable limitation on all attempts to express the relation (of the infinite) to the ultimate by radically qualifying the metaphor of "dimension," as in the expression, "the dimension of depth" or "of the eternal." Such an expression would mean, for example, "the dimension in which all dimensions are rooted and negated and affirmed." Tillich notes that "this transforms the metaphor into a symbol."<sup>15</sup>

Edward D. O'Connor in "Paul Tillich: An Impression," in *Paul Tillich in Catholic Thought*<sup>16</sup> observes:

But it is patent from Tillich's writings that he does not mean by *symbol* what St. Thomas means by *analogy*....Symbol and analogy are not the same thing; two beings are analogous by reason of an 'essence'...in both of them...But we freely take one being to symbolize another because of some likeness or association between them....

O'Connor maintains that "the fact that he (Tillich) thinks that there is nothing more in analogy than in symbol is a convincing sign that he is not thinking on a truly ontological level, but on a more imaginative level..."<sup>17</sup> While O'Connor does raise some interesting points, his essay ends in a general attack on Protestantism for being weak in Metaphysics, from Luther to Tillich. Incredibly, he offers submission to ecclesiastical authority and monastic renunciation of the world as a corrective. In this, O'Connor sounds more like Plotinus than Tillich ever does.

Much more appreciative—although critical—of Tillich is George H. Tavard in *Paul Tillich and The Christian Message*.<sup>18</sup>

To say 'that God is the Infinite, or the Unconditional, or Being-itself' is no longer presented as a non-symbolic statement. Rather, 'these terms precisely designate the boundary-line at which both the

symbolic and the non-symbolic coincide. Up to this point every statement is non-symbolic....Beyond this point every statement is symbolic...the point itself is both symbolic and non-symbolic."<sup>19</sup>

In sum, Tillich points towards mystical participation in the Divine "ground" of reality. The Divine and the experience, ecstatic and form outside the self, is ineffable, beyond words, as both Plotinus and St. Paul<sup>20</sup> agree.

## II. The Logos

From the time of the early Stoics, through the Academy, to the Neo-Stoics and Neo-Platonists, the concept of The Logos played a role in Greek Philosophy. While it is true that *any* Christian Theologian or Philosopher of Religion *must* deal with the Trinity and the Logos, Tillich spends a great deal of time in dealing with these concepts in depth.<sup>21</sup> For Tillich, "Logos" is the principle of the divine self-manifestation in God as well as in the Universe, in nature as well as history."<sup>22</sup> He calls The Logos "the main tool for the Christological work of the Church."<sup>23</sup> Tillich continues by referring to the Stoics for whom the Logos unites cosmological and religious elements. "It unites rational structure and creative power. In Philo and the Fourth Gospel the religious and symbolic quality of the idea of the Logos prevails."<sup>24</sup> Tillich gladly acknowledges Heraclitus as the creator of the Logos doctrine and declares that: "In Philo the motif is the unapproachable mystery of God which demands a mediating principle between God and man...."<sup>25</sup> This is the Logos.

The influence of Philo of Alexandria upon Tillich is clear enough. Plotinus' influence is less than clear. That Plotinus and Tillich shared a similar approach to theology seems clear<sup>26</sup> but Plotinus' use of "one," "mind" and "soul" (rather than Logos, Soul is used for intelligence or Reason) in designating the Three Divine hypostases is very different from Tillich's usage. The similarity of approach of the two thinkers is revealed by Emile Brehier's comment on "The Fundamental problem in the philosophy of Plotinus":

All interpreters agree in recognizing in Plotinus the coexistence of two orders of questions: first, the religious problem concerning the

destiny of the soul...; and second, the philosophical problem of the structure and rational explanation of reality.<sup>27</sup>

However, we may take a clue from St. Augustine, the Father of Christian Theology and himself a Neoplatonist, who holds that Plotinus determined that at the very beginning of the process of emanation, the One (Ultimate Reality) produces an image of itself in which it knows itself. This is "The Intelligence," which St. Augustine identifies with the Christian Trinitarian Logos, The Christ.<sup>28</sup> Once this identification is made—and Tillich was aware of it—we may conclude that Tillich is as much influenced by Plotinus in his doctrine of the Logos as he is in the doctrine of the Trinity. Indeed, St. Augustine read Plotinus' One as the Father; The Intelligence as the Logos or Son; and the Soul as the Holy Spirit.<sup>29</sup> This understanding underlies Tillich's Vol. II, which is the doctrine of Christ. Tillich even makes the claim that the Biblical reports about Jesus do not psychologize, they ontologize.<sup>30</sup>

## III. Ecstasy/Ecstatic Reason

Tillich once denied that there is a knowledge-content in religious symbols, repudiating Ernst Cassirer's theory of pansymbolism:

*The non-symbolic element in all religious knowledge is the experience (emphasis mine) of the Unconditional as the boundary, ground, and abyss of everything conditional. This experience is the boundary—experience of human reason and therefore [it is] expressive in negative-rational terms. But the Unconditional is not God (emphasis mine). God is the affirmative concept pointing beyond the boundary of the negative-rational terms and therefore is itself a positive-symbolic term.*<sup>31</sup>

James Luther Adams declares that "for Tillich, the symbol represents 'existential truth,' that is, a truth toward which one cannot have the spectator-attitude, and to which one must surrender in order to experience it. In this sense the 'symbols provide no objective knowledge but yet a true awareness,' namely, of the *mystery* (my stress) of the ground, which never can become an

object for a subject, but that draws the subject into the object thus overcoming the cleavage between them."<sup>32</sup>

Adams later remarks that "Tillich exhibits affinity to Boehme," the medieval mystic.<sup>33</sup> Certainly, Tillich's is a mystical way of understanding the decisive experience of revelation, that is the essence of religion. In his mystical depth, Tillich is much like Plotinus.

In *Systematic Theology*, speaking of "the depth of reason," Tillich observes: "The depth of reason is the expression of something that is not reason but which precedes reason and is manifest through it."<sup>34</sup> Interestingly, Tillich goes on to discuss Nicolaus Cusanus and his Catholic Mysticism. Later he declares that "A revelation is a special and extraordinary manifestation which removes the veil from something which is hidden in a special and extraordinary way.... A genuine mystery... is experienced in an attitude which contradicts the attitudes of ordinary cognition. The eyes are 'closed' because the genuine mystery transcends the act of seeing... mystery characterizes a dimension which 'precedes' the subject-object relationship."<sup>35</sup>

One can only refer to the *experience* of revelation as "Ecstasy."<sup>36</sup> "Ecstasy" points to ■ "states of mind... in which reason is beyond itself, beyond the subject-object structure."<sup>37</sup> It is induced by the "ontological shock," i.e., an experience of the original fact that there is *something* and not *nothing*.<sup>38</sup> Although Ecstasy is not a product of reason, it does not destroy reason, either.<sup>39</sup>

In considering whether Plotinus and Neo-Platonism are influences upon Tillich's System, we need to keep in mind two words above all: *Experience* and *Ecstasy*. We find that Tillich denies all revelation not based upon experience, and sees the genuineness of Christianity in the experience of the transforming power of the Symbol of The Christ. For Tillich, too, Philosophy, which asks the questions of human existence, finds its answers in Theology, not in doctrine, but rather in the experience when reason is driven to its ontological depths, becoming ecstatic reason. This means reason is driven outside itself, to unite with Being-Itself, much as the prophet is beside himself or suffers from divine madness. To find the source or model of such a view of reason (and human fulfillment), we need look no further than Porphyry's *Life of Plotinus*, for his quote from Apollo's Oracle about Plotinus:

So to this godlike man, who often raised himself in thought, according to the ways Plato teaches in the *banquet*, to the First and Transcendent God, that God appeared who has neither shape nor any intelligible form, but is throned above intellect and all the intelligible. I Porphyry, declare that once, in my sixty-eighth year, I drew near and was united to Him. To Plotinus 'the term even near was shown': for his end and term was to be united to, to approach the God above all things. Four times while I was with him he attained that term, in an unspeakable actuality and not in potency only.<sup>40</sup>

What "happened" to Plotinus four times, and to Porphyry once, Tillich declared can and does happen to Christians due to the surpassing power of the symbol of The Christ. Like Paul, who once declared "...whatever is true, whatever is honorable, whatever is just, whatever is pure, whatever is lovely, whatever is gracious, if there is any excellence, if there is anything worthy of praise..."<sup>41</sup> all these belong to Christ and the Christian, so, too, Paul Tillich, in his *Systematic Theology*, claims everything true and good for his faith. And among the best that Tillich found in our common history was Plato and Plato's spiritual interpreter, Plotinus, of Alexandria and Rome.

# The Contemporary Christian Platonism of A.H. Armstrong

Jay Bregman

The Christian Platonist and Neoplatonic scholar A. H. Armstrong is especially well known for his English translation of the *Enneads* of Plotinus, his book, *The Architecture of the Intelligible Universe in the Philosophy of Plotinus*, as the editor of the *Cambridge History of Later Greek and Early Medieval Philosophy*, other books and numerous articles, many of these gathered in the collections *Plotinian and Christian Studies* and *Hellenic and Christian Studies*. (See notes.) In his works for some sixty years he has also expressed his personal Platonic religious outlook. Most significant among these are his "apophatic" or "negative theology," a rather un-orthodox religious openness combined with Socratic skepticism as well as with traditional religious practice, a positive view of the cosmos reflected in his sense of the universe, itself an epiphanic icon of the divine.

Armstrong's scholarship has been well received and has made a major impression on the learned world seriously concerned with Late Antiquity and Neoplatonism. His personal religious ideas are perhaps less well known. In them he presents viable alternatives to rigid exclusivist Orthodoxies, and he builds bridges between East and West: Neoplatonism is the most natural and advantageous point for a Westerner to approach Eastern, especially Indian, thought; he offers living options within the tradition, that do not deny or negate historical criticism, modern concerns or modern science. His feeling for the rhythms of the cosmos, nature and "the beautiful" speaks to modern sensibilities, concerns and problems, while it retains a creative relationship to the tradition; especially to the Hellenic rather than the Biblical elements of our "inherited conglomerate."

Beginning in the mid 1930's, as a Roman Catholic convert, Armstrong's works display developments in Neoplatonic

scholarship as well as his own changing religious attitudes and commitments. In the 1936 "Plotinus and India," a theme Neoplatonists continue to think about, still under the influence of Gilbert Murray and E.R. Dodds, he reflects the old ideas of late antiquity as an "age of anxiety" and the "failure of nerve." Even essentially rationalist Greek thinkers were concerned with ascending beyond the *Heirmarmene*-ruled cosmos and/or unifying with its inner principle. The Gnostics prefer the first, the *Hermetica* and especially Plotinus both of these methods of release; there is no sharp distinction between subject and object and all are deeply influenced by the Hellenic outlook. Yet despite similarities to Vedanta Plotinian pantheism (as Armstrong then called it) and related phenomena need not be Indian in origin as E. Brehier thought. The 1937 "Emanation in Plotinus" takes up the theme of "solar theology" (later so important to the emperor Julian) in Plotinus and the *Hermetica*. *Nous* ("divine intellect") is "*ho ekei Helios*" the sun of the other world and Soul is an intermediary between *Nous* and the visible sun.

During his Roman Catholic period (essentially the 1930's to the 1970's) Armstrong avoided the "party line" of the Christian theological "de-Hellenizers," who blamed the Greeks (especially the Platonists) as the main source for contemporary perceived defects of Christianity: dualism, devaluing of the body and the material world and non-linear therefore non-progressive views of history. Even when he takes the Catholic side in this debate he minimizes the differences and even sees advantages for Christians in the Greek view: "...the Christian, like the Platonist, should apprehend the eternal as present here and now, and should not reserve his hope for the end of the historical processes and the Christian ought to desire as passionately as any Pythagorean or Platonist to be delivered from coming to be and passing away from the cycle of death and generation."<sup>1</sup> Armstrong also perceives common ground for the notions of Platonic *Eros* and Christian *Agape*. The outpouring of the One is not a form of natural automatism; beyond necessity the One gives itself. The impulse of *Eros* comes from above, though the One remains impersonal.<sup>2</sup> The Christian emphasizes history and community more than Plotinus. Even the most individualistic Christian mystic expects to enjoy the Beatific vision in the company of heaven. Yet the mystery of how and why the citizen-souls of the City of God are being assembled

in history, no Christian interpretation of history can solve. For Plotinus, the beginning of ascent must be the exercise of *politikai aretai*. He also has a strong feeling for "the visible universe as a community of living intelligences"; it would hardly be going too far to speak of the "mystical body of the cosmos" in Plotinus. Their refusal to recognize *any* community with the gods of the visible universe was one of his strongest reasons for hostility to the Gnostics. On *this* doctrine, Armstrong notes, Christians could well learn something from Plotinus, "and our traditional doctrine of angels would enable us to do so within the limits of orthodox belief."

In his Roman Catholic period, then, Armstrong's qualified pro-Plotinian position might be thus summarized: Though Plotinus' description of the unity in diversity of *Nous* may have had a powerful influence on the Christian discretion of the unity-in-diversity of the heavenly city, intellect remains an impersonal universal principal, not a community of beatified persons: "And union with the One is *always* unqualified *monou pros monon*."

To some extent during the 1960's and especially the 1970's, Hilary Armstrong moved more and more in the direction of "Hellenic Christianity." By 1981, he had arrived at a religious position, perhaps best expressed in his "Negative Theology, Myth and Incarnation"<sup>4</sup> in which he makes a very sharp distinction between the Hellenic and Biblical, history and myth, and attempts to take the Hellenic side.

This also involved a return to the liberal Christian Platonism encountered in the late 1920's at Cambridge and also a personal *paradosis* from his (more conservative) father, an Anglican clergyman. Indeed, one who accepted a traditional equation of Platonism and the Bible. A form of liberal Christian Platonism, which, he claims to have abandoned in immature and exaggerated reaction to both its defects and virtues for a more conservative form of Christianity and to have only recently fully consciously returned to it.<sup>5</sup>

Platonic philosophy has been a force against the alienated Gnostic attitude, reinforcing elements in traditional Christianity opposed to Gnosticism and opposed to those Gnostic influences which have persisted in the Christian tradition.<sup>6</sup> The Plotinian view of divine hierarchy opposes the austere monotheistic idea of no degrees of divinity: "it is not contracting the divine into one but

showing it in that multiplicity in which God himself has shown it which is proper to those who know the power of God (*theos*), inasmuch as abiding who he is, he makes many gods, all depending upon himself and existing through him and from him"—God comes and brings *the gods* with him.<sup>7</sup>

This Henotheistic/polytheism as a pure Hellene might conceive it—inclusive monotheism for a Christian Platonist, provides a contrast between monotheism in which god communicates divinity (in and through himself) and the "Abrahamic" tradition's exclusive God separated from *His creation*. For the Christians, despite talk of the cosmic function of the Logos and the world-animating activity of the Holy Spirit, the saving work of the Logos is through membership in the Church rather than the Cosmos. This difference, about the religious relevance of the material cosmos and its multiple self-communication and revelation everywhere and always, the ecclesiastical vs. the natural cosmos, Christian anthropocentrism, led the way for modern technological progress and pollution in a de-sacralized world. There is no theophany left for the majority, no divine self-manifestation here below. "We had been set free by the Christianity which most of us had abandoned from the superstition and wisdom of the ancients, set free to try to realize our dreams of a wholly man-centered technocratic paradise, which is beginning to look to more and more of us more and more like hell."<sup>8</sup>

The Christian Hilary Armstrong elaborates "Some Advantages of Polytheism":

The (Hellenes) did not repudiate the gods for the sake of God, the world is a unity in plurality, a harmony of conflicting opposites and alternating rhythms (seasonal) of a dance, rather than a march to a goal. Plotinus' *On Providence* (the greatest ancient theodicy) remains close to the spirit of the tragedians and in *Enn. I, 8*, Plotinus implies the cosmic choral dance in his adaptation of Sophocles view of Colonus to the cosmos: 'All the place is holy, and there is nothing which is without a share of soul' (*Enn. I 8 [5,] 14, 36-37; Soph. O C 54*). I can only say that awareness of God in the natural world is the heart and foundation of any religion I have.<sup>9</sup>

The notion of God as a Person tends to make him one particular among others; the Good always lies over the edge of our thought. We can only construct a multiplicity of inadequate images...the

symbol for reality. The icon is a *sign*, not a likeness, by which he makes himself present. The true Neoplatonist is an *idoloclast* but an *iconodule*.<sup>10</sup> Thus the theologians formulations are "icons" as much as are the artistic "images" of the church and neither can be elevated in status.

The important Eranos paper on "The Divine Enhancement of Earthly Beauties"<sup>11</sup> was written in part as a Hellenic response to the disintegration of our inherited conglomerate. "The beauties of Earth and the beauties of the gods, or the divine...are apprehended together so that earthly beauties stimulate and provide expression for awareness of divine presence, and in turn, the sense of divine presence enhances earthly beauties"<sup>12</sup>; such reciprocal perception is at the root of Neoplatonic aesthetic experience. (see Plato's *Symposium* 210A-212B; *Enn. I.6; V.8*) In this paper Armstrong discusses 1) Archaic/Classical Greek religion, with its ubiquitous but varied sense of concrete omnipresent *numina*; 2) Hellenistic "cosmic piety" somewhat artificially distinguished from 3) Neoplatonic transcendence, which includes and transforms 1) and 2). In the final stages of Hellenism Platonic and poetic religion had come together...Neoplatonists of Athens were the last defenders of the old Hellenic ways of recognizing and worshiping the gods as icons. They also went beyond Plotinus in overcoming dualism—the "feminine other," the dyad, is equal to the monad and both proceed from the One. They were well content that the Platonic imagination should be the old Hellenic imagination, and in fact had never ceased to be.<sup>13</sup> On the ladder of the *Symposium* (from beautiful things to the Beautiful) *all stages remain at every stage* (*Enn. I 3(20)*) and at every stage from beginning to end the universal and absolute beauty is present in particular beauties and is apprehended as what makes them beautiful.<sup>14</sup> The spiritual enjoyment of earthly beauties was most splendidly celebrated in 17th Century England by Armstrong's country neighbor, Thomas Traherne, whose writings he quotes at length<sup>15</sup> and then goes on to point out that "it was above all Plotinus who gave Platonism the form in which it has helped most to make us vividly aware of the *divine presence in the beauties of the earth*."<sup>16</sup>

In the allegory in *Enn. V, 5 (32)*, 18-24 about Ouranos (the One), Kronos (Nous) and Zeus (Psyche) the latter's (as Hadot suggests) preference is for Ouranos—"he is not satisfied with the contemplation of his father but aspires to, we might say, the active

power with which his grandfather established reality in being"—a *hidden preference* in Plotinus for the process of procession, at the root of which is the *bonum diffusivum sui*, the primacy of the generosity of the Good. That even the perfection of Nous—the absolute perfection of Being—is not enough, is ■ striking development of Platonism.<sup>17</sup> Armstrong points out, however, that Zeus also remains in Kronos and even if the Hypostases are distinguished, they are never disjoined. Plotinus himself might have let the sharp distinction vanish.<sup>18</sup>

Finally, the later, Athenian Neoplatonists, went far in overcoming dualism, and in this surpassed Plotinus. Platonic-Pythagorean dualism is never simply a conflict dualism of the Iranian pattern—"light vs. dark" in more or less eternal opposition—it is rather in between the Iranian and the Chinese Yang-Yin Circle. The late Platonists, "by rehabilitating" the account of the feminine principle, the "dark other" brought it over to the Chinese side. The negative statements about this principle are abandoned, both (monad and dyad) are seen as equal, proceeding directly from the One/Good, the father and mother of all that exists, of real being and intelligible cosmos as well as of material cosmos. Though as imperfection "evil" is in ■ sense a result of the "dark other", she still has a necessary and transcendent function.<sup>19</sup> As Proclus puts it in *PL. TH. III.8*, "all unity, wholeness and community of being and all the divine measures depend on the primal limits and all division of generative making and procession to multiplicity come from the supreme unboundedness."<sup>20</sup>

Armstrong summarizes his position as follows:

The recognition of the 'dark other'...can clearly do a great deal to remove the Platonic uneasiness, still apparent in Plotinus, about the beauties of the material world...the point is that at which cosmic optimism becomes...too roseate...and world affirmation...self indulgent, and there is no longer any call to rise to the higher world of spirit. The doctrine of the Athenian Neoplatonists does not deny the evil of the material world...it still preserves something of the ambiguity of valuation inherent in the concept of image. But the image is now very much an icon. It becomes more necessary than ever before for the devout philosopher to be aware of the divine in and through material things and outward observances.<sup>21</sup>

The Athenian Neoplatonists not only practiced Chaldaean theurgic rites, but were champions of Hellenic and all pieties and theophanies. Proclus thought that a philosopher should be the "hierophant of the whole world."<sup>22</sup> In the history of Hellenic and Platonic awareness of the divine in the beauties of the earth the beginning was present in the end. The last defenders of the primeval theophanies were Platonic philosophers.

Today Hilary Armstrong takes his religious stand with Christians whose piety is becoming "pre-Constantinian" and who have abandoned the "Theosdosian model" of universal compulsory Christianity. He has also abandoned religious exclusiveness: "I normally worship God in a Christian Church....But if I came across a Hindu temple, our world's answer to a temple to Graeco-Roman Isis, I should go into it and give true veneration to their holy *images* as *true images* of God."<sup>23</sup>

A figure from late antiquity I consider to be comparable is Synesius of Cyrene (ca370-413CE). Synesius was a well connected Greek gentleman from the polis of Cyrene in Libya. According to Gibbon he had the longest pedigree in history. He came to Alexandria in the 390's to study with Hypatia, the Platonic-Pythagorean philosopher. She "initiated" him into Neoplatonic "mysteries." His famous metaphysical hymns, especially the early ones, suggest the fervor of ■ "convert" to the Neoplatonic philosophy. Whether or not Synesius was somehow Christian, for whatever reason, before he encountered Hypatia's teaching, or, as is more likely, shortly after, by all appearances he remained an Hellenic Neoplatonist in the Hypatia sense and probably didn't care much about what orthodox clergy said or thought. But when he accepted an episcopal appointment in 410 CE he felt obligated to take a position. In *Ep.105* he expresses Platonic reservations concerning Christian dogma: the world was not "created," nor will it ever be destroyed; the human soul pre-exists; the resurrection can only be an allegorical image of a purely spiritual event. After 410 he continued to correspond and confide in Hypatia; and to understand his religion from the perspective of an *inclusive* Hellenic Neoplatonist.<sup>24</sup>

Hilary Armstrong's remarks in correspondence and private conversation clarify the way in which he perceives the religiosity of Synesius in relation to his own. "My religion was never very Jesus-centered—and similar in some ways in my upbringing to

Cambridge Platonists like Henry More...since the Sixteenth Century the Anglican Church has tolerated Christian Platonists, who have sometimes had a good deal of influence." On re-reading Synesius's *Ep.* 105: "One difference struck me among the many which there are between me and Synesius. Synesius believed there was one true religion, the Platonism he'd learned from Hypatia, as opposed to the myths of the demos. This is why for him the main opposition in religion is between philosophical truth and 'myth.' The main opposition for me is between people who claim to know too much about god including all sorts of highly sophisticated people, and those who don't. I am quite addicted to religious 'myths' as long as no one tries to impose them officially. I used to light candles to local goddesses all over the place especially in or near the Alps. I'm more like Amelius than either Porphyry or Iamblichus...I'm inclined to think that both Protestantism and Indian 'spirituality' (not the religion of India as a whole) make the separation between the 'spiritual' world and this one very sharp and hard. This seems to me more like Gnosticism than the platonic tradition...which is why 'icons' or 'theophanies' are important to me."<sup>25</sup>

In recent speculations (*Sphinx* 4) he reflects on eschatological themes from the point of view of an almost purely Hellenic Neoplatonist—but also from a critical/modern/revised-perspective. The soul's *experience* of eternity is emphasized, while the traditional idea of immortality is abandoned or left in doubt. The idea of resurrection is avoided for clear critical reasons, in a way not very far from those of Synesius. It seems philosophically incoherent and fantastic.

Thus Armstrong presents a special though non-dogmatic status for the Christian myth.<sup>26</sup> "Diversity, in my opinion, is co-extensive with all conscious thought and reflection on higher reality. I have lately taken to symbolizing this by the late Neoplatonic doctrine of the Peras-Apeiron (see my "Platonic Mirrors" = *H&C* VI) and in general am more devoted to the splendid diversity of the holy images of the unknowable in this world." He accepts negative theology as such, but from an anti-absolutist perspective. Negative theology may suggest a deep, obscure, anonymous faith in something, a dim awareness that there really is something "behind" and "beyond" all the inadequate concepts and expressions. A radically apophatic faith permits the use in a peculiar way very positive language. Its adherents may thus come to understand the

expressions of their traditional religions, not just as "myths" or "icons" made up by men, but as multiple and varied revelation of images through which the Good communicates "iconically" with all of us, of all religious traditions.<sup>27</sup> "This 'general' or natural revelation—close to Proclus' view of the significance of myth and ritual (see Trouillard, *In Remp.* n.8)—will of course, include human participation, error and inadequacy. This attitude should also be extended to include the statements of dogmatic and philosophical theology, not only poetic and imaginative myth, icons and so on."

Armstrong's personal background suggests comparisons with Synesius: "Some sort of Christian Platonism or Neoplatonism was a natural growth in the soil of a moderately well-read English country vicarage when I was young, which was my native soil...its very difficult to explain the ethos in which one was brought up...."<sup>28</sup> "Classical" and "Christian" *really comprised* a conglomerate. "I think I love the Inherited Conglomerate, think I belong to it, and even see classical civilization to some extent through it, though I'm conscious of the differences, rather as one would love an old house in a splendid landscape, to which one's ancestors had contributed a great deal, in which one was brought up."<sup>29</sup> On the Classical vs. Biblical debate within the Christian tradition: "the only reason why I to some extent believe in and practice unreformed Christianity is that it has been Hellenized enough for me."<sup>30</sup> Armstrong, therefore, is often surprised at the to him somewhat strange penchant for "revived Classical" myths that have been given special significance in the modern world. For example, Archetypal Psychologists, who see the gods as diseases and/or (collective) powers of the Psyche often become "enthusiastic" when they invoke Dionysus. His reaction is that "when they talk to me in this manner they don't seem to realize that they are referring to an old friend of mine."<sup>31</sup>

Today the "Platonic Mirrors" of an "implicate order" of the cosmos in which "all things are in all things, but appropriately" (Proclus *Elements of Theology* prop. 103)<sup>32</sup> informs the "Procline" Physics of David Bohm and others. For Hilary Armstrong the Plotinian image/archetype reflections on *all levels* symbolize the idea that the cosmos itself *is best characterized* as the resulting image of an "effortless contemplation"—an almost natural reflection, rather than the painstaking work of a "craftsman" from a "model"—Platonic dogmatism or "fundamentalism." But all of the images are shattered in the One.<sup>33</sup> And the One is the (only)

cause of Matter (*Hyle*). The "highest" and "lowest" are imageless. But only images (icons) point to them.

# **The Neoplatonic Background of the Metaphysics of Karl Jaspers and Its Impact on His Moral Philosophy**

**F.-P. Hager**

Karl Jaspers (1883-1969) is one of the most important existential philosophers of the 20th century and, as such, has emerged primarily as a systematic thinker. Although he is primarily an important systematic thinker, he shows an intensive interest in the history of philosophy and especially of European philosophy from the beginnings in Greek antiquity up to the present. In the lively philosophical disputes with the great philosophers of the European (but also the Indian and Chinese) history of ideas, he has developed as philosopher and has arrived at his own fundamental convictions. A persuasive testimony of these disputes is the planned monumental work "The Great Philosophers" of which the old Karl Jaspers (1957) published the first great volume (the other two comprehensive volumes contain only individual descriptions, fragments, remarks and an inventory and were published in 1981 by the intellectual administrator of the Master's estate, Hans Saner).

Platonism plays an important role throughout this monumental work of the history of philosophy of Jaspers, which is based and structured on decisive systematic fundamental thoughts. Two individual sections of the work, which Jaspers published himself, stand out especially: namely the one on Plato himself, who (together with St. Augustine and Kant) is presented as the pathbreaking founder of philosophising (p. 234ff.) and the one on Plotinus whom Jaspers lauds as "a metaphysician who thinks from the origin" (p. 656ff.). The interpretation of Plotinus, especially, shows clearly how and in which manner Jaspers adopted his Neoplatonic thinking, i.e., what was for him especially important in it. The reference to this true, original, Plotinus interpretation by Jaspers himself will enable us in the following to point out and establish

the Neoplatonic background of many of Jaspers' important fundamental philosophical convictions.

Basically we will proceed in a manner that will permit us to investigate the Neoplatonic affinities of Jaspers' thought within a circle of three different philosophical themes. First we will analyze the metaphysics, and more exactly the philosophical theology, of Karl Jaspers with special attention to how far Jaspers' conception of the approach of man to God, or the human cognition of God, is influenced and oriented Neoplatonically (1st part). Then we will attempt to show that also the existential-philosophical conception of man of Karl Jaspers with its very special understanding of the determination and recognition of the true self-being of man is unthinkable without reference to the Neoplatonic philosophy, i.e. to its cognitive-theoretical and ontological metaphysical assumptions (2nd part). Finally, according to Jaspers, certain moralistic impulses clearly arise from the existential-philosophical interpretation of man, i.e., a certain existential-philosophical moral philosophy or ethics can be structured on it. Also, these ethical implications of the existential philosophical conception of man and conception of God have their points of contact to Neoplatonic thought and we will also attempt to work out this connection (3rd part).

However, we are not concerned in this essay with pursuing in connection with Karl Jaspers' "Source research" and, compared to the philosophical-historical past, to lead his very original existential philosophical new attempts back to the Neoplatonic roots of it. Much rather, the similarity of the forms of thinking in Plotinus and Jaspers is to be illuminated while yet still retaining the differences between the two positions.

### **I. Relationship of Man to God and the Cognition of God in Metaphysics**

The existential philosophy, especially in the form represented by Karl Jaspers, has its name, characteristically, from the peculiar human sense of being, the "Existenz," about whose elucidation the existential philosophy of Karl Jaspers actually turns. Despite this central interest in man, the existential philosophy, in certain aspects, is also the resurrection of the antique thinking of being and, especially with Karl Jaspers, leads in his first philosophical main work the "Philosophy" (1932), from the "World Orientation" (first volume), via the "Existential

elucidation" (second volume) up to his "Metaphysics" (third volume) finally to nothing else than Jaspers' philosophically termed and reflected Deity, the "Transcendence," the absolute being which is presented in comparison with the being in the totality and in general. The "Metaphysics" then also contains an ascent of the being analysis from a particular being, from the finite and bounded being of the world, up to the eternal and absolute being of God, the Transcendence. This ascent is also thought of as evidence of the reality of the divine Transcendence, although Jaspers rejects the proofs of God's existence in their traditional form. The main section of the "Metaphysics," however, is dedicated to the relationship between man and God, i.e., to the answer of the question of how man, especially from the existential dimension of his being, achieves the inner (intellectual and emotional) approach to the Deity, to the absolute being of the Transcendence.

Very similarly now (and yet with some very important fundamental differences) there is formed in the framework of the Neoplatonic metaphysics of the Being and the One, the intellectual philosophical ascent to the perfect One and Good as the ultimate Deity and the highest principle of all. From the various levels of forms, Plotinus leads us to the perfect Ideas of the divine Intellect and by means of various levels of the oneness and being he leads us up to the perfect One and Good as the highest principle which is certainly elevated above any beingness and all being. Then, there arises immediately after these "Proofs of Deity," which for Plotinus are still pure, rational arguments for the existence of the highest principle and the divine Intellect, also the important question of how the absolutely perfect highest principle of all, the One Good, in its elevated state above every form and every being, can be recognized and comprehended by humans whose recognition is usually directed completely to objects (forms). This question is identical for Plotinus with all other questions (which also occupied Jaspers) which dealt with the meaning of the highest Deity for man in his search for his welfare (and for Jaspers for the realization of the true self-being).

In the following there will now be described, one after another, the ascent to the Deity, especially the relationship of man to God, and the cognition of God as they are characterized in the metaphysics by Jaspers and Plotinus before both positions, that of Plotinus and that of Jaspers, are compared with each other and a possible adoption of the Neoplatonic train of thought by Jaspers can be clarified.

### A. Metaphysics as Philosophical Theology and its Importance for Man in the View of Karl Jaspers

According to Jaspers, philosophy is the never ending question of what being is. Various methods of the search for being from possible "Existenz" are also, according to Jaspers, ways to the Transcendence, simply ways to the Deity. Thus, according to Jaspers, metaphysics is the philosophical elucidation of the path to Transcendence ("Philosophy" III, p. 3 and p. 4). Metaphysics, thus also as the culmination of existential philosophy, is philosophical theology. This attempt by Jaspers can only be understood unmistakably if one follows Jaspers' fundamental train of thought: man first comes up against a particular being in this world, which as defined being is knowable. The fundamental terminology of scientific cognition, the categories, show the basic modes of the definition of the particular beings. Being in the sense of "being known and thought" becomes objective in its ramifications and in its diversity. But the being does not exhaust itself simply in the known and thought. In the world orientation, which is, as it were, the lowest rung of the philosophical elucidation of being man takes hold of the empiric reality, which is not only known and thought, but also contains a something more, something covered by thought but not penetrated. Being as being known carries at the same time the unknown at its bounds. But even the known with the cognitively recognized unknown as the world being does not simply exhaust being ("Philosophy" III, p. 3).

From mundane being, transcending it, man, according to Jaspers, comes to himself as possible "Existenz." Thereby he achieves the next highest level of the philosophical search for being, the existential elucidation which follows to the lower degree of philosophy, the world orientation. Man, as "Existenz," in his being is a self structured being, fundamentally free but always together and in communication with other human self-beings, with other "Existenz." Man, to a certain extent, is a being in his "Existenz" which still decides whether and what it is, he cannot emerge from himself and see himself. But also this being of man himself, the "Existenz," is not simply the being with which all things would be exhaustible. The "Existenz" of the individual man is not only together with other free beings (that is, with and through the other human "Existenz"), but is itself related to a being which is not "Existenz" but Transcendence ("Philosophy" III, p. 4f.). Here there is clearly mentioned for the first time by Jaspers that man is not an absolutely complete and in himself autarchal unity

(he is not that especially because of "Existenz"), but refers above himself to a last, absolute being which is the final ground of all being.

However, Jaspers' existential philosophical search for being differs substantially from the classical metaphysical ascent to the Deity in Neoplatonism in that Jaspers starts his reflection with the conception of the disjointedness of the being, i.e., of an incoherence of the various levels and layers of the being: the being cannot be terminologically comprehended in the form of a hierarchy of being. The transitions from one level of being to another (from the world to the "Existenz" and from the "Existenz" to the Transcendence) are no longer rationally discoverable, but separated by a chasm which can only be bridged by an irrational jump. For this reason, the question of being as being cannot be properly understood from the viewpoint of the rational consciousness of man. To simply bring the disjointedness of the being to cognition is, according to Jaspers' treatment, an act of the freedom which can only arise from the true self-being of man, the "Existenz."

And yet, the search of man for being, which leads him ultimately to the absolute being of the Transcendence (as the Deity), has a certain inner necessity: possible "Existenz" as compared to the being of the empiric reality is characterized in that it really is in this search for the being. This search of the being finds no satisfaction in the finite being. Man finds the "floor of being," i.e., the ultimate ground of being, in none of the portions of the being, not in mere existence, not in the manifold certainties of particular being as cognition and recognition, not on the level of the "Existenz," not in his self-being as an isolated and not in the communication with other self-beings.

In view of the absolute being of the Transcendence (as the deity), it seems that the search for the being, even with Jaspers, eventually comes to rest. But this rest, or a certain satisfaction and fulfillment which is seen in view of the Transcendence, does not mean that the thinking of man can comprehend the Transcendence as a term or as knowledge content. The search for the Transcendence as the last ground does not cease in view of the Transcendence. The final reason, the ultimate source of a being constantly withdraws itself from the conceivableness of human understanding. Yet this abyss of the Divinity, a void for the intellect, can fill up for the "Existenz." The searching can be turned to finding in the temporal being of man when related to eternity, when man realizes that the search for the absolute being is not cut off from that which it is seeking, because only from the anticipation of what is to be found can a search be made; Transcendence must already

be present where man seeks it. In transcending, i.e., in the inner ascent to the Transcendence, man knows of being neither in the form of objective knowledge such as world orientation, nor as he knows of his inner self as himself in the existential elucidation, but rather he knows of the absolute being in an inner doing that even in failure remains with the actual being of the Transcendence. The actual being of the Transcendence, without being found as objective support, can give to the "Existenz" the strength to uplift itself in existence ("Dasein") and to rise to itself and to Transcendence in one ("Philosophy" III, p. 5). With this, according to Jaspers, a first and important indication is given of the necessary being of the Transcendence and of the meaning of the Transcendence as the last possible recourse, as the last possible reference point for man. At the same time, Jaspers never tires to point out that this being of the Transcendence cannot be recognized and proven scientifically and cannot be rationally demonstrated. Much more, he points to the unavoidable relationship of the human "Existenz" as freedom with the divine Transcendence as absolute being from the discontent of man as "Existenz" with all being that is not Transcendence ("Philosophy" III, p. 5-7).

After the being and the reality of the Transcendence has been pointed out, Jaspers' whole efforts really focus on describing the various methods of approach of man to the Absolute. The philosophical metaphysics for Jaspers is nothing else than the elucidation of the path to Transcendence ("Philosophy" III, p. 5).

Fundamentally, Jaspers knows of three important relationships of man to the Transcendence as the absolute Divine, namely: first, the formal transcending, secondly, the existential relationship to the Transcendence and thirdly, the reading of the ciphers. Jaspers provides an extensive explanation of all these three characteristic aspects of the relations of man to the Transcendence ("Philosophy" III, p. 34ff., p. 61ff. and p. 113ff.). We can only touch briefly here on these three fundamental relationships of man to the Transcendence and on how they are described in the metaphysics of Jaspers.

In order to understand what Jaspers means with the formal transcending as the first approach or path to the Absolute, and what is the deeper meaning of all three methods of approach to the Absolute, one must comprehend what, for Jaspers, transcending is all about: Transcending in philosophy is the overstepping of the objectivity. Philosophy is the thinking ascertainment of the true being itself. Because no being, which could be taken as a researchable object, is possible as the true

being itself, philosophy must transcend above all objectivity ("Philosophy" I, p. 76ff.). Transcending occurs in the world orientation, the existential elucidation and the metaphysics ("Philosophy" I, p. 83ff.). But also the methods of dealing with the approach to the Transcendence treated in the "Metaphysics," which I mentioned previously, are each a transcending, an overstepping of objectivity ("Philosophy" III, p. 37f.). Now the formal transcending as the first method of approach of man to the Absolute and to the Transcendence, limits itself to the purely conceivable and the area of thought. Beyond the beings defined in the categories as the fundamental forms of thought and scientific cognition, the thought transcends from the defined to the undefined. Thinking, with its links to categories, would always like to better connect Transcendence to a particular object and thus make it comprehensible to thought, but, if it remains consistent, one is always led to the recognition that the absolute being of the Transcendence cannot be grasped by means of particular terminology, that all categories of thought must still be negated from the Absolute or the Transcendence. The intellectual execution of this train of thought is just formal transcending. Whereas the thought of the categories would like to see all being to be exhausted with the categorical determination and whereas the rendering absolute of individual or all categories would lead to a definition of the Transcendence—i.e., to an ontology—the way to Transcendence is kept open in the formal transcending. The experience of a formal transcending is an original philosophical experience. It is still empty, but in thought as such it is present. In it, the thought and the metaphysical ascertainment come together ("Philosophy" III, p. 38-60).

Another form of approach to Transcendence can now be found by man in the existential relationship to Transcendence (even though we are dealing here again with a transcending). The being of the "Existenz," which in itself is insufficient, feels itself in its self-being in one with the Transcendence. Transcendence is very important for the existential self-realization of man, and for this reason also, one makes use of metaphysical terminology in the existential elucidation, in order to develop possibilities of "Existenz." Metaphysics makes the existential relationships of man to Transcendence such as Defiance and Surrender, Rise and Fall, the Diurnal Law and Nocturnal Passion, the Wealth of Diversity and the One, an explicit theme. Not Transcendence itself, but how it supports possible "Existenz" in its self-being is thought of in the metaphysics when the second method of approach to Transcendence is elucidated ("Philosophy" III, p. 61-112).

Beyond the empirical reality contained in the world orientation and beyond the freedom appealed to in the existential elucidation, the thought transcends in that it follows the reading of all being as a cipher script of the Transcendence, as far as it could be deciphered for the "Existenz." Ciphers for Jaspers are virtually symbolic characters with which man can come to understand the total appearing reality, the empirically ascertainable world of the being ("Dasein") and the region of the existential self-being as a manifestation of the Transcendence. Man can arrive at the reality of the Transcendence from the regions of nature, history, the theoretical consciousness in general, the actual being of man in existential freedom and via the medium of art in the reading of the ciphers. Nature, history, consciousness, "Existenz," freedom and art are regions of ciphers and ciphers themselves. The reading of the cipher language is either the thinking cognition of reality as it is perfected in art and poetry (because they also explain reality as manifestation of the Transcendence), or it is the creation of a philosophical language which, on its side, attempts to decipher in thought the Being as cipher. The philosophical metaphysics, which in its conceptions of the reality ("Weltanschauungen") does not mean them literally but therein states the Transcendence (i.e., by means of its "Weltbilder" interprets the Transcendence symbolically) finds its place here ("Philosophy" III, p. 113-208).

Jaspers' whole expositions in his "Metaphysics" ("Philosophy" III) of the being of the Transcendence, the Deity and of the approach of man to it, already show internally several paths which point to an inner relationship to the Neoplatonism of Plotinus. This is particularly clear at certain points, e.g., where Jaspers (within the framework of the existential relationship to the Transcendence) comes to speak of the seclusion of the Deity ("Philosophy" III, p. 70ff.), and more there where he comes to speak of the "Wealth of Diversity and the One" and therein of the "Transcendence of the One Deity" ("Philosophy" III, p. 84-94, esp. 92ff.). However, Jaspers mentions elsewhere again, that his metaphysics, which does not aspire to be an enclosing ontology, differs fundamentally from the ontology of Plotinus (and Hegel), but the philosophy of Plotinus, according to Jaspers, is also an appeal to possible "Existenz" and form of a cipher script ("Philosophy" III, p. 138ff., esp. 139).

It is now immediately necessary to delve into the method of how Plotinus proves the One-Good as the highest principle and how he goes about the approach to the One-Good and the cognition of the

One-Good as the highest Deity through man, before we compare the two positions, that of Plotinus and that of Jaspers, with each other and before we can clarify a possible Plotinus-adaption by Jaspers as regards to his metaphysics of the Transcendence.

#### B. Plotinus' Philosophical Theology: The Proof of the Existence of the One-Good As The Highest Principle and the Cognition of the One-Good

The core and centre of the philosophy of Plotinus and especially his philosophical theology or metaphysics is his teaching of the three hypostases, of One-Good, divine Intellect and World Soul, as he describes it in the writing of the same name (V, 1). What interests us most, naturally, is Plotinus' teaching of the One-Good as the highest principle of all because a comparison with Jaspers is best possible here. Jaspers recognizes no hierarchy of the divine entities as does Plotinus. In any case, a marginal comparison of the divine Intellect which thinks of the cosmos of Ideas as itself, should be included because, according to Plotinus, the divine Intellect is the most immediate and highest manifestation of the One-Good and the second highest cause of all and the analysis of its being and existence permits us to come to conclusions on the existence and nature of the One-Good as the highest principle.

Of very particular interest in the present context, however, is the rational, intellectually proven and argumentative character of Plotinus' metaphysics and especially his teachings of the perfect One and Good as the highest principle of all and the ultimate Deity. Although Plotinus is of the view that man finally and ultimately will comprehend the perfect One and Good as the highest principle only through mystical union with it, his philosophy is nevertheless no oriental irrationalism for his teaching of the perfect One and Good as the highest principle as well as also his teaching of the divine Intellect as the metaphysical cause of the second rank is rational in every aspect, i.e., based on reasonable, understandable and reconstructable arguments as is shown especially in my book "Der Geist und das Eine" (esp. p. 255ff., see also p. 237ff. for the perfect One and Good and p. 217ff. for the divine Intellect).

I only emphasize the most important aspects here as I will next show how Plotinus proceeds fundamentally in the proof of the existence of the One-Good as the highest principle and which philosophical methods he then brings to bear on the explanation of the nature of the One-Good as the highest principle of all.

In his treatise "Of the One-Good" ("Enneads" VI, 9) Plotinus presents one of his most famous methods of proof for the existence of the highest principle (namely in VI, 9: 1-2) before he then presents extensive explanations of the (just as rational) determinations of the nature of the highest principle (VI, 9: 3-6) and finally even works out instructions for the mystical view of the One (VI, 9: 7ff.).

In his arguments in favour of the existence of the One-Good as the highest principle (VI, 9: 1-2), Plotinus starts from the basis that "All being is, by virtue of the one, a being, as well as what an original and an actual being is as that, which is designated as being only in an arbitrary sense. Because what could it be if it is not one. If, indeed, one were to take its declared oneness away from it again, it is no longer what one calls it" (VI, 9: 1, 1-4). Thus, the oneness of each being constitutes its being and its reality, and that this is so is now shown by Plotinus on the basis of a whole hierarchy of beings. The higher a being is, the more one and simpler it is and the higher is also the level of its being and its structure (essence). Plotinus thus guides us through a whole hierarchy of beings from the groups and aggregates in the area of the observable (army, herd, dancing group), through the artificially constructed objects, the artefacts (e.g. houses), the continuous magnitudes, the organisms to the intelligible world and, in this, from the human soul to the World Soul. And from this to Intellect, Ideas and Being, united in a divine Intellect and from this again to the One-Good which, in its absolute Simplicity and Goodness, is elevated even above Intellect, Ideas and Being. Therefore, the One-Good is the highest principle of all because oneness at all levels of being is the cause of being and the constitution of being and because the perfectly simple being, the One-Good, is also in the best position to cause all else in its oneness and in its being (VI, 9: 1-2).

The whole hierarchy of all beings, which differ among themselves on the various levels of the hierarchy of being by means of larger or smaller oneness, beingness, structure (essence) and fullness of reality is finally metaphysically caused by the perfect One and Good as the highest principle. We are actually dealing here with a hierarchy of levels of being which can easily be compared with Jaspers' areas of being, but which also, as we shall see more exactly later, has important differences to Jaspers' metaphysics of being. One of the most important differences, which we can mention in advance here, is naturally that, with Plotinus, one cannot speak in any manner of the disjointedness of the being, rather, the various hierarchical levels of being are connected

with each other by means of a strict, continuous, order. A further difference is of rather lesser importance, namely that with Plotinus, the highest principle of all, the highest Deity is not permitted to be designated as being, not even as the ultimate being but it is elevated above all being and not a being, also not a perfect being any longer, but just a perfect One and Good. And yet, naturally, the philosophical theology of Plotinus can be ranked as metaphysics of being, which is what has actually happened in the literature.

But if in this manner the perfect One and Good as the highest principle of all and as actually the highest, supreme, being (although being above being) is proven by Plotinus (for further arguments see also F.-P. Hager: "Der Geist und das Eine," p. 237ff., esp. p. 244ff., p. 271ff., p. 294ff.), then a further question arises: How can Plotinus' perfect One and Good be recognized as the highest principle of all, i.e., how is one to imagine the approach of man to Plotinus' supreme Deity?

The way in which man knows of the One-Good as highest principle is derived by Plotinus, with logical necessity from the term of the One-Good. The One-Good as highest principle is perfectly simple and elevated above all plurality (above all which possesses a multiple structure and form); thus, it can be identical neither with the perfect divine Intellect nor with the World Soul as, although they are united in a divine manner, both are nevertheless plural presences. The perfect One is neither Being, nor Idea, nor Intellect, it is above Being and above Intellect. It can be described and comprehended by none of the Aristotelian categories (e.g., substance, space, time, quantity, quality) and by none of the Platonic categories such as movement, quiet, identity, difference (according to Plotinus, the Aristotelian categories include the visible world and the Platonic categories the intelligible or spiritual world; see VI, 1-2). In a word, the One-Good can only be comprehended in what was later called the negative theology, it can only be comprehended in that one determines everything that it is not: only if all finite and bounded being and its being and all being terms is negated of the perfect One and Good, only then does one arrive at a more or less adequate comprehension of the One-Good as the highest principle of all (for this, see especially VI, 9: 3-6).

However, for Plotinus, the negative theology as regards the One-Good as the highest principle of all is not absolutely valid. Although it is correct that, according to Plotinus, there can be no cognition of the One-Good as the supreme Deity because all cognition, according

to Platonic teaching, always refers to being and being has a pluralistic structure. The actual, true cognition refers to the true being of the Ideas (and not as the mere opinion (δόξα) of the sensory perception to the corporeal world). But even the true being of the Ideas, which Plotinus identifies with the divine Intellect, is a plurality, if also the highest (an intelligible cosmos as Plotinus says with Philo of Alexandria), and thus differentiated from the One-Good which is perfectly simple. Thus, if cognition is always directed towards being and plural being, then the One-Good cannot be part of this cognition and cannot be comprehended as it is perfectly simple.

If, however, there can be no cognition of the One-Good, then all the negations which arise in connection with the One-Good can have no absolute validity as they also claim to be comprehensions. The negations, which the negative theology declares and affirms of the One-Good must be negated again for the sake of the perfect simplicity of the One-Good, which means nothing else than that at least, and above all, the characteristics of the nature of the divine Intellect as the supreme manifestation of the One-Good in the metaphorical sense and in a symbolic manner must again be assigned to the One and Good and may be attributed to him.

In fact, in various places, but especially in two famous ones, there are attributed to Plotinus' One-Good again (although in the manner of perfect simplicity) various characteristics which remind one of the characteristics of the divine Intellect. In the one place (V, 4: 2, 12-26), there are attributed to the One-Good as the origin of the divine Intellect the designation "Intelligible" (νοητόν) and, in connection with it, a certain self-consciousness (ὅλον συναίσθησις). In the metaphorical sense, and at the same time, there is connected to it the assumption that the One-Good in an absolutely original and simple manner already contains everything in it and can thus be the cause of all which comes later and, above all, of the divine Intellect, which also contains an ideal totality of archetypes, an intelligible cosmos in itself. Plotinus says it in the following words:

The Intelligible (νοητόν), in which it remains by itself and is not definite as is the seeing and thinking...is nevertheless at the same time not, as it were, unconscious (οὐκ ἔστιν ὅλον ἀναισθητόν), for all that is being, is in it and with it, it is completely able to discern itself (διακριτικὸν ἑαυτοῦ), there is life in it and all things are in it (πάντα ἐν αὐτῷ), it is itself his own self-thinking, in that it is able, to a certain extent, to remain by a type of self-consciousness

in eternal rest and thinking (καὶ ἡ κατανόησις αὐτοῦ αὐτὸ οἶονεῖ συναισθῆσαι οὐσα ἐν στάσει αἰδιῷ καὶ νοήσει), other than it is the case of the thinking of the Intellect. (V, 4: 2, 12-19).

Basically, the same attribution of a supra-intellectual original thought of the One-Good with simultaneous differentiation between the One-Good as the highest principle and the divine Intellect is now also carried out by Plotinus in the chronologically (in comparison to V, 4 = No. 7) later writing, namely in VI, 8 (No. 39) which has as its theme the freedom of the will and the free self-creation of the One-Good. Also in this second writing (VI, 8), the One-Good can be depicted again in the metaphorical sense as not soulless and senseless life (VI, 8: 15, 30-33), it can be called "Virtual Intellect" (ὅλον νοῦς) in that it virtually loves itself (VI, 8: 16, 14-18). Further, it can be determined that the One-Good possesses its supreme actuality in that it, as it were, contemplates itself, and in this self-contemplation also creates itself (VI, 8: 16, 19-21). Further, in a symbolical manner, one can attribute an eternal energy to the One-Good, which is a type of ever-present awakening (ἐγρήγορις) and a thinking above thought (ὑπερνόησις) (VI, 8: 16, 30-40) with which Plotinus, leads to Aristotle. And in a last passage containing evidence of the writing VI, 8 which should be mentioned here, Plotinus can even say that the divine Intellect and the truly Being (the Ideas) which exude from the One-Good (or which have poured out of him as Plotinus also formulates it in the framework of the emanation teaching) bear witness, on the basis of their Intellectuality, of the virtual Intellect in the One which is not Intellect but one (VI, 8: 18, 18-22).

Important for us in this positive determination of the nature of the perfect One and Good as the highest principle is this, that here, besides for the negative theology and parallel to it, but not in contradiction to it, there appears still a different form of approach to the highest principle which has already demonstrated its importance within the framework of the intellectual discussion of the One-Good or the supreme Deity, namely, a type of symbolic theology (this too is a term, that, like that of the negative theology, has arisen in connection with the later Neoplatonism). Here, now, the central terms, which are to serve for the designation of the One-Good as the highest principle, are no longer negated by the One-Good but are used, if only in the metaphorical sense, directly for the supreme Deity. This is valid, primarily for all characteristics which bring the perfection, or one of the aspects of

perfection, of the divine Intellect to expression. But also, it is valid (and this is interesting for the comparison with Jaspers) for the total reality which has been derived from the One-Good as the highest principle. The One-Good which has simply produced the whole (τὸ πᾶντα) of the derived reality of all beings, has at its disposal in itself a supremely simple prototype of an intelligible cosmos, which means, that in reverse, everything remaining describes a form of allegory, mirror and representation of the supreme Deity and the highest principle (as for Jaspers everything in the reality of the phenomena can be a cipher of the Transcendence).

A further important approach of man to the supreme Deity as the highest principle, besides the negative and besides the symbolic theology, is very essential especially for the comparison with Jaspers. While each metaphysical-theological discussion, whether as a negative or positive symbolizing theology, proceeds intellectually and must be in a position to exactly intellectually justify the method of its procedure, the mystical unity (unio mystica), through which alone (if also only in seldom occurring moments of elevation) man attempts to achieve the perfect adequate comprehension of the One-Good is a super-rational, super-intellectual process which grows from a particular, practical ethical, ascetic and cathartic style of life and cannot be rationally planned. In the discussion VI, 9 "Of the One-Good" from which we started, Plotinus provides, after the theoretical part which includes the proof of the existence of the One-Good (VI, 9: 1-2) and the explanation of its nature (VI, 9: 3-6), detailed descriptions which allow us to recognize that he speaks from a long experience of philosophical lifestyle as well as mystical contemplation and concentration (VI, 9: 7ff.). Here, if anywhere in the Plotinus writings, one realizes that Jaspers is correct when he speaks of the existential seriousness of Plotinus ("The Great Philosophers," first volume, p. 656ff., esp. pp. 666 and 671ff.).

Thus, it seems to me that for our purposes, the important facts have been discussed on the philosophical theology and metaphysics of Plotinus, of his proof of the existence of the One-Good, of his explanations of the nature of the supreme Deity and of his view of the approach of man to God and we can pass on to a comparison of Jaspers with Plotinus.

### C. Existential Philosophical and Neoplatonic Thinking in the Comparison and the Adoption of Plotinus by Jaspers

If we now turn to the question of how far the existential philosophy of Karl Jaspers, especially in its metaphysics was inspired or even

influenced by Neoplatonic thinking, then no source historical point of view comes to the fore, that is, we do not want to know exactly in which details, historically and factually, Karl Jaspers is dependent on certain formulations of Plotinus. Of rather greater interest to us is the question of important agreements between the metaphysics of Jaspers and the philosophical theology of Plotinus; also then, if this agreement cannot be traced back from the start to direct historical influence on the one thinker (Jaspers) by the other (Plotinus). For this reason, in this chapter, we will next compare the two thinkers and their metaphysical or philosophical theology, we will define similarities but also differences and only then will we attempt to answer the question of *Plotinus' adoption by Jaspers*, i.e., in his own philosophy.

In fact, certain *similarities and points of agreement* between Jaspers' metaphysics and the philosophical theology of Plotinus are very apparent. Both thinkers start from the point of view that man is intrinsically occupied with metaphysics and, in the philosophical sense, with theological questions, and that the answers which he finds to these questions are of the highest existential relevance to him. Both hold that the posing of the being question is the central concern of philosophy and both are of the point of view that the original metaphysical questioning of the being as such will lead man with a form of inner necessity finally to posing the question of the ultimate reason of all being, to the unconditioned and absolute being.

Both are also of the point of view that one can philosophically demonstrate the reality of the Transcendence, the Divine, as the ultimate ground of all being, in that, through analysis and interpretation of various levels and regions of the being, one arrives finally with inner intellectual necessity at the absolute ultimate perfect final ground of all being.

Nevertheless, here the first important *differences* between Plotinus and Jaspers already appear: Plotinus assumes a whole hierarchy of the beings and of the levels of being which according to the grade of their being as well as their oneness and their goodness are dependent on each other and finally and ultimately on the One-Good as the highest principle and highest ground of all being. Jaspers, on the other hand, he differentiates between various "levels of reality" and regions of the being, does not divide them into a hierarchical order of rank by which they are linked to each other cosmically and organically but strictly separates them from each other so that one can move from one to the other only by means of a jump. There reigns here for Jaspers

what he calls the disjointedness of the being (a type of disorder, which would be unthinkable for Plotinus).

The result of this is that Plotinus believes, arguing from the different levels of reality which represent, for him, the grades of the being, the structure, the oneness and the goodness, that he can refer back to the One-Good as the ultimate source and the highest principle of all being, all oneness, goodness and form. Plotinus has certainly assumed in his own version something in the form of a proof of the existence of God with his arguments for the being and the efficacy of the divine Intellect and the perfect One-Good. In comparison to this, Jaspers polemicizes for various reasons against the significance and necessity of the proof of God if one takes this literally as that which it wishes to be, namely a scientific proof for the being of the Deity and not rather as a cipher ("Philosophy" III, p. 175ff.). For Jaspers there is only a super-intellectual, irrational (in any case no longer scientific), "existential" inner necessity of the ascent of man to the Divine. From the discontent of all that is bounded, limited being, from the discontent, in fact, of all being which is not transcendent, man arrives at the ultimate ground of the being, the Transcendence ("Philosophy" III, p. 5ff.).

But although Plotinus deals with the question of God within the framework of the traditional rational metaphysics and ontology founded by Plato, but Jaspers within the framework of an existential philosophy which is much more irrational and has passed through the Kantian criticism of knowledge, nevertheless some important aspects of the cognition of the Divine and of the approach of man to the Transcendence can be compared in both thinkers. Thus it is easily possible to compare the negative theology of Plotinus with the Jaspersian process of transcending when comprehending the Deity and thus, what Jaspers designates as the reading of the ciphers when ascending to the Transcendence, can be easily compared with certain aspects of the symbolic (allegorically affirmative) theology of Plotinus. Also here, naturally, it is valid to note the differences between Plotinus and Jaspers (as was done in the evidence of the being of the Divine).

When we compare Jaspers' method of transcending when ascending to the Divine with the negative theology of Plotinus, and Jaspers' reading of the cipher language with the symbolic theology of Plotinus, we must be aware that both theological methods in the philosophy of Plotinus are developed within the framework of the rational metaphysics and ontology and in all cases must be viewed as intellectually provable processes. All direct statements on the One-Good and each direct

attribution of particular characteristics to the One-Good according to Plotinus is impermissible because the One-Good is perfectly simple and thus elevated far above each pluralistic structure of being, which is the actual object of the statement, cognition and attribution. For this reason, the One-Good can only be comprehended by means of negative theology. And for the same reason, all expressions of excellence of the divine Intellect, all characteristics which express its perfection can only be applied and referred to the One-Good as the highest principle of all (and the origin of the divine Intellect) in the metaphorical sense.

With Jaspers, on the contrary, the rational metaphysics and ontology are discarded because, Jaspers adopted certain of the fundamental insights of the Kantian theory of knowledge and the latter's critique of the rational theology and metaphysics, and because, according to Jaspers, an actual science is only possible supported by human experience in the region of the appearances. For this reason it has a somewhat different, wider meaning when Jaspers, with reference to the comprehension of the Transcendence and the Divine requires the method of transcending (also formal transcending), and on the other hand insists, that one approaches the Transcendence or the Divine which one attempts to comprehend positively through the reading of the ciphers, i.e., only in an allegorical symbolic method. The Divine, simply the Transcendence, according to Jaspers, can no longer be comprehended by means of a rational theology and ontology and therefore, according to Jaspers, everything that is bounded and limited, all science and rational cognition must be transcended if one wishes to comprehend the Divine which for Jaspers is simply the Transcendence. For this reason also, one can only approach the comprehension of the Divine in an allegorical symbolic manner, by reading the ciphers, whereby one must assume that the visible, objective, comprehensible reality is in total a form of allegory of the Divine.

Not wholly without importance for a comparison of Jaspers' metaphysics of the Transcendence with the philosophical theology of Plotinus is that for both the Oneness and Uniqueness of God as the highest principle (as opposed to the plurality of the appearances and all individual reality) plays a large role. Not only in Plotinus is the perfect One as the perfect Good (or as the perfectly simple Absolute) the highest principle of all (see also VI, 9: 1-2), but also for Jaspers one can talk of the "Transcendence of the One Deity" and thus of the Transcendence as the one Deity and as the perfectly simple Unity of the perfect One ("Philosophy" III, p. 110ff.). However, here, too, one must point

out the differences, that in Plotinus with the One-Good, the highest principle is meant the first Deity of a hierarchy of three original divine Hypostases (that the One-Good is placed at the top of a Trinity to which the divine Intellect and the divine World Soul also belong), while with Jaspers there is only one single Deity (here Jaspers is to be compared rather with the Christian and Jewish monotheism than with the henotheism of the philosophical theology of Plato and of Neoplatonism). However, it seems to me that this (undeniable) difference is not very important when one considers that also for Jaspers the Deity is repeatedly referred to as *the One* which wants truth especially when man approaches it in a truly existential reference (see also op. cit., esp. p. 111f.).

This, however, brings us to a final, and for us, important aspect of the comparison between Jaspers and Plotinus in the philosophical theology and the question of the Deity. Jaspers emphasizes in various places that the experience of the divine Transcendence has true substance only for possible "Existenz," while the cipher of the divine Transcendence must remain empty for the merely logical thought. This is why, for Jaspers, the existential relations to the Transcendence are so important ("Philosophy" III, p. 61ff.). Doubtless, this teaching of the existential relations of man to the Transcendence is something which can only exist on the foundation of Jaspers' existential philosophy. This concept of the existential relationship to the Transcendence thus presents an original and genuine philosophical effort on Jaspers' part. Yet, Jaspers himself never shrank back from ascribing to certain philosophies and thoughts of earlier times an existential, or at least existentially-relevant philosophy. He mentions this especially with respect to Plotinus, calling him a metaphysician who thought from the origin ("The Great Philosophers," first volume, p. 656ff.). Indeed, although with Plotinus one cannot find existential relationships to the Transcendence in the narrow sense of the existential philosophy, one can certainly find it in the wider philosophical metaphysical sense to the One-Good as the highest principle and to the supreme Deity. Especially, for example, the *directions for the mystical view of the One or to the mystical union with the One-Good* as the highest principle as Plotinus gives them in the writing VI, 9 (Chap. 7ff.) after the theoretical part on the existence and nature of the One show that the ascent to the One-Good as the source of all is no occasion of dry abstract thinking but the guiding principle of man as a whole whereby also practical aspects must be included.

After this comprehensive comparison between the positions of Jaspers and Plotinus in the question of God, we should finally direct our efforts, to clarify, or at least, discuss the question of whether, in the case of the metaphysics and the philosophical theology of Jaspers, one can talk of an *adoption* of Plotinus by Jaspers which could have deeply characterized Jaspers' own systematic philosophising.

First we can take for granted that, especially in the presentation of the great metaphysician Plotinus in "The Great Philosophers" (a.a.O.), Jaspers brings to bear terminology and forms of thought as well as thought processes which then return in the systematic philosophy of Jaspers himself. Especially the term of the transcending, the thinking reaching out beyond a certain threshold or level of reality or beyond any finite being or particular being, plays a great role in the presentation of the metaphysics of Plotinus ("The Great Philosophers" I, p. 667ff., p. 678ff.) and one can clearly perceive from the various types and meanings, how and in which the term is used by Jaspers in the philosophical historical presentation, that important aspects of the meaning which Jaspers attributes to this term in his systematic philosophy (especially in the metaphysics) have a Platonic origin (whereby, with Jaspers, one must always take the influence of Kant into account). Furthermore, the thought often returns that certain terms of Plotinus (mostly those that concern the Divine, especially the highest principle) are used in the metaphorical or purely in the symbolical sense. Indeed, the external, the form of the system as a whole, is according to Jaspers for Plotinus only an allegory for the intellectual contents, which Plotinus basically means ("The Great Philosophers" I, p. 666, p. 692ff.).

Next, the actual core of Karl Jaspers' philosophising appears there where Jaspers in his presentation of the metaphysics of Plotinus points to existential moments in the Neoplatonic philosophising itself ("The Great Philosophers" I, p. 666, esp. p. 694ff.). The soaring of the soul to Transcendence on the basis of man's freedom, which finds fulfillment not through the strength of the will but only through the gift and mercy of the Almighty, this is a philosophical conception in the midst of the existential philosophy of Jaspers and what it declares of the existential relationship of man to the Transcendence ("Philosophy" III, p. 74ff.). And exactly this conception, according to the presentation by Jaspers, can be found emphasized throughout the philosophical metaphysics of Plotinus ("The Great Philosophers" I, p. 694ff.).

Finally, it is reiterated: Plotinus' philosophising is not evaluated with a view to individual thought contents or dogmas by Karl Jaspers

for his existential philosophy and adopted in this sense; but in a sense of the living intellectual exchange, Jaspers apparently allowed himself to be animated by certain forms of thought and thought processes as well as by the intellectual fundamental attitudes of Plotinus. And this is apparently possible because a certain intellectual relationship nevertheless exists despite the centuries which have passed between Plotinus and Jaspers and despite the changed intellectual situation caused by social and scientific "progress".

## **II. Jaspers' Existential Core of Human Being, Plotinus' Innermost Essence of Man and the Recognition of Both as a Problem**

It is really self-evident that, for a particular thinker, his fundamental assumptions and his important philosophical convictions in the regions of metaphysics and the philosophical theology would stand in connection with his philosophical teachings in the region of the philosophical anthropology and ethics. Indeed, it is also easily possible, and in certain cases perhaps necessary, that the metaphysics and theology of a thinker has a decisive effect on his ethics and philosophical anthropology. With Karl Jaspers this is evidently so as regards the relationship between philosophical theology and philosophical anthropology. And also his ethical and moral-philosophical convictions, which he did not develop at all independently from his conception of man and his philosophical anthropology, are closely associated with the fundamental assumptions and the fundamental facts of his philosophical theology, i.e., his metaphysics. With Plotinus too, there is a close inner association of the teachings in philosophical theology and metaphysics, philosophical anthropology and psychology as well as in ethics and moral philosophy. And yet, one can say that for both of the great philosophers the metaphysics and philosophical theology does not have the same effect on their philosophical anthropology and ethics or that in both, theology, anthropology and ethics do not have the same inner association.

Especially important for our philosophical-historical investigation, which is concerned not only with the comparison of the pertinent theories of both thinkers but is also concerned with the question of Plotinus' adoption by Jaspers, is the following: very obviously, as we have shown in the 1st chapter, the metaphysics as philosophical theology of Jaspers provides important agreements and many points of contact

with the metaphysics and philosophical theology of Plotinus. This Neoplatonic influence in the metaphysics and philosophical theology of Jaspers also affects the philosophical anthropology and the ethics of our philosopher in a definite manner, because his metaphysics and conception of man have an inner association, indeed because the determinations of his metaphysics are of importance for the innermost core and for the "nature" of man. As compared to this, the Neoplatonic conception of man and the Neoplatonic ethics must be judged of lesser importance for the philosophical anthropology and for the moral philosophy of Jaspers which is the reason why, in the 2nd and 3rd chapter, we can keep our treatment substantially shorter than in the 1st chapter.

### **A. The Existential Core of Man and the Approach to the Self-Being With Jaspers**

The true self-being of man, the "Existenz," i.e., what is called in traditional philosophic language the inner structure of man or the core of man, is comprehended and presented by Jaspers in a completely unique way, namely, in that it is differentiated in a radical manner from the being of the world and from the being of the natural presence of man in the world ("Dasein"). Jaspers calls the world the contents of all that is approachable by man through orientation of the cognition as a necessary knowledge that is compelling for every man. In view of the being of the world, Jaspers immediately asks himself the question whether all being is exhausted with the mundane being and he answers this question, immediately thereafter, that what is called soul and God in mythical expression and is known, on the other hand, in existential philosophical language as "Existenz" and Transcendence, is not the world and cannot be designated as mundane being. Being ("Dasein"), for Jaspers, is a factual presence in the world and, when referred to man, is his life as that of a higher living being in the biological world, who strives with other living beings for his survival and who is interested in the world as the material and the basis of his life. "Existenz," however, is neither world nor existence ("Dasein"). "Existenz," therefore, cannot be simply factually known. "Existenz" is also not factually available and given. It is not (in the sense of being "Dasein") but is that what can be and should be. In the phenomenality of existence ("Dasein") and in time, it decides whether it is in eternity ("Philosophy" II, p. 3).

In order to describe more clearly that which Jaspers means as the "Existenz," it will now be shown how Jaspers advances his philosophizing

to the content of the "essence" of the "Existenz" and then there will also be explained the methods which he uses in the "Existential Elucidation," under which he understands the comprehension of the "Existenz."

In his great main philosophical work, the three-volume "Philosophy," Jaspers, in the first, introductory chapter of the second volume first points to the being of the "Existenz" before, in a second chapter, he separates the true I myself from the other aspects of man's being and in a third and fourth chapter brings it into a connection with communication and historicity (II, p. 3ff., 25ff., 47ff., 104ff.).

It is especially noticeable that Jaspers, before he presents explicitly what the true self-being of the "Existenz," is, or rather more, is not (2nd chapter, p. 25ff.), must point out again that, in fact, the true self-being the "Existenz" (of man) is or (as we would say) exists. Thus, as one doubts the existence of God, so one can doubt the self-being of man and, as Jaspers in an analogy to that, what earlier had to serve as the proof of the Deity, led to the evidence of the being of the Transcendence, so now he also raises speculations which are suggestive of the being (or as we would say: the existence) of the human self-being. However, similarly to the question of God, in the proof of the being of the Transcendence, there can no longer be rational proofs or scientific reasons which, according to Jaspers, compellingly prove the being of the "Existenz." Far more it is the final discontent of the human being in the world, which leads it more sensitively and unsuspecting to the being of the "Existenz" (comp. with the 1st chapter, p. 6ff. on the "Possible 'Existenz,' Unsatisfied in Existence = Dasein").

Now in the second chapter, Jaspers depicts how the true I Myself, the "Existenz," after the I has awakened from the natural unconcerned state, separates itself from all the remaining aspects of the human being one after the other, from being as consciousness, being as mere existence ("Dasein") and characteristic being (being as "character"). In this sense, Jaspers indicates that the true self-being, the "Existenz," is not the general consciousness of man (the I at large, that as "I think" makes possible and is the foundation of all human cognition and all human acts of consciousness), but also is not identical with the various aspects of being as existence ("Dasein") (Jaspers counts out such aspects of being: the I as a spatially present body = physical I, the I as rating in social life = social I, the I as I of achievement or active I, the I as the past; all these are I-aspects of the I-being [Daseins-Ich] and not to be identified with the I-myself). Finally however, Jaspers also emphasizes that the true I-myself does not exhaust itself in the

I as a characterized being, as an understandable typed character. I is all that, namely I as consciousness, existence and character but in being all that it is not aware of itself as a whole, beyond this it is still in the freedom of its existential self-formation ("Philosophy" II, p. 26ff.).

Similarly to the second volume of his "Philosophy," Jaspers later, in his work "Of the Truth" ("Philosophical Logic," first volume), differentiated the "Existenz" as "Base and bond of the modes of the all-embracing" not only from the world and Transcendence but also from the immanent modes of the all-embracing in man himself, namely from the existence ("Dasein"), consciousness ("Bewusstsein") and spirit ("Geist"). Existence and consciousness particularly are characterized as in the "Philosophy," "spirit" is the source of the ideas in man which permits him to realize ideal targets in communal social associations ("Of the Truth," p. 76ff.).

I however, after our depiction of the transcendence of the true self-being of man compared to all mundane being and all immanent aspects of man's being in Jaspers has been explained, Jaspers' reflections of the methods of the existential elucidation are very informative ("Philosophy" II, p. 10-18). Jaspers differentiates three such processes, namely: first, a "Leading to Limits," second, the "Objectivation in the Psychological Logical and Metaphysical Language" as well as third, the "Devising a Specific Generality for Existential Elucidation" (p. 11f., 12ff., 15ff.).

We have become acquainted with the first-named method, the "Leading to the Limits" when we presented how Jaspers comprehends the human "Existenz" in that he elevates it above all those aspects of man's being with which they are not identical. Jaspers himself says of this method: "We use a *negative method* of dealing with objects in order to rebound from what is not 'Existenz'" (op. cit. p. 12). However, from this it is already clear (and this is emphasized here) that we are dealing with a process which is thoroughly analogous and comparable to the negative theology. The two other methods utilize, on the one hand, traditional philosophical and psychological terminology in the metaphorical sense for the comprehension of the "Existenz" or, on the other hand, attempt to elucidate the "Existenz" in a symbolical manner with a specific terminology and general terms (which Jaspers calls "signa" and uses in the place of categories valid for the scientific cognition of objects) invented for the existential elucidation. Here we can in any case think of the symbolic theology of Jaspers and Plotinus, and determine that we are dealing with processes and methods which are provided for

the elucidation of the "Existenz" and which are analogous to the philosophical theology of Jaspers and Plotinus. However, this now means that the question of the Neoplatonic influence concerns not only the metaphysics but also the conception of man of Jaspers.

#### B. Plotinus' Conception of the Innermost Essence of Man and the Problem of its Intelligibility

When one views all, that for Plotinus could be called philosophical anthropology, one could say that for Plotinus the region of man's being (on the basis of his belief of the immortality of the soul of man) reaches far further than is the case of a thinker of the 20th century who has passed through several waves of secularization and criticism. Plotinus not only believed in the immortality of the soul but also, as already his master Plato, believed to be able to prove this on rational grounds with logically secure arguments. One only has to compare his writing IV, 7 "On the Immortality of the Soul." He who really desires to have knowledge of man must concern himself above all with this immortal soul which, according to Plotinus as well as Plato, is the actual core of man's being (see also his writing I, 1 "What is the living being and what is man?"). The soul of man (and literally all individual souls) derives from the higher intelligible world, combines in a secular condition with a mortal body and longs, in its secular condition, for the return into its original spiritual home, to which return it is called again after the death of the flesh. The philosophical anthropology of Plotinus can thus be divided into a first part, which concerns itself with the origin of the soul from the intelligible world, a second part in which Plotinus analyses the nature of man in the earthly condition, and into a third part in which the primary theme is the fate of the soul after the death of the body. We will concentrate here on the general conclusions of Plotinus on the nature of the soul and on the soul in the earthly condition (i.e., in its connection with the body) because only for this aspect of the teaching of Plotinus of the soul and man is there a certain comparability with the philosophy of Jaspers which we will demonstrate in the comparing presentation.

For Plotinus there are not many features for the soul and the actual man, also in the earthly condition, which would be particularly suitable for a comparison with the conception of man or the philosophical anthropology of Jaspers. One of the main concerns of Plotinus' philosophical anthropology is namely to protect the highest intellectual core of man which, at the same time, is man's innermost essence, from the being

besmirched by the sensual and bodily which could easily occur by the association of the soul with the body in the earthly life of man. According to Plotinus, this problem occurs due to the fact that the originally purely intellectual soul has linked itself with a body and, together with it, seems to present in the earthly life something that is combined.

The actual essence of man, the true man, according to Plotinus, is only the higher intellectual nature of man (see also I, 1: 7, lff.). The higher intellectual soul of man, which lives purely in the intelligible reality, has at the same time released a second soul which is intertwined in the body and its activities and is directly connected with it (I, 1: 10, 5ff.). Through the higher intellectual ground of the soul, man is related to the World Soul and equal to it (IV, 7: 12; see also II, 1: 5). This higher intellectual nature of the soul is a purely intellectual form which is not touched by the sensual (I, 1: 2, lff.). The higher intellectual ground of man is even related to the eternal divine Intellect, indeed, it can visualize it in a unitary view so that it is in its immediate presence (I, 1: 8, lff.). Also during the temporal, earthly life of man, the higher, intellectual, soul of man remains in the intelligible reality (in a purely intellectual, divine area with the World Soul and with the divine Intellect) and permits only the lower soul, which is virtually appended to the higher, to reach down to the world of the senses (VI, 7: 5; IV, 8: 8; III, 4: 3; VI, 3: 12).

The true man, according to Plotinus, the intellectual ground for the human soul, cannot be easily defined. Plotinus distinguishes three levels in it: the one, the intellect and the soul, which correspond in likeness to the three original divine Hypostases of One, Intellect and World Soul (V, 1: 10, 5-10). Through the last, highest and simple ground of his soul man tries to unite mystically with the One-Good (VI, 9: 10), the intellect in the higher intellect-soul suits the immediate view of the Divine Intellect and its Ideas, the soul, however, can accept the discursive thinking; the intellect of the human intellect-soul attempts intuitively to view the Ideas of the divine Intellect in its oneness and totality, the soul differentiates them in their specific characters and universal relationship (V, 1: 10; V, 1: 11; V, 3: 3; V, 9: 3; I, 1: 8).

Now in a most singular manner, Plotinus has differentiated this higher intellectual ground of the soul, related to the Divine, from a soul of a lower type, virtually as the second soul of each man which penetrates the body and together with it forms a composite (I, 1: 7, lff.; VI, 4: 15; V, 7: 5). Only to this second soul, or the composite

animated by it, does Plotinus ascribe sensory perception, emotions, feelings, sensual desires and even self-consciousness (I, 4: 9; IV, 4: 4).

But this immediately brings us to the problem of the cognition of the higher intellectual ground and the true self-being of man according to Plotinus: from the point of view of the actual consciousness of man, this higher intellectual ground is not really continuously present and directly open to inspection, the intellect and the higher soul of man can have an effect on man, according to Plotinus, even if we are not aware of it, because, again according to Plotinus, temporal self-consciousness is only the reflex of the intellectuality in the perceptual sense and only occurs with the second soul. However, now, the eternal being of the Ideas in the Divine Intellect, according to Plotinus, is in itself perfectly intelligible and the Divine Intellect is approachable to man's intellectual soul in the sense of its cognition. This is similarly valid for the World Soul and its relationship to the intellectual soul of man. Only from the viewpoint of the temporal self-consciousness of man do there arise certain cognition problems but this consciousness of man (and his self-consciousness) is for Plotinus no absolute starting point and the centre of the highest human certainty as for Descartes, and for Plotinus the sensually perceptible and empirical scientific aspects of man's being are not, as for Jaspers, an object of generally valid and compelling knowledge so that the transcendence of the divine intellectual ground of the soul for Plotinus means something different from the transcendence of the self-being for Jaspers.

#### C. To the Comparison of Both Positions and to the Question of the Adoption of Plotinus by Jaspers

The two conceptions of man of Plotinus and the existential philosopher Jaspers do not allow for such good comparisons as the fundamental conceptions of the philosophical theology of Plotinus and Jaspers, although the two philosophical anthropologies of the thinkers being investigated by us can stem from fundamental metaphysical concepts which are very similar. But the historical distance and the philosophical differences between the two philosophers have stronger effects in the region of the philosophical anthropology and the conception of man than in the region of metaphysics.

Also Jaspers recognizes something similar to the belief of the immortality of the soul, but for him this belief can no longer be a conviction of the rational metaphysics even in the sense of Plato and Plotinus.

Plato and Platonism, Plotinus and the Neoplatonism believe that they can prove the immortality of the soul with the arguments of reason and on the basis of the relationship with the intelligible reality of the truly being Ideas and the divine Intellect. But also on the subject of the rational anthropology and psychology and not only on that of the philosophical theology there stands, between the Platonic tradition and Jaspers, the criticism of Kant which subjected not only the proofs of God but also the metaphysical arguments for the immortality of the soul to a critical investigation and thus arrived at a rejection of their scientific basis.

For Jaspers then, the allocation of the self-consciousness of man to the eternity means something other than the teaching of the immortality of the soul for Plato and Plotinus. The "Existenz" realizes in the temporal being ("Zeitdasein") its possible self-being, it appears to itself in the empirically comprehensible aspect of man's being and decides through eternity the sense of its self-realization. For Jaspers, in this sense, the moment as the identity of timelessness and temporality is the immersion of the factual moment to the eternal present. In the historical consciousness, according to Jaspers, a sense of historicity makes man aware of two things in one: of evanescence as a phenomenon and of eternal being by way of this phenomenon—in the sense that, once fulfilled, the temporal particularity is comprehended as the appearance of eternal being, that the tie between this eternity and *this* moment is absolute ("Philosophy" II, p. 111). There is everything to be said for the fact that we are dealing here with an eternity of the fulfillment of the sense ("Sinnerfüllung"), an eternity in the sense of the ethical absoluteness but not of an ontological, and certainly not a rationally verifiable eternity.

If, now, the teaching of the immortality of the soul, as advocated by Plato and Plotinus, does not occur in this manner with Jaspers, then this applies to an even greater extent to the teaching of the higher intellectual ground of the soul by Plotinus and of its cognition, which teaching should in some way correspond to the understanding of the true self-being of man with Jaspers. Jaspers emphasizes very clearly that the true self-being of man cannot be recognized on scientifically compelling, generally valid, grounds in the way that the empirically comprehensible aspects of man's being can be researched and recognized by means of sciences such as psychology, sociology and biological anthropology. The true self-being of man is only comprehensible negatively by means of a leading to the limits in that it is shown what the true

self-being, the "Existenz," is all not, or only symbolically is, in that the terminology of the sciences (psychology, logic) and metaphysics are applied to the self-being in a metaphorical sense or that a terminological instrument is utilized that is conceived uniquely for the existential elucidation (that is, in that so-called "signa", symbolical symbols are used for the existential elucidation).

For Plotinus, however, the higher intellectual ground of man's soul, which is somewhat similar to the true self-being of man by Jaspers, is also not constantly present to the discursive and sensually bound and in itself reflective, self-consciousness of man but is always active in man and linked with the higher, divine, intelligible world of the three original divine Hypostases (One, Intellect, Soul), even if man is not always aware of it. But in itself, it is not unrecognizable but a truly intelligible being as also the, for him, original divine Intellect-Being as cosmos of the Ideas is in itself perfectly intelligible. The approach to the divine intellectual ground of the soul as to the divine Intellect itself is not easy but can only be carried out through an inner resurgence to the intuitive view and to the purely Intellectual. And yet, Plotinus utilizes no negative methods for the purpose of the cognition of the divine intellectual ground of the soul and also does not believe that the approach is only possible by means of symbolic thought. Even when rising up from discursive thinking and the sensual consciousness to the intuitive view, from self-consciousness to the becoming inside of the intelligible totality, then at the most, one progresses from soul to soul, from the derived soul linked to the body to the original intellectual ground of the soul, which is not affected by the sensual but lives in the Intelligible.

The difference between Plotinus and Jaspers with regards to the approach to the divine intellectual ground of the soul or the cognition of the true self-being of man, now becomes clearer in that one visualizes what the positive scientifically recognizable for Jaspers is, opposed to the only negative or symbolic comprehension of the self-being and one then asks oneself whether there is a comparable situation of the theory of knowledge with Plotinus. For Jaspers, the empirically comprehensible aspects of man's being are universally valid through sciences such as psychology, sociology and biological anthropology and are recognizable by means of compelling logical necessities whereby methods of the moral sciences as well as of the natural sciences are assumed. In the total area of the mundane being (not only as regards to man) it is mostly the natural sciences that are active with justified

demands on scientific cognition. In opposition to this scientific cognition, there is now conceived by Jaspers the comprehension of the true self-being of man, the existential elucidation, which is really no longer a scientific, universally valid and logically compelling cognition but which operates only with particular negative or symbolic methods of the existential elucidation.

With Plotinus, however, one naturally seeks in vain for this type of dignity and honour of empirical sciences about the world and about man. As for Plato so also for Plotinus is the sensually perceptible corporeal world not only a reality of lesser (fourth of fifth) level, but also the area of the mere opinion and the uncertain assumption. Plotinus' eternal Ideas, identical with the Intellect according to Plotinus, are in contrast the truly intelligible reality, admittedly not in the sense of a cognition as is known in modern natural sciences, but in the sense of the speculative metaphysics. Thus, one can see that with Plotinus, a completely different situation concerning the theory of knowledge and the theory of science is given as for Jaspers and for this reason Jaspers's conception of man and his ideas of the cognition and approach of the true self-being of man cannot just be compared (or only with difficulty) with the philosophical anthropology and theory of knowledge of Plotinus.

This can be strengthened by a further thought: It was René Descartes who as the precursor of the whole modern philosophy from the 17th century founded all further philosophical certainty in the self-consciousness of the thinking human I about his own existence. With this there emerged to the fore of philosophical reflection the theoretical consciousness of man as the main characteristic of man's nature and the foundation of all scientific cognition. This universal theoretical consciousness also had a further effect (via transmission of Kant) on Jaspers (the consciousness is for him one of the modes of the all-encompassing which man is himself; see also "Of the Truth," I. p. 64ff.). Also from the level of this consciousness, in which for him theoretical clarity and compelling knowledge becomes an event, Jaspers characterizes the extraordinariness of the existential elucidation in its "negative" and "symbolic" aspects. However, something similar to this theoretical consciousness in Descartes, Kant and Jaspers cannot be found in Plotinus. The temporal consciousness of man is not for him the region of greater theoretical clarity and lucidity, rather this is achieved first in the intuitive view of the Ideas and the divine Intellect. That is why here also there is no reason for him to carry out the ascent to the divine intellectual

ground of the soul in a manner which would be comparable in any way or would be derived from the negative and symbolic theology, which for him is the approach to the One-Good as the highest principle of all.

But when Jaspers in his teaching of the true self-being of man and of the methods of the existential elucidation, which *for him* are so related to the process of comprehension of the Transcendence of the Deity, gives the impression of being indebted to the Neoplatonic tradition of thought as also in the philosophical theology or metaphysics, to what can this be attributed, if his conception of man, compared with that of Plotinus, displays such substantial differences? In my view, this can be explained by the fact that Jaspers is above all influenced by Plotinus in his philosophical theology and metaphysics (however, naturally, already in the sense of the highly independent subsequent treatment of the Neoplatonic impulses) and that as a result of inner factors and processes in his existential philosophy, the inner core, or the true self-being of man was conceived analogous to the ultimate Deity, the Transcendence, which had effects especially on Jaspers' teaching of the approach of man to his true self-being and of its intelligibility. Naturally, according to Plotinus, man must first also ascend to the divine ground of his soul if he wishes to comprehend the One-Good as the highest principle of all and then must divest himself of all views of any type (also intellectual) of plurality in order to become perfectly simple and to unite with the One-Good (see also VI, 9: 10f.). But with this, there has not yet been developed a theory of the cognition of the ultimate ground of the soul, which would permit the approach to it only by utilizing the procedure of the negative theology.

### III. The Moral Impulses of the Philosophy and the Metaphysical and Anthropological Foundations of them

Ethics as an independently existing and clearly bounded philosophical discipline exists neither in Plotinus nor in Jaspers. Neither of them wrote a systematic treatise on ethics, as did Spinoza or Nicolai Hartmann, and none of them created connected systematic writings on the totality of practical philosophy as, for instance, Aristotle or Kant. But naturally, ethical themes play their part with Jaspers as also with Plotinus and above all there arises in both, from their metaphysics and their conception

of man, a certain basic attitude on ethics and a concept of ethical modes of behaviour which are to be valued or to be censured and which both thinkers often express.

To close off this treatment, we will now briefly view the ethical aspects and implications of the philosophies of both thinkers. This ethical dimension of the philosophies of both thinkers, as was seen with the comparison of both conceptions of man, will show no very substantial agreement, but it will still be important to explore this briefly because Plotinus and Jaspers are here introduced as representatives of a particular basic moral philosophical attitude.

#### A. Jaspers' Moral—Philosophical Impulses from the Existential Philosophical Interpretation of Man

There can be no doubt that, from the existential philosophical interpretation of man and man's being, there stem moral appeals to humanity, even if Jaspers did not summarize them in an explicitly worked out systematic ethics. We can say, interpreting Jaspers, that it is the vocation of man to transcend the various aspects of being as existence ("Dasein") and being as character ("Sosein") within his human being to reach his true self-being, but it is also the vocation of man to realize his true self-being in the argument with the concrete conditions of his being in the world and in the penetration of aspects of the being as existence and the being as character in his temporal mundane life with intellectual, eternal content. Man can and should bring his true self-being to unfold in connection with other possible self-beings in existential communication, man should be aware of the historicity of his being in the unity of being as existence and "Existenz," of freedom and necessity as well as of temporality and eternity. He should attempt to realize his "Existenz" as unconditionality in situation, absolute consciousness and acts.

It is especially in connection with his presentation on unconditionality in acts and on unconditional acts that the ethical aspects of the philosophical interpretation of man by Jaspers become clear. Jaspers further differentiates the unconditional acts of man from the immediate instinctive actions, the purposive actions and the vital actions out of instinct and reflection which fulfill and drive our conscious being. All these acts are conditional acts. According to Jaspers, however, in the acts of man another can be present in which they are removed from the temporal endlessness of the mundane acts and are returned in a self-being which becomes certain in its acts. This acting from

out of the self-being and for the sake of the self-being is called unconditional acts by Jaspers ("Philosophy" II, p. 255ff.). Unconditionality of acts, according to Jaspers, can be manifested in ethical acts and in religious acts. Unconditionality is, as inner acts, absolute (i.e., existential) consciousness, is freedom, is in the medium of the self-reflection; as acting in the world, unconditional acting is the "Existenz" in the polarity of subjectivity and objectivity ("Philosophy" II, p. 279ff.). Existential ought is in the form of the appropriation by a subjectivity which confronts within itself, as objective, what determines it ("Philosophy" II, p. 311ff., esp. 312). The ought in its objectivity is, according to Jaspers, as existential the irresistibility of the claim of the presence of my self-being on myself. Wherever I am truly myself, says Jaspers, I am not really myself alone. Thus I feel the Transcendence in the unconditionality of the ought on myself ("Philosophy" II, p. 316ff.).

Jaspers himself explicitly expresses in this connection the possibility of a philosophical ethics: because the fixed commands and prohibitions which rationally can be thought of and applied as a set of directions, have lost their absoluteness, there remains, according to Jaspers no ethics possible which announces the truth from the philosophizing of possible "Existenz" but one such which, more decisively, in self-being, reminds of the substance through dialectical discussion. This ethics must not be created abstractly but must grasp the ought in the existing reality of the fellowship of the family, society, the state, from the claim of religion, then in the realm of the communicable cultural products and understandings that connect mankind. The concrete real substance of this ethics, so Jaspers, would appeal to the roots man has in his self-being, traversing the possibilities of action in every direction of the historic world ("Philosophy" II, p. 317).

From all this, one can see with sufficient clarity that, from the existential philosophical conception of man with Jaspers as well as from its metaphysical foundations, there can well arise a specific ethical basic conviction and that an ethics built thereon would be possible. However, this will no longer be dealing with a rational system of ethics or a system of specific commands and prohibitions (as it is characteristic for the ethics of a particular religion), but only of an ethics of the self-being, which gives indications of the concretizing forms of a particular existential basic conviction.

## B. Ethical Implications of Plotinus' Metaphysics and Anthropology

As with Karl Jaspers so the ethics of Plotinus also corresponds fully to the conditions and truths of his conception of man and his metaphysics: with Plotinus, the ethical determinations and directions, which he certainly provides, have their very particular systematic place in the whole of Plotinus' metaphysics and anthropology, without the ethics being fully developed as a particular individual discipline which can be autonomously detached from the whole of the philosophy. The ultimate determination of man, according to Plotinus, is to return again to the One-Good after the descent from the One-Good as the highest principle, which all souls have trod over the footsteps of the Divine Intellect, the Idea Cosmos and the World Soul in the corporeal world and to arrive again in a form of intellectual ascent to the One-Good as the ultimate origin and the ultimate ground. The ethics provides some directions for this, how this ascending path is to be trodden and which ideals are to be used as guides.

The ethics of Plotinus, which is primarily meant to enable man to return to the One-Good as the highest principle, because this type of behaviour is the morally best one and which has provided the nearest approach to the One-Good, attempts to reach this goal of the nearest possible approach to the ultimate Deity and a similarity with it, above all through the cleansing of the soul of all corporeality and sensuality.

Because the soul only does wrong and evil in that it errs and that this error occurs substantially because of its being chained to the body and because of its fascination by the world of the senses, it is the task of the soul not to change its innermost God-related nature, but much rather to elevate itself through cleansing from the sensual to its original determination. This can occur, according to Plotinus only in a preparatory manner, through the actual political virtues which still have a relationship to the practical activity and external world and which set the effective boundaries to the affections of persons as well as preventing incorrect opinions. The actual cleansing is first carried out by means of the higher theoretical virtues. Only when referred back to the pure view of the intelligible realm do Plato's four cardinal virtues, which as political or practical virtues only have a propaedeutic character, receive their highest sense and attempt to assist in an approach to God (see also in Plotinus' "Enneads" the treatise I, 2; for the ideal of the *ἀποιώσις θεῷ* see already Plato's "Theaetetus" 176b).

Thus, according to Plotinus, man never approaches the last aim and the highest determination in practice but always in the theoretical

view and that is why, in the teaching of the ascent of the soul to the highest principle, the differentiation of various levels of perception and cognition, which is only understandable in connection with his metaphysics, has a particular meaning: the sensual perception, which by Plotinus is interpreted as a mere image of a perception directed towards the intelligible, in the framework of the intellectual ascent, is placed only on the lowest plane (I, 1: 7; V, 3: 9; VI, 7: 7). Above all kinds of perception is set conceptual knowledge, i.e., the differentiation and comparing of the idea dialectic which comprehends the intellectual reality methodically and receives the principles from the Intellect (I, 3: 4f.). But beyond this still discursive process, there exists for Plotinus the immediate thought and view of the over-sensual in the unity with the divine Intellect, in which the intellectual soul is not simply identified with the higher reality, but, despite all oneness with the divine Intellect still retains its own existence as intellectual soul (V, 3: 4; VI, 7: 35; IV, 4: 2). However, with this level, the ascent of the soul is not ended. In order that man truly achieves the ultimate and highest determination, the soul of man must unite beyond the divine Intellect with the origin and fundamental ground of all, the One-Good, and only here is the union free of any boundaries. In the One there is no duality. In this way, the own existence and special consciousness of the soul are perfectly erased. It unfolds fully in the One as the highest principle and finds itself in it with the centre (of itself as man) in the centre (of the whole reality). This soul thus partakes of the mystical condition of the ecstasy, a beatific condition of satiated peace in which the soul, having arrived at its destination, lets all behind it and scorns all thought that was once so loves because it is movement, but it wishes to remain unmoved as also the first is unmoved (VI, 9: 10; VI, 7: 35).

The principal feature and the main tendency of Plotinus' ethics is very clear from what has been said above: this ethics seeks to lead man back to the ultimate and highest divine intelligible realities and to the highest Deity as the highest principle. The true determination of man, according to this ethics, exists in the return and finally and ultimately in the union with the divine absolute origin and ground from which man stems. The ought of man, his divine obligations, does not refer in Plotinus to the acts in this world and in a state, but much more to the contemplation, the theory, the view of the Deity. The theoretical and cathartic virtues are for Plotinus rated far above the ethical, i.e., practical virtues, which refer to the practice and especially

the political acts, in a manner that would be unthinkable for Plato (a classical philosopher *also* of political philosophy; Plotinus' distinction corresponds rather to the differentiations of Aristotle concerning the virtues).

One can ask oneself whether this ethics and this moral basic attitude to life is nothing but a withdrawal from the world and whether its attitude towards the sensually perceptible world of the phenomena is fully negative and depreciative, whether it depreciates the practice as against the theory as it does the body compared to the soul. The obvious tendency with Plotinus is undoubtedly in this direction but Plotinus (as a historical phenomenon) does not seem to have taken this road to the end (up to an absolute asceticism of the way of life and up to the absolute rejection of the world). However, he can acclaim similarly to Plato, the beauty even of the visible world as a well ordered whole (compared to Gnostic disparagements) and the body and the sensible world for Plotinus (as for Plato) is nevertheless, even when it is the lowest level, at the bottom of a value hierarchy which leads to the perfect beauty of the Idea and the divine Intellect (see also Plotinus V, 8 and with Plato: "Symposium" 210a ff.). This, now, leads us finally to a comparison of the fundamental ethical attitudes and of the fundamental convictions of the ethics of Plotinus and Jaspers.

#### C. To a Comparison of Both Positions and to the Question of the Adoption of Plotinus by Jaspers

Plotinus' ethics is an ethics of the inner ascent to the intelligible world, to a region of the Divine and the Intellectual, and finally to the perfectly simple and perfectly good highest principle of all. This ethics contains also tendencies to flight from the world and world rejection (when referred to the sensible world of the phenomena). Indeed, it cannot deny certain ascetic features (with the limitations which I mentioned in 3 B).

The ethics of Karl Jaspers (or what one can summarize as the ethical fundamental convictions of this existential philosopher) is also concerned with the inner ascent of man to his true self-being and to the Transcendence (the Deity). But with Jaspers, that intellectual path which leads man (in the search of his determination) always beyond the various aspects of being as existence ("Dasein") and being as character ("Sosein") in order to reach the true self-being of man, the "Existenz," must always be supplemented with another intellectual path with other, if not opposite direction, namely the tendency to a philosophical penetration of the

being and consciousness aspects of man's being with the true self-being of man, the "Existenz," which comes to the fore in this penetration process and thus realizes itself for the first time. Man, according to Jaspers, cannot be his true self if he does not transcend all being as existence and as character within his human being, but he also cannot realize his true self-being if he does not penetrate from his "Existenz" to his being as existence and as character in the world in order to take it up in his very own responsibility. A fleeing from the world and a rejection of the world, and in this sense an ascetic component, cannot therefore be found in Jaspers' ethics (in comparison to that of Plotinus).

One could further clarify the difference between Plotinus and Jaspers in that one applied the terminology of the Platonic metaphysics of Plotinus also to the existential philosophical conception of man of Jaspers (Jaspers, himself did this by way of hints) and compares the true self-being of man by Jaspers with the intellectual ground of the soul by Plotinus. True self-being of man and empirically conceivable aspects of man's being with Jaspers would then relate somewhat to each other as the soul-intellect of man to the body as the corporeal dimension of man with Plato and Plotinus. On the background of this parallelism, one could say the following of the (anthropologically and metaphysically based) difference of the two ethics: with Plotinus, the incorporeal soul, before its incorporation, descends from the intelligible region into the corporeal world, unites with the body but remains, for its earthly life, connected with the higher intellectual world and has (this is the ethical component) the vocation to return wholly to the higher intellectual world in that it frees itself step by step from the body and the fascination with the senses. With Jaspers, now, the point of view of the philosopher in his actual thinking is limited wholly by the life of man in this world, because only of this (according to Jaspers) can a sensible philosophical account be rendered. Man, though, has the vocation to elevate himself above the aspects of being as existence, consciousness and character within the human life in the world and to achieve the true self-being of man in view of the Transcendence (God's). But the vocation of man is not to leave the world, to strip off the bonds of the soul as soon as possible and to unite eternally with the Transcendence (God). This, for Jaspers, is not the aim of the ought for the reason, on the one hand, because man just does not possess sufficient insight to envisage such an otherworldly objective and, on the other hand above all, for the ethical reason, because the final free core of man, the "Existenz," is responsible for the earthly

factual empirical appearance aspect of man's being and has the task of penetrating it intellectually and besides can realize itself only in it.

In summary, one can say that the ethical appeal which originates from the existential philosophical interpretation of man in Karl Jaspers, although on the one hand it is inspired by the tendency of the transcending over the world, existence and empirically conceivable aspects of man's being (as also characterizes the metaphysics, the conception of man and the ethics of the Neoplatonic Plotinus), on the other hand it is characterized by a decisive turning to the world and being and to the earthly aspects of the man's being as it can be found in no manner in Plotinus. The reasons for this turning to the world and affirmation of being in Jaspers (in comparison to the rejection of the world and of being by Plotinus) are, in my point of view, metaphysical anthropological as well as genuinely ethical. On the one hand, as already mentioned earlier, Jaspers has passed through the epistemological critique of Kant and, as a man of the 20th century who is impressed by the thinking of the empirical sciences, dares not speak seriously of the pre-existence and post-existence of the soul. A peculiar anthropological basic conviction in the existential philosophical sense allows him, furthermore, to assume a mutual reference and dependence of self-being and being as existence, soul and body together: the being as mundane factual given is in itself unfulfilled, it still requires the self-being, which penetrates it philosophically and attempts to fill with sense. The self-being, in reverse, attempts to realize itself only in the temporal appearance of the being of the world. On the other hand Jaspers is also inspired by genuine ethical reasons to affirm from the inner outwards this relatedness and dependence of the self-being on its appearance in the temporal being. Man in his self-being, man as "Existenz" has a moral responsibility for the world in which he lives and for the being ("Dasein") in which he realizes himself.

What on the whole, finally once again, (this time in view of the ethics) refers to the question to be put, in how far Plotinus has a certain influence on Jaspers or (seen from Jaspers' point of view) there is an adoption of Plotinus, the question must be answered in the sense that with Jaspers, especially in the ethical field, one can talk of an adoption of Plotinus only insofar as the ethics of Jaspers follows a fundamental impulse of the ethics of Plotinus (which indeed is itself again the consequence of his metaphysics and conception of man). Insofar, however, as the basic direction of the ethical desires and thinking

of Jaspers differs from that of Plotinus, one would have to assume with Jaspers not an adoption and intellectual approach to Plotinus but much more a critical dispute with him.

One finds the critical dispute with Plotinus especially in the "Critical Characteristic" by which Jaspers supplements his presentation of the philosophy of Plotinus as a metaphysician who thinks out of the origin, in the first volume of his work on "The Great Philosophers" (p. 712-719). This criticism by Jaspers of Plotinus substantially confirms what we have said of the difference of the conception of man and the ethics between Plotinus and Jaspers.

What now concerns the adoption of Plotinus by Jaspers is also valid for the ethical consequences of the philosophy of Plotinus which we have already presented in connection with the influence of Plotinus on the conception of man by Jaspers: Plotinus had an effect, above all, on the metaphysics of Jaspers. The metaphysics of Jaspers itself, with its clear Neoplatonic affinities is fundamental for the existential philosophical interpretation of man, and through its consequences in the ethics, a part of the ethical fundamental convictions of Jaspers are inspired by Plotinus.

## The Place of Neo-Platonism in the Post-Modern World

Christos C. Evangeliou

### Introduction<sup>1</sup>

The appellation "Western" is perhaps inappropriately applied to the products of Ancient Greece, especially Hellenic philosophy. For neither the spirit of free inquiry and bold speculation, nor the quest for human perfection via autonomous virtuous activity and ethical excellence survived, in their Hellenic form, the imposition of inflexible Church doctrines and practices upon Europe with the coming of Christian faith and the theocratic proclivity of the Churches, especially the hierarchically organized Catholic Church.

Yet, these noble ideals had been embodied in the lives, and expressed in the theories, of genuine Hellenic philosophers for many centuries, from Pythagoras to Plato, to Plotinus, to Porphyry, and beyond. Since the Renaissance, several attempts, primarily by Platonists, to revive the free spirit, and the other virtues of Hellenic philosophy, have been invariably frustrated by violent reactions of Christian movements, such as the Reformation, the Counter-Reformation, and the religious wars which followed.<sup>2</sup>

Thus, while modern science somehow succeeded, after much struggle with the Catholic Church, in freeing itself from the snares of Medieval irrational restrictions, and thereby it managed to reconnect itself with the scientific spirit of late antiquity and its great achievements (especially in the fields of cosmology, physics, mathematics and medicine which enabled it to advance);<sup>3</sup> the main stream of "Western philosophy" has as yet failed to do so. As in the Middle Ages, so in modern times philosophy has continued to play such undignified and servile roles as *ancilla theologiae*, *ancilla scientiae* and, with the coming of Marx's "scientific socialism," *ancilla ideologiae politicae*. In this respect, "Western philosophy," as it has been historically practiced in Europe, is a very different

activity from that noble and autonomous intellectual discipline which the Ancient Hellenes named *philosophia* and honored it as the queen of arts and sciences to which it had given birth.<sup>4</sup>

Consequently, as we stand at the end of the twentieth century and at the beginning of the Post-Cold War era; as we witness the collapse of Soviet-style socialism and the coming of the post-modern era; as we look at the dawn of a new millennium and dream of a New Global Order, the moment would seem propitious to stop and reflect upon our philosophical past as exemplified in the free spirit of Ancient Hellenic philosophy and its many misfortunes, its long passion, if you like, in the West in the last two millennia. From such a vantage point, it would seem imperative that the philosophic freedom and its concomitant religious tolerance, as experienced in the Hellenic pre-Christian era, be revived and fostered in the post-modern world of today and tomorrow, if our global, fragile, and culturally diverse community is to be preserved and allowed to flourish in the dawning new millennium.

In my view, Neoplatonism, as a form of successfully revived Platonism in late antiquity, has much to contribute to the noble goal of our common cultural preservation and global flourishing. Representing, as it does, the last phase of the free spirit of Hellenic philosophy in late antiquity, and having played the key role of defending Hellenism against every form of barbarism, Neoplatonism can become once again the avant-guard of a new movement to restore philosophy to its ancestral dignity by reviving the philosophic spirit of freely theorizing about nature and culture, and by acknowledging no other authorities besides reason.<sup>5</sup>

Before closing my introduction, let me add parenthetically that, as a life long student of the history of Hellenic philosophy, I have been puzzled by the facility with which European historians of philosophy attempt to appropriate the heritage of Hellenic philosophy as their own exclusively, and to make it part of what they call "Western philosophy," which they oppose to the Eastern philosophies with arrogant Nordic contempt.<sup>6</sup> More recently, in my trips to Greece and to India, I was surprised to discover that even these non-Western and remote peoples have uncritically accepted the above false claim and artificial division between East and West, with Ancient Greece and its glorious philosophy placed, firmly but unwisely, in the West. Unexpectedly, I encountered strong resistance from Greeks and Indians, when I tried to enlighten them

about the falsity of the Northern European arrogant, exclusive, and unjustifiable claim to the heritage and glory of Ancient Hellenic philosophy.<sup>7</sup>

I would like, therefore, to take this opportunity to express some of my unorthodox views regarding the question of the so-called "Western philosophy" and its alleged connection to, and continuity of, the free spirit of inquiry of genuine Hellenic philosophy.<sup>8</sup> In what follows I shall argue that the appellation "Western" is a misnomer when it is applied to Ancient Hellas in general, and to Hellenic philosophy in particular which, on the artificial balance of "West versus East" conventional division, has historically inclined invariably towards the culturally more refined East.<sup>9</sup> I shall also argue that the reason for which the Theocratic West, as a matter of historical fact, did not develop any schools of genuine philosophy comparable to the many and diverse schools of Democratic Hellas, is directly related to a terrible misfortune which befell Europe and from which it has not, as yet, completely recovered. By this I mean the coming into being of two aberrations of Judaism,<sup>10</sup> which are euphemistically called Christianity and Islam. These two monotheistic religions have been, by their own dogmatic theologies and theocratic proclivities, historically proven to be intolerant not only of other Gods and Goddesses but also of Lady Philosophy as the Ancient Hellenic philosophers envisioned genuine *philosophia*, that is, free and unfettered inquiry into the nature of all things including truth, beauty, goodness, and human and divine beings.

A note of clarification is called for, and I wish to be very clear on this important point. The expression genuine *philosophia* is intended to capture, I repeat, the original sense in which φιλοσοφία was understood by Hellenic philosophers during the millennium of their activity from Pythagoras to Proclus. The Ancient Hellenes practiced philosophy in at least two essential ways which have been conspicuously absent from Western Europe:<sup>11</sup> First, philosophy as a free, unfettered, and intelligent search for truth regarding the nature of Nature and the nature of Man; and secondly, philosophy as an authentic way of life which is self-sufficient and active in accordance with both kinds of Hellenic excellences, intellectual as well as ethical.

### I. The Ambiguity of "Western Philosophy"

In the expression "Western philosophy" two ambiguous terms are connected closely and repeated so frequently that the confusion generated by such infelicitous juxtaposition almost cries out for clarification. Regarding the first term "Western," one would be taxed to point out, in the globe which revolves round the sun and makes day and night, where on Earth the East stops and the West begins. Even if we follow the conventional wisdom and allow that Iceland and England are definitely in the West, while Korea and Japan, for example, are definitely in the East, where shall we rightfully place countries like Greece and India? Both are to the East of the first pair, but to the West of the second pair. Hence the problem. One may think that the problem can be easily solved by comparing the two countries directly to each other, in which case it can be said that India is definitely in the East and Greece in definitely in the West relative to each other. But perhaps the situation is more complex than it appears to be at first glance.

For, even if the Indians were to go along with this solution, I suspect that the Greeks would have great difficulty accepting it for the following reason. Geographically Greece belongs to "Eastern Mediterranean;" at our time, as in ancient times, Greece occupies the tiny peninsula and the Aegean sea where three continents meet: Africa, Asia and Europe. This fact perhaps explains why the Ancient Hellenes conceived of the strange notion that the center of the world, "the navel of the Earth" as they used to say, was right there in the middle of Hellas, at one of the peaks of Parnassos. It was there, at the holy shrine of Delphi where Dionysus, the god of music and dance, rested from his long journey from India through Asia and Africa, according to ancient legend, and was welcomed by his brother Apollo, god of light and reason. In this way the East and the West came together and from their harmonious union the Classical Hellenic civilization emerged among the other civilizations of the great rivers: the Nile, the Euphrates, the Indus, the Ganges, and the Yangze.<sup>12</sup>

In terms of Geography, then, the Modern Greeks, like their ancestors or like any sensible people, may think of themselves as Westerners when they face towards the rising sun, but when they turn around and face the setting sun they consider themselves as Easterners or, at least, as non-Westerners. Even if we turned to

History for assistance, we would find that it provides no greater help than Geography for the correct characterization of the place of Hellas and its philosophy: Western or Eastern? Historically speaking, from the time of the rise of Rome to political power in the third century B.C. to the Italian Renaissance in the fifteenth century A.D., the Hellenic and the Hellenistic Hellas, and even the Byzantine and Christian Greece, had invariably identified itself with the culturally more refined East, in Conscious opposition to the Latin West which to the Hellenic minds and eyes of that time, as opposed to Modern times, appeared as a synonym of barbarity.<sup>13</sup>

Thus when the Roman Empire was divided into two in the end of the fourth century A.D., the division created the Latin Western and the Greek Eastern Roman Empires. Perhaps ironically, History was to repeat itself in the eleventh century, when a schism occurred in Christianity between the Catholic Church which was not surprisingly Latin and Western, and the Orthodox Church which was, again not surprisingly, Greek and Eastern.<sup>14</sup>

These historical considerations seem to tip the balance of placing both Ancient Hellas and Christian Greece definitively toward the East in the artificial division between East and West. But this is not the end of the story. Since the Crusades, and more so with the rise to prominence of such European powers of France, England, and Germany, the ex-barbarians of the West and the North thought that they would gain some respectability if they presented themselves as inheritors of the Ancient world and its culture. Thus they boldly claimed as their own not only the Latin, but also the Hellenic, Classical heritage which they began, at that specific time, to characterize as "Western" and oppose it to the Eastern Orthodox (and to the Islamic) world.<sup>15</sup> Intellectually awoken Greeks have always remained somewhat skeptical about the applicability of the appellation of "Western" to their ancestral culture and about the truthfulness of the arrogant and unjustifiable Nordic claim. However, the Northern Europeans have been successful in persuading almost the entire world that there is no real difference between themselves, in the role of the builders of colonial imperialism, and the creators of Classical Greek civilization and philosophy.<sup>16</sup>

The unfortunate result of these activities of the Europeans has been that the Ancient Hellenes are uncritically identified as Westerners at the present, and they are placed in the same basket

with the British, the French, the Dutch and German colonialists of Africa and Asia, not only by the Northern Europeans themselves but also by many African and Asian peoples as they struggle for ethnic identity, national recognition, and social reconstruction against the odds which were left overs by European colonialism. This outcome is certainly unfair to the Ancient Hellenes; but it is also unjust to the African and Asian nations which, as a result of the Northern European exclusive claim to the Classical Hellenic heritage, cannot readily perceive the falsity of such claim at their own expense. For they are slyly deprived of a valuable ally, the treasure of Hellenic culture and philosophy, in their present pedagogical, political, intellectual and cultural endeavors. This is tragic. The European claim is an unholy monopoly of the worst possible kind.<sup>17</sup>

It is time that the fraud be exposed and the truth be told to all who have ears to hear the simple truth that the achievements of the Ancient Greeks do not belong exclusively, or even primarily, to the Christian West or to Islamic East. They belong to the World at large and to the suffering mankind, especially to those remnants of pre-Christian and pre-Islamic traditions and cultures, with which the Ancient Hellenes had many affinities including: the love of human and undogmatic wisdom, as opposed to the dogmatic and divine "wisdom" to be found in some sacred books; and the tolerant worship of many Gods and Goddesses, as opposed to the monomaniac folly of masculine monotheism and its concomitant bigotry, intolerance and fanaticism as historical characteristics of the Western ethos. Working together those of us who value these old traditions can bring about a revival of philosophy of the genuine kind, perhaps here in America, this great land of the free and the brave, whose democratic institutions have been characterized by relative tolerance and diversity at least till now.<sup>18</sup>

## II. Hellenic Philosophy Delineated

Since the previous observations have shown that Ancient Hellas and the West have, historically and geographically, stood at opposite poles; and since philosophy is legitimately connected with Ancient Greece, it follows that the expression "Western philosophy" as used and abused by Northern European historians

of philosophy, becomes problematic. Besides, if we were to grant the Northern Europeans their wish to remove Classical Hellas from the middle place which it has historically occupied between the East and the West, the South and the North, as a beacon of light available to every part of the world which seeks philosophical enlightenment; and, furthermore, if we were to allow the Northern Europeans, especially the Germans, to claim as exclusively their own the Hellenic Classical heritage, especially Hellenic philosophy which, by its very nature, has an ecumenical and pan-anthropic appeal;<sup>19</sup> then we would be doing a disservice, as I said earlier, to our students and our children who deserve a better future, a life with more genuine humanistic *paideia*, and with less racial intolerance and even lesser religious fanaticism.<sup>20</sup>

From these considerations the following central question arises: Has the Christian West, impartially seen as an entity separate and different from Ancient Hellas, and narrowly defined as the barbarized Western part of the divided Roman Empire, in its millennial history produced any philosophers or philosophical schools which are comparable to the schools of Hellenic philosophy or to Indian and Chinese schools of philosophy for that matter? This is an important and complex question which cannot be answered with a simple and short answer. The nature of the answer depends on the meaning to be assigned to the word *philosophia* which, like the word *demokratia*, is a very attractive Hellenic concept and, thus, it has been much used and abused by many in the European West who, as Plato said, would like to seem rather than be philosophers.<sup>21</sup>

What, then, is philosophy? What is this wisdom with which great minds, the authentic philosophers, are said to fall in love? What exactly did the glorious Hellenes mean with this beautiful word *philosophia*, and how did they distinguish the genuine from the seeming philosophers of their time whom they called Sophists?<sup>22</sup> In a broad sense, there is nothing mysterious about the inborn and burning human desire to learn by opening the eyes and the mind to the natural and the cultural world around us; by asking difficult questions both as teachers and as students; and by trying to the best of our ability to articulate reasonable, responsible, and honest answers to such questions.<sup>23</sup> But if we were to be asked to isolate any specific criteria by which an authentic philosopher would be distinguished from his/her "homonyms," then in the light of the

long history of Hellenic philosophy we would not be far off the mark, if we specified the two kinds of Hellenic excellence, intellectual and ethical, as such criteria.<sup>24</sup>

According to this delineation of genuine Hellenic philosophy, one can say that a genuine philosopher is both a noetically self-sufficient and an ethically autonomous human being, which means that he/she has accomplished two important philosophical tasks.<sup>25</sup> First, he has thoroughly examined himself; he has, for a long time, carefully observed the natural and the cultural world around him; he has respectfully studied the works of other great minds and has freely discussed with his friends the great questions of life; and after a prolonged and serious thinking, he has possibly formed a cosmo-theory and/or bio-theory, which articulates his insight into the nature of things and his own nature, the human nature, so that he can give a reasoned account of it and he can teach those who may wish to listen and learn from his acquired human wisdom.

Secondly, the genuine philosopher does not only teach his wisdom, but also and more importantly, he practices his teaching in his own daily life; for he is ready and willing to hold himself up to higher ethical standards than the ones which his society demands of its members; and he is prepared to set the value of his philosophic freedom higher than life itself, and much higher than wealth and material goods of any kind. By so doing, the genuine philosopher naturally sets his lived philosophy as a model way of living for his pupils and others fellows who may wish to follow. Like Socrates and Plotinus, he has become an enlightened man, a passionate lover of truth, a gentle teacher by word and by deed, and a beacon of light for those who might desire enlightenment.<sup>26</sup>

This is, in brief, the noble portrait of the ideal philosopher as envisioned and occasionally realized by many of the Ancient Hellenes and other non-Western persons who were able to look at the cosmos, at their political institutions, and at their inner souls and minds as free human beings, without the fetters of any dogma, least of all any ecclesiastical dogma backed by the rhetoric and the sophistry or, even worse, by the fear and the terror of some entrenched Theocracy. This being so, next the crucial question arises: What happened to this noble philosophical ideal in the West?

### III. From Hellenic Philosophy to "Western Philosophy"

Judging by the two specified standards, as set by the Ancient Hellenic philosophers,<sup>27</sup> I doubt seriously that one will be able to find many or any of the so-called "Western philosophers" who would be able to meet the two mentioned criteria, especially the second. Let me explain my skeptical pessimism on this important point. By the criterion of noetically self-sufficient inquiry, anyone who takes divine revelations on faith (although they are found in old books of uncertain origin), and then uses "philosophy" (that is, philosophical terminology and arguments) to justify religious dogma on behalf of some established theocracy, as Christian and Moslem theologians, jurists, and orators have traditionally done, is clearly disqualified from being called a genuine philosopher, as the Hellenes understood and used this honorable name, and as we delineated it above. He may be a good writer and/or a sharp-tongued advocate of the cause of his sect, but a philosopher he cannot be, according to our first criterion.<sup>28</sup>

Similarly, by the second criterion of autonomous, exemplary, and self-sufficient life of ethical excellence, any one who may seriously believe in the efficiency of divine grace by baptismal ablutions in holy waters, and other sacraments of this kind, to produce and sustain a life of integral virtue, as Catholics, Protestants and other Christians and Muslims traditionally have believed, cannot be called a genuine philosopher. He may be a good man or even a saint, but a philosopher, in the Hellenic sense of this hellenic word, he will never be, for a genuine philosopher is expected to rise to human perfection by human means, that is, by virtuous activity at each case and under any adverse conditions.<sup>29</sup> In this light, and considering the fact that Western Europe, in the last two millennia, has served under the double yoke of Catholic scholastic dogmatism and Protestant puritanical fanaticism, it is not surprising that philosophy, in the Hellenic sense of the word, has not flourished there, and that genuine philosophers are conspicuously absent from the scene of "Western philosophy."<sup>30</sup>

Some may find it perhaps amusing, but it is really sad to see how cautious the philosopher-theologians, and other so-called "philosophers" of the Western European type, have been in their writings lest they go against the received dogma of the respective Church and, thus, upset the ecclesiastical authoritarian hierarchy.

The list of such persons is long and would certainly include not only Augustine, Aquinas, Bonaventure, and other theologians and Church Fathers, but also Modern "philosophers" such as Descartes, Berkley, Leibniz, Hegel, and many more men whose purpose for philosophizing seems to have been either to explicitly provide support for the revealed dogma or, implicitly, to make room for the revelations of Christian faith, especially in its Protestant and Catholic formulations in Western Europe, as defined above.

It is true that in the last four or five hundred years several attempts have been made to revive the Classical Hellenic spirit of free, autonomous, and self-reliable inquiry but, philosophically, they all have failed and, for the most part, have been abortive.<sup>31</sup> For example, the hope that the opening of the Florentine Academy, during the Italian Renaissance in the fifteenth century, would lead to the rebirth of "Platonic philosophy" in its Hellenic version, as opposed to its Christian and Islamic versions, was cut short by the coming of the Protestant Reformation from the Teutonic North.<sup>32</sup> Moreover, "the Age of Reason" of the late seventeenth and early eighteenth centuries, on which the French *philosophes* had built their dreams for a Europe freed from religious oppressive dogma, ended up with the formation of the Holy Alliance and the coming of German Romanticism and the concomitant obfuscation. Once again, "Western philosophy" was turned into a handmaid of Lutheran Protestantism as it had been of Catholicism earlier on.<sup>33</sup>

These historical examples clearly indicate that up to the nineteenth century no genuine school of philosophy in the specified sense had appeared in the horizon of the Western world.<sup>34</sup> But the situation, significantly, has not changed since that time, in spite of the multiplication of "isms" coming out of Northern Europe in rapid succession: Marxism Existentialism, Phenomenalism, Nihilism, Deconstructionism, etc. These movements and their protagonists may make much noise, but they are ephemeral phenomena passing away. They can be fairly classified into several categories none of which can pass the two tests of genuine philosophy as specified above.

Be that as it may, the recent collapse of communism and the discrediting of Marxism; the disillusion that science will find the ultimate "truth" by chasing the Platonic "Great and Small" which keeps becoming smaller or greater without apparent end; and, above all, the end of the Cold War and the coming of a New Global Order,

has given some hope for the possibility of philosophy's rebirth. Hence the urgent need for the philosophically minded to return to their genuine philosophical roots, which are pre-Christian and pre-Islamic, in search for a new inspiration for the new millennium.

#### IV. Conclusion

The lesson to be learned and the conclusion to be drawn, by any person with an open mind and a sensitive soul, is that Hellenic philosophy in general, and the Platonic and Neoplatonic tradition in particular, do not belong exclusively to the Northern Europeans despite of their claim to it. Rather it belongs to the global world and to mankind as a whole by reason of its perennial and ecumenical virtues, including the freedom to theorize and the responsibility to perfect ourselves, i.e. body, soul, and mind.

What we need at the present is some serious search for a way to reconnect with the interrupted ancient tradition of Platonism and Neoplatonism in order to be able to possibly recover a measure of the lost spirit of Ancient *Philosophia* with its expressed love of free speculation, its polytheistic tolerance of "the other," its diversity of methods, and its pan-anthropocentric appeal. The friends of Plato and Plotinus, of Porphyry and Proclus, of Pletho and all other Platonic lovers of wisdom, are called upon to try once again to restore philosophy to its ancestral autonomy, dignity and glory. The task is a noble one. May the Platonic Friends be more fortunate than the Platonists of the Florentine Academy and the Cambridge Platonists were, as they labor under the protection of Athena!<sup>35</sup>

Towson University, USA

#### NOTES

1. In this essay, I will be able to provide only the main points and arguments in support of a challenging thesis which is still evolving. When fully developed, it will be published as a monograph under the tentative title: *The Passion of Philosophy in Europe*. In its present form the paper was presented at the XII International Conference on Neoplatonism and Contemporary Thought, which was organized by the International Society for Neoplatonic Studies, on May 25-28, 1995, at Vanderbilt University, Nashville, Tennessee. A shorter version of the

- paper was published in *The Journal of Indian Council of Philosophical Research* XII, 2 (1995): 27–38.
2. The most promising and, therefore, the most sadly frustrated, was certainly the movement of revival of Hellenic philosophy in the fifteenth century, which was initiated by the great representative of Platonism, George Gemistos or Pletho, who opposed the Christianized and Islamized “philosophy” for reasons which will become apparent as we proceed further into my thesis. See also on this my “Pletho’s Critique of Aristotle and Averroes and the Revival of Platonism in Renaissance” in *The Journal of Neoplatonic Studies*, (forthcoming); and C.M. Woodhouse’s excellent monograph, *George Gemistos Pletho: The Last of the Hellenes* (Oxford: Oxford University Press, 1986).
  3. Many of us who take pride in the achievements of modern science tend to forget that many of these discoveries would have occurred a millennium earlier, had there not been for the discontinuity of the Hellenic scientific and philosophical tradition, brought about by the otherworldly orientation of the early Christian Church and its terrifying eschatology which proclaimed the end of the World!
  4. According to Aristotle, one of the outstanding practitioners of Hellenic philosophy, the noble character of this discipline is described as follows: “Evidently then we do not seek it [philosophy] for the sake of any other advantage: but as the man is free, we say, who exists for his own sake and not for another’s, so we pursue this as the only free science, for it alone exists for its own sake” (*Metaphysics* 982b 24–27). It is doubtful whether Northern Europeans would have been able to appreciate the nobility of this Hellenic pursuit, either during the Middle Ages, when they used “philosophy” to justify religious revelations, or even during Modern times, when they used “philosophy” to justify political revolutions and greedy pursuits of power over Nature and Nations. In so doing they involved the entire globe in disastrous wars.
  5. The changed global conditions in the last five centuries permit the friends of Hellenic philosophy to be cautiously optimistic that they will have better luck than Pletho and his Florentine friends. But, as genuine lovers of wisdom know so well, working diligently for a noble cause, like any other virtuous activity, is rewarding in itself regardless of the final positive or negative outcome.
  6. Two typical cases of such historians of philosophy, E. Zeller and W.K.C. Guthrie, I have discussed recently in “Ancient Hellenic Philosophy and the African Connection,” *Skepsis* 4 (1994): 4–67.
  7. The Conference on The Role of Philosophy in the Formation of Unified Europe, was organized by the International Center of Philosophy and Interdisciplinary Research at Ancient Olympia, Greece, August 1992; while the Conference on Neoplatonism and Indian Thought, was

- organized by the International Society for Neoplatonic Studies in cooperation with The Indian Council of Philosophical Research at Delhi, India, January 1992. I expressed similar views also in the lectures which I gave at several Indian universities during my short visit. What made my visit to India enjoyable and exciting, besides the traditional Indian hospitality, was the natural Indian inclination to philosophy, both of which reminded me of the Ancient Hellenes. Although the traditional hospitality is still alive in Greece, philosophy, as the Ancient Hellenes understood it, is as dead there as it is in the rest of Europe in which the Modern Greeks are eager to become incorporated.
8. In this light, K.S. Murty’s following statement would seem over optimistic and only partly correct with certain qualification: “I think modern India and Europe can and do understand ancient India and Greece, and the West and East also can and do understand each other:” *Philosophy in India: Traditions, Teaching and Research* (Delhi: ICPR, 1991, revised edition), p. 201. I would not like to be such a pessimist as to doubt the possibility or potentiality of understanding (that is, the modality of “can”), but the historical facts (that is, the modality of “do”) do not support Professor Murty’s claim at least in so far as it concerns Modern Europe and Ancient Greece. For, philosophically, they are poles apart because of the intervening dogmatism and oppression of Christian and Islamic theocracies and theologies which have affected deeply the European mind. So, if we want to find a “kindred spirit” which resembles the philosophically free, diverse, playful, undogmatic, and tolerant spirit of Ancient Hellas, we should look to Ancient India rather than to Western Europe. That is our only hope for a better future, philosophically speaking. For Northern Europe whether in its Medieval, Modern, or post-Modern mental and cultural outlook, would seem more like an aberration of Ancient Judaism than a legitimate offspring of Ancient Hellenism.
  9. The case of Modern Greece and its “Westernization” is a very interesting but separate issue. I will say only this: To the extent that it is Christianized, like the rest of Europe, Modern Greece has lost its ancient potency for autonomous philosophic activity. In the emerging United Europe, in which tiny Greece is supposedly an equal partner, there is a real danger for Greeks to lose their cultural and ethnic identity. Most tragic of all, they may also lose the beautiful language which they have inherited from Homer and Plato, and have preserved even during the long and dark period of Turkocracy. This is a nightmare for the few intellectually and culturally awakened Greeks. They will have to work diligently to prevent such disastrous outcome. We wish them a lot of good luck.

10. In their aggressive proselytism, in their utopian but dangerous universalism, and in their exclusive claim to the "only way" of salvation, by faith in the Bible or in the Koran respectively, Christianity and Islam, as organized religious theocracies, differ from Judaism from which both of them derived, and with which they share the monomania of monotheism and the myth of "the elect people" on a popular level. In the case of Judaism, the folly of this monopoly of God, was rather innocent being national and politically powerless; while in the other two cases, it was not innocent at all because it became supranational and soon acquired political power to the detriment of philosophy and free inquiry.
11. To avoid confusion I should explain that by "philosophy" I will mean in this discussion all the so-called philosophical productions of the Christianized and Islamized Western or Eastern world whether by systematic or edifying thinkers to use R. Rorty's distinction. Rorty also uses "philosophy" to indicate "something on the other side of the tradition." *Philosophy and the Mirror of Nature* (Princeton, N.J.: Princeton University Press, 1979), p. 394. According to Rorty, the "tradition" is supposed to extend from Plato to Nietzsche, while on "the other side" he places such thinkers as Wittgenstein, Heidegger, and Dewey (Chapter VIII, "Philosophy without Mirrors," pp. 357-394). This is a rather curious division in light of the historical facts and the gulf which separates the mentality of the Christian West and its monotheistic religion from Ancient Hellas and its humanistic philosophy. Rorty's division may serve only what he calls "neo-pragmatism" which looks like a new name for the old art of the Sophist. In this light, his project becomes virtually indistinguishable from that other major misfortune of post-modern Western European, deconstructionism.
12. For more on this point, see my "Ancient Hellenic Philosophy and the African Connection," *Skeptis* IV (1994): 4-67.
13. See on this my *Aristotle's Categories and Porphyry, Philosophia Antiqua* vol. 48 (Leiden: E.J. Brill, 1988), pp. 165-181. In a serious sense, the last three centuries of the Roman Empire, before its division into Eastern and Western and the collapse of the latter, can be seen as a "civil war" among Hellenic and Hellenized intellectuals and political leaders, who were split into two parties: those who wished to Hellenize the Latin segment of the population and, thus, revitalize the whole Roman Empire; and the others who wanted to Christianize it first and Hellenize it later, by moving its center towards the East. Plotinus, Porphyry, and Julian belong to the former party. Constantine, Eusebius, and Athanasius belong to latter party which won to the detriment of Hellenic philosophy.
14. The schism is still holding today in spite of all the efforts of unification by both parties which have invariably failed.
15. Ironically, Greece at that time was under the heavy yoke of the Ottoman Turks. She did not manage to liberate herself until the wars of independence in 1821-1922, which ended with a holocaust: the killing, expulsion and dispersion of more than one million Greeks from their Ionian homes in Asia Minor where Hellenic philosophy and Homeric poetry were born and thrived millennia ago. Since Asia Minor unfortunately did not become a part of Modern Greece, a revival of Hellenic philosophy in its birth place has been thwarted no less there than in Europe. This is tragic.
16. What an audacity, what a fraud, one may be inclined to think. Yet, the trick seems to have worked well for the Europeans. For multiculturalists who rebel against Eurocentrism, perhaps out of ignorance, tend to include the Hellenic philosophers in the same category as the European imperialists, which is unfortunate and unfair. It should be corrected and the sooner the better for them.
17. It is even worse than the monopoly of God as claimed by the European Christian and the Asian Islamic versions of Judaic monotheism.
18. This could be a valuable and needed lesson for the fanatical fundamentalists whether Muslims, Jews or Christians who, in the dawning of the third millennium, are about to exterminate each other in the name of the One and only true God, as in Bosnia, Palestine, and Chechnya. What a pity! What a shame! What a degradation of humanity! But this is only the prelude of what may be coming in Eastern Europe, Central Asia, and Northern Africa. For its origins, see my "Porphyry's Criticism of Christianity and the Problem of Augustine's Platonism," *Dionysius* XIII (1989): 51-70.
19. The opening lines of Aristotle's *Metaphysics* tell us that: "All human beings by their nature desire to know".
20. In this light, it would seem that the natural fanaticism, which has historically characterized the dogmatically monotheistic religions of Christianity and Islam, will be revived with greater force now. Since the common threat of atheist communism, which had kept them quiet for a while, has been removed, these two old rivals will ready themselves to battle again over the foolish question of which of them has the most exclusive revelation of the saving truth as the only and truly "Chosen people" of the one true God. Judaism, as usual, would not be able to resist the temptation of playing the one fool against the other, and of signing with the victorious party at the end of the bloody day. To prevent such an outrageous outcome, humanity will need all the help it can get from everyone, including genuine Hellenic philosophy and its enlightening power. Hence the problematic and the urgency of my present thesis.

21. In *The Republic*, Book VI, the genuine philosopher is described and distinguished from both the Sophists and the politicians of that time. Post-modern "philosophers" should consider it again.
22. The Platonic Stranger describes the Sophist in *Sophist* 268b-d.
23. In this sense, every healthy and normal human being, by its very nature and its potential, can become a lover of excellence depending on specific natural endowment, cultural environment, and above all, appropriate *paideia*, as Aristotle clearly noted in *Politics* 1332a 39 b 10.
24. "Now virtue also is differentiated in correspondence with this division of the soul. Some forms of virtue are called intellectual virtues, others moral virtues. Wisdom or Intelligence and Prudence are intellectual, Liberality and Temperance are moral virtues." NE 1103a 4-7 (H. Rackham's translation and capitalization of virtues).
25. When, for convenience, I use "he," the disjunctive "he or she" is understood here. As on the issue of erotic sexuality, so on the issue of generic equality, the Hellenic Democracies were more open minded and tolerant than the Christian and the Islamic Theocracies. From the Madinean Diotima to the Alexandrian Hypatia, many female philosophers flourished in the land of Hellas, especially in the Pythagorean tradition. I doubt that such a phenomenon could have appeared in the Theocratic West or in the Theocratic East during the Middle Ages or even in Modern times. Post-modernity is a different case, but it is too soon for us to be able to foresee its future and to foretell its fortune philosophically or otherwise.
26. Both during his short life on earth and, especially, after his death, when his wisdom would perhaps gain a sort of immortality by being present in the minds of other philosophers and other mortals as Socrates argues in the *Symposium*. See my "Eros and Immortality in the *Symposium* of Plato," *Diotima* XIV (1985): 200-211.
27. Or, one may add, the Ancient Indian and the Ancient Chinese philosophers whose speculations were free from theocratic dogmas in ways in which no Western "philosophers" could have been until now. What will happen in the future time will tell. We can only hope for the better, if not in old Europe, at least in the young America.
28. Once again, I would like to make it clear that I am talking about Lady Philosophy here. The arts are a different story. Many artists can be commissioned to produce works of art which are masterpieces. Philosophy, as the queen of arts and sciences, needs its freedom, its absolute freedom, for she accepts no masters other than reason to guide her pursuits. With God and the Gods, she is always in good terms, if she is of the genuine and gentle kind. For Plato and Aristotle, the genuine philosopher is always *Theophilus*.

29. In my view, this was the core of the conflict, which developed between Hellenic and Christian Platonism, as typified by Porphyry and Augustine. See my "Porphyry's Criticism of Christianity and the Problem of Augustine's Platonism," *Dionysius* XIII (1989): 51-70.
30. The prevailing climate, religious, political, intellectual and so forth, was not conducive to the growth of the spirit of Hellenic philosophy in the West and the North, because such a spirit is in need of bright light, free air, unclouded skies, religious tolerance, democratic institutions, and much more.
31. I emphasize the adverbial "philosophically" to contrast it with the "scientifically" and "artistically" which are different cases lying outside of our strictly limited concern with "philosophy."
32. This came at the critical time after Constantinople, the capital of the Christian Eastern or Byzantine Empire had fallen to the Turks in 1453. This tragedy cut short the process of Hellenic revival which had begun with Pletho and his friends at Mistra.
33. The difference was that Protestantism replaced Catholicism this time, and that Hegel seriously assumed the role of Thomas Aquinas. See, for instance, *Hegel's Lectures on the Philosophy of Religion*, P.C. Hodgson, ed., (Berkeley, CA: University of California Press, 1988), Part III, which is titled: "The Consummate Religion."
34. In this light, the verdict of E. Gilson, *op. cit.*, seems perfectly justified. But the conclusions which he draws from this historical fact are very different than mine. He wants to silence those historians of "Western philosophy" who have raised doubt whether there was any philosophy in the Middle Ages. He claims that, given the dependence of Modern European philosophy (from Descartes to Leibniz, Kant, and so on) on the Medieval Christian theology, it is unfair to apply the glorious name of "philosophy" only to the former and not to the latter. The truth of the matter is that, precisely because of that affinity, neither Medieval Theology nor European "Philosophy" deserve the mane of *philosophia* in the same sense as the Ancient Hellenic philosophers used this beautiful word. To make public this simple but forgotten truth has been the purpose of my present thesis.
35. For more on this theme see my book *The Hellenic Philosophy: Between Europe, Asia and Africa* (Binghamton University, SUNY: Binghamton, 1997) in which a longer version of the paper has been incorporated.

## PREFACE

R. Baine Harris

All philosophers are children of their age and primarily speak to the intellectual needs of their constituencies, but the really great ones somehow manage to transcend their own time. They think more deeply and provide a more profound analysis of the issues and produce a new, richer, and more consistent synthesis of their thought than do lesser philosophers. They break the bounds of the concerns of their day by focusing upon those perennial questions that people in all cultures ask when they philosophize, questions such as 'What is really real?', 'What is the true nature of man?', 'How do we know and how do we know we know?', 'Will we survive our death?', 'Is there a divine source of the world, and if so, how are we related to it?' 'What responsibilities do we have to ourselves, to the earth, and to all the social groups that live on it?', and similar questions. On the basis of his responses to all of these questions Plotinus, an Egyptian who taught philosophy in Rome in the middle of the Third Century AD, certainly qualifies as a great philosopher, and has been so regarded by major thinkers in the West in various centuries since his time, including some in our own century.

Rome in the middle of the Third Century AD was a place that had an intellectual milieu quite similar to the one in our time. By then Rome itself had been intellectually invaded by the cultures of those countries her armies had invaded during the past six centuries. Old established ideas and customs were being challenged by new ways of thinking. There was such a profusion of them that there was considerable confusion among both the general public and the philosophers concerning what ought to be believed. A parallel situation exists in our time in most every country of the world. Old established cultures are being challenged by the intrusion of new ideas brought in by numerous visitors to their shores, and from foreign radio, movies, television and the Internet. Just as in Third Century Rome there is now much confusion concerning what ought to be believed.

Like Confucius, Plotinus thought of himself as only a conservative and a traditionalist who sought to speak to the intellectual disorder of his time by appealing to the unified thought of certain earlier philosophers. More specifically, he thought of himself as a Platonist who sought to bring the unified philosophy of a Greek philosopher who had lived in Athens six

centuries earlier to bear upon the intellectual issues that were then facing Roman culture. Thus, in his old age and after many years of teaching and thinking, he synthesized a new version of Platonism, which he presented in his lectures in his academy in Rome. He only wrote one small book. Actually, he did not write the book himself, but allowed a colleague of his, Porphyry, to take down notes from his lectures and arrange them into a series of essays in nine divisions with six essays each, a work which later became known as the *Enneads*, or "the Nines."

Whether or not his version of Platonism is "true Platonism" is an issue that is still being debated by contemporary Platonic scholars; but it was the version that came to have the most historical importance in the West. His version is old in the sense that it follows the basic assertions of Plato, but new in the sense that it takes into consideration Aristotle's criticisms of Plato and makes some adjustments for them in a more logically organized consistent system of thought, similar in style to Aristotle's way of philosophizing. Thus, he actually produced an Aristotelianized version of Platonism or Platonized version of Aristotelianism, so much so that German scholars in the late Nineteenth Century dubbed him and his imitators in later centuries as "Neoplatonists." Regardless of what he is now labeled, Plotinus would likely have not thought of himself as a new Platonist but merely as an old one who merely formulated Platonism into a more organized consistent form.

The term "neoplatonist," however, needs some further consideration. None of the later Neoplatonists, including all of the teachers associated with him in his academy, chose to accept Plotinus' metaphysical system exactly as he presented it. Even his "Boswell," Porphyry, his editor, promoter, and biographer, in his own version of Neoplatonism denied five of Plotinus' logical categories and substituted five of Aristotle's categories in their place, and thus produced another version of Neoplatonism that for many centuries was more influential than the version given in the *Enneads*. Although all his followers may be loosely called "Neoplatonists," some of them, and especially the teachers then associated with him, simply made their own versions of Platonism, versions that are similar to his, while others of them, especially in later centuries, revised his system with major emendations. Still others accepted only certain parts of his epistemology, metaphysics, psychology, etc. mixing new ideas and new reformulations with it. The latter raises the question how much of the thought of Plotinus must be incorporated into a new formulation of it in order for it to be labeled "Neoplatonic."

Thus, we must conclude that the term "Neoplatonist" does not have a very exact meaning. In the strictest sense, there probably has never been another pure Plotinian since Plotinus; but, nevertheless, elements of his thought, and even new versions of his metaphysics, have appeared in various degrees in the thought of various philosophers, theologians, artists, and poets in various venues in the West in various centuries since he first formulated it in Rome. In addition, philosophical formulations similar to his have appeared in the thought of certain philosophers in India, both before and after the Third Century, AD. Although these have not been historically labeled as Neoplatonic, some of them have a remarkable affinity with his views. To the writer's knowledge, there have been no efforts to make a new reformulation of his metaphysics in modern times, but his influence has been much greater than it might at first appear to be due to elements of his thought that have been embedded in the thought of other writers and scholars who are still widely read. Numerous Christian, Jewish, Islamic, and "pagan" philosophers, theologians, artists, and poets throughout the centuries of Western Intellectual History have gone to his *Enneads* almost cafeteria style and picked out certain elements of them to be reused in their own new formulations. In this way he has actually been one of the most influential of all the Roman thinkers who helped to shape what we now term "Western Civilization."

This explanation is relevant to ■ consideration of the nature of the forty essays in the two volumes of this book. Most of them were first given in an earlier form at ■ four day international congress of the International Society for Neoplatonic Studies held in Vanderbilt University in Nashville, Tennessee held in May of 1995, with some 130 scholars in attendance. The purpose of the conference was to illustrate that some elements of the thought of Plotinus survived to be of some importance in the Twentieth Century and may be viable for the future. As its name suggests, this society is a society for the *study* of Neoplatonism rather than a fellowship of Neoplatonic believers, and as such, includes members who vary in their degree of academic involvement in the subject. For some it is their primary field for teaching and research, while others are interested in it only as it may be related to some other major concern. In like manner, its members also vary in the degree to which they sanction Neoplatonism as a philosophy. Some see it as an important element in understanding the history of Western Thought, but judge it to have only antiquarian value, while others see some elements of it to be quite viable for modern times. The various essays in these two volumes reflect the same sentiments. They are not so much apologies for Neoplatonism as they are evaluations

of it, both as a historical phenomenon, and as a philosophy and a way of philosophizing that still can speak to the intellectual needs of modern man. Included among them are essays by some of the major recent noted authorities on Neoplatonism, including those by John Anton, Leo Sweeney, A.H. Armstrong, Werner Beierwaltes, and John N. Findlay. Part One contains essays that relate Neoplatonism in some way to Contemporary Science and Contemporary Philosophy while those in Part Two relate it to Contemporary Social Theory, Contemporary Aesthetics, and Contemporary Spirituality.

Finally, as editor I wish to express my appreciation to Professor John Lachs, Director for the Center for Neoplatonic Studies at Vanderbilt University for hosting and co-directing the 1995 ISNS conference and for the scores of persons, ISNS members and otherwise, involved in the production of this book.

Old Dominion University

## ACKNOWLEDGEMENTS

Appreciation is expressed to Dr. Patrick Drinan, Dean of the College of Arts and Sciences of the University of San Diego for arranging for the production of the final camera ready copy of these two volumes, and to Vivian Holland of its manuscript production staff for turning the manuscripts into book form. Kudos also go to Dr. Michael Wagner, Professor of Philosophy of the University of San Diego for managing the entire project and for serving as copy editor.

# Hierarchies, Cultural Institutions and the Problem of Democracy: A Neoplatonic Critique<sup>1</sup>

John P. Anton

## I. The Concept of Hierarchy

The concept of hierarchies, whether of beings or of values, of institutions or social standing, is as old as human culture. The word "hierarchy" is used here not in its original meaning of "leading sacred acts" of theurgy in late Hellenistic culture. It has now become acceptable practice to use the term metaphorically to cover any systematic ranking of institutionalized practices, values, concepts, ideas, performances, offices, as well as cosmic entities. As a result, the metaphor has made possible usages way beyond the initial meaning of the Greek verb *ἱεραρχεῖν* and the noun *ἱεράρχης*, and the term itself has acquired such breadth as to cover not only what Plato and Plotinus called *ἀναβαθμοί*, steps in an ascending order, and also a great variety of types of grading in ascending order.

I should like to add a note of explanation concerning the expression "neoplatonic critique." It refers mainly to the critical examination of a hierarchical model. The model itself can be traced back to the Neoplatonists of antiquity who used it to support their ontologies. Aside from propounding a doctrine of a hierarchy of being, their model required the formulation of criteria for the justification of the doctrine. In this paper the issue I raise is not about the practice of hierarchical gradings but whether the implicit model contains the requisite criteria for the justification of the arranged values and entities. Given that hierarchical arrangements are inescapable, the concept of criteria is as a matter of rule easily ignored. Hence the need to re-introduce the requirement of justification on the basis of explicit criteria.

The overt and covert employment of hierarchical schemata without explicit criteria of justification is as much a source of logical difficulties as it provides a way to evade exhibiting the basis of acting on projected priorities, be they social or personal. The criticism that the neoplatonic model recommends calls for exposing the dangers that attend the adoption of hierarchies without justification open to public inspection. As I will try to show, a host of difficulties are allowed to remain unattended in the fabric of contemporary democracies due to unexamined grading of values and institutions. Such hierarchies have nothing in common with the tradition for which the Great Chain of Being once stood.<sup>2</sup> Whereas the ancients, especially the Hellenistic Platonists made use of explicit principles on which to base their speculative systems of priorities, the moderns, after the demise of the *scala natura* in the eighteenth century, moved away from using comparable principles of descending ontic orders or ascending ethical ones.

There is no denying the fact that preferences leading to priorities occur spontaneously. Certain objects and feelings for a great variety of reasons are recognized and pursued as being more beneficial and satisfying than others. Preferential conduct is inescapable though not the projected and adopted hierarchical patterns of approved values. The institutionalization of such patterns, in support of whatever causes, creates situations of injustice. Of the many devices that have been introduced from time to time to redress cases of social inequities none proved more effective than the appeal to the principle of equality. As such, however, this principle of justice is a later development in the history of social conduct, an afterthought as it were, and has stood in opposition to what hierarchical priorities establish as norms.

As a principle, equality has limited efficacy in that it serves mainly as a corrective and preventive mechanism, not one that can be unconditionally legislated to remove all existing and future hierarchies of preferential patterns of either individual or social conduct. For to force equality sweepingly to apply to every mode of priorities would inevitably throw into disarray the principle of freedom, if not cause it to be temporarily canceled. Equality finds its best application in situations of flagrant abuses of privilege by persons or institutions who wield power. The purpose of equality as a tool, next to its corrective role, is to prevent the imposition of new social hierarchies and the removal of old ones once they have

become causes of injustice. But to say that equality is a panacea for the intrusion of hierarchies into the social, political and cultural fabric, is simply a utopian expectation. The problem here is not with the clash between equality and freedom but with the hierarchical orders that become orthodoxies and prevail without accountability.

When Plato proposed and defended the rational faculty as the foundation of a new system of education, he evoked a tradition already in place but in need of completion. The time had come for the direct challenge of competing hierarchies or established modes of ordering values. The proposal was made in the name of justice, individual and political. The building of the new *politeia* demanded the close cooperation of all skilled people, workers, poets, philosophers, and statesmen. The competing views of justice we see in the opening book of the *Republic* make it clear that everyone present was fully aware why the resistance of the operating hierarchies was expected to be fierce. It still is. This is a perennial problem of reforms and is present in all social and political organizations; it is a problem for all cultures and all seasons. As Plato would say, it is the animal resistance of the appetitive systems of hierarchies to the principle of rational excellence, to the practical and theoretical efficacy of the rational powers that call for a new mode of education. A new set of excellences is needed to re-orient the psychic priorities and to instruct the body politic in the conscious acceptance of the criteria that reason introduces for the evaluation of hierarchical reforms.

We may now want to ask a comparable question. What is the relation of the ubiquitous presence of hierarchies to the quest for *isonomia* to challenge the hierarchies of power, wealth, position, inheritance and other agents in democratic societies? Whenever the presence of hierarchies in the social structure frustrates the pursuit of reforms to effect a reasonable distribution of privilege, there emerges an unavoidable tension between inequalities due to hierarchical arrangements and needed reforms to serve equality as the principle of justice.

## II. The Problem of Democracy

In monarchical and theocratic states the tension between freedom and equality is hardly an issue that may threaten the stability of their standard institutions. However, such is not the case in democratic societies in which the commitment to the principles of equality and freedom is stated in the form of constitutional rights. Yet the unequal distribution of power and the intrusion of countervailing priorities create the paradoxical situation of conflicting hierarchies of values not only between different persons but also between persons and institutions. The question that is often left unanswered is the extent to which citizens in democratic societies are willing or prepared to correlate the constitutional guaranteed equality and the imposed institutional hierarchies, when the latter impinge on personal priorities and demand the subordination of the latter to the former. The privilege to invoke logical criteria to effect a balance between the two patterns of hierarchical values has become increasingly difficult to exercise. Conciliation between conflicting patterns of multiple hierarchies on the basis of uniform logical criteria is a rather rare phenomenon. Reforming wavering democracies to turn them into rational societies of balanced institutions in accordance with the principle of equality, has always been a difficult undertaking. The same holds in the case of stable democracies still in need of ameliorative changes once the interests of the most powerful institutions continue to reign at the expense of others. Whatever the intensity of trends may be in cases such as the one just described, the question about the extent to which the principle of equality in democracies is being observed must always be raised.

The principle of equality, of *isonomia* before the law, does not work in practice in the case of institutions. Here hierarchies prevail usually by complying to the rankings of special objectives while rendering consistency with the values of other institutions marginal. Needs, not logical criteria, dictate the prioritizing of institutions in the most developed forms of democratic states. As expected, the result is that no functional unifying principle of reason becomes readily available to justify the vertical ordering of institutions, just as there is no explicit concept on which to build a universally acceptable and coherent vertical order in the hierarchy of personal values. Each person naturally arranges his/her value priorities,

through desire, habit, including the responses to externally imposed responsibilities. Still, there is no absolute rule by means of which one can be held prisoner to some unalterable vertical order of values throughout one's life in the face of changing conditions. Clinging to an authentic "meaning of life" that is also unconditionally valid, one that may in turn serve as the criterion of correct hierarchical orders for all human beings everywhere and for all times, has been an elusive goal. In the face of so radical a relativism, what, we may ask, could a "neoplatonic critique" mean in the context of a pluralistic view of democratic freedom? Unless a unifying principle of coherence can be found to harmonize the variety of personal and social hierarchies, relativism deserves to be given free reign and recognized as the ruling authority of conduct.

Let us consider the case of religion as a candidate to provide a unifying and ordering principle. Its function would be to give coherence to institutions and persons by removing actual and conceivable conflicts. Religion at certain periods in history, including our own, as K. Mannheim has argued, functioned as "a social control inspiring patterns of behavior and ideals of the good life." The gradual withdrawal of religion as a dominant institution in Western culture and political history with the advent of the Renaissance, made it possible for other agents, such as industry, commerce, education, art and science, to follow a path of their own. With the withering of feudalism, modern types of government, kingship, democracy, fascism, communism filled the vacuum. They in turn acted to re-arrange human activities in a manner that best suited their ends, subjecting the social components to new sorts of hierarchical order. Whatever the character of the new special orders, it was founded on some hierarchical principle that either implicitly or overtly functioned as the unifying force to provide the desired organizational model.

Consider a negative circumstance where a philosophical proposal of order did not and obviously could not receive support from the political and legal forces. I have in mind the modern philosophies of art that espoused a hierarchy of the arts. No matter how well argued, their social efficacy was kept at a minimum. There is no need to elaborate on how complicated the classification of the arts became in modern times and how the philosophies of art came to propose novel hierarchies in the domain of aesthetic values, what since the eighteenth century, after the writings of

Addison and Gerard, are known as aesthetic categories. A quick comment on Hegel's contribution will suffice. While he thinks of art as the sensuous presentation of the Idea in the course of his panlogical idealism and denies any dichotomy in the world, still it is reason, including art as reason, that renders intelligible the march of the Absolute or God. The place art occupies in the unfolding of the Absolute as Idea determines the order of art and the orders within it. There is double hierarchy here: one of the absolute mind in art as thesis, religion as the antithesis and philosophy as the synthesis, and another order within art, the symbolic as thesis (architecture); the classical as antithesis (sculpture); and the romantic as synthesis, within which painting is the thesis, music the antithesis and poetry the synthesis.

The classification of the arts, actually a hierarchy, is done on the basis of the degree to which they express or become means for the self-realization of the Absolute Idea in its evolution to become Absolute Spirit. Whether we stay with Hegel's or Schopenhauer's views of the arts as the timeless objectifications of the Will, or any later conception of the hierarchy of the arts, the question is not about the soundness of the modern aesthetic theories but their potential role to lead and provide the principle of institutional balance. No concrete proposals proved derivable from aesthetic theories for political justice in democratic states. One can not even work out from a study of Hegel a feasible plan to legislate support for an institute of the arts without meeting with resistance from other powerful value centers. The impractical character of such a move is too obvious for comment. Yet we still have to view the broader problem of cultural justice, including the arts, in the context of political theory and the adequacy of a unifying principle capable of effecting equality and institutional justice.

### III. Hierarchies and Freedom

An essential feature of personal freedom is the right to form one's own hierarchies of values under the protection of the law. Still, the interference of authorities to limit or even suspend the exercise of this feature of freedom is hardly confined to non-democratic forms of government. We must admit that freedom-seeking citizens exist and feel suppressed not only in the political

climate of dictatorships but also in every constitutional form when authoritarian rule tends to control value gradations without the full consent of the public. The worst enemies of democracy, its principles, methods, concepts of institutional equilibrium and cultural open-mindedness, are not necessarily confined to the policies of non-democratic states. In their case, opposition and resistance rise more readily, but the groups and individuals who undermine democracy as a matter of rule are constituents within it. Aristotle pointed out long time ago how the decline from within must be feared at least as much, if not more, as the danger of external aggression. Protecting democracy from within is the major problem of Western culture today. Research into the prospect of political deterioration is more urgent than research into other fields of inquiry, if only because ultimately the preservation of democracy depends on information made public to maintain alertness to the conditions that secure the unimpeded practice of all inquiries.

In recent times we seem to be so preoccupied and bedazzled by our specialized research that the broader context of research either escapes our attention or is taken for granted. The consequence of complacency is that democracy continues its course in an anomalous pattern of institutional interrelationships while the public loses sight of the confusions that the unchecked hierarchical stratifications of its institutions generate. It is small wonder then that clusters of common values in our culture are often driven to underprivileged positions. And once this is done, we are at a loss to understand why the defenders of differently prioritized values demand equal status with those at the top of the pyramid of power. Such is the case, for example, of the artistic activity when compared to the status that religion or science enjoy.

When people in a democratically governed state allow certain institutions to struggle for survival while others dictate from a privileged position, hierarchical arrangements eventually cause serious axiological imbalances. Perhaps, in this regard, the political problem in our century is no longer that of capitalism versus labor in the old-fashioned class-struggle pattern. The nineteenth century model of contrary forces has become outmoded due to progressive welfare reforms and social improvements of underprivileged groups. The institutional inequality actually runs in much deeper and subtler ways because it works at a more complex level, not easily detectable. The public inequalities in Western democracies

are more fundamental now because they go beyond the conflict of groups or individuals; they operate at the level of institutions. We have institutions that enjoy the fruits of freedom but at the same time they are hierarchically stratified on the basis of power, controls, efficaciousness and image-forming. The principle of *being*, to speak with philosophy, has been replaced with the principle of *power* in the evaluation and identification of these entities.

The difficulties that institutional inequality creates are readily reflected in the attitudes of the common people who, with or without embarrassment, often find it necessary to apologize for being interested in the so-called impractical studies and professions. But the irony of the thing is that we often find ourselves defending the finer side of culture. Our universities and colleges are already displaying unreasoned preferences siding with the *hoi polloi* and offering no apologies. The ratings of departments, the salaries of teachers, the buildings that house academic specialties, the administrative procedures and decisions, on the whole reflect the same broader institutional inequities.

It is simply amazing that democratically governed states have been driven to the point that their citizens openly view the values of the cultured life or, even worse, the value-making reflective activities, with the same indifference that they accept this hierarchical injustice. A comparable hierarchy of professions, based on power and special services, has emerged without support from any principle of coherence. The powers at the top of the pyramid, even when they reluctantly invite criticism, remain unconvinced and recalcitrant. They reign and rule devoted to perpetuating the hierarchy of cultural institutions without attention to the principle of institutional balance as befits democracy as a way of life. Those who knowingly or passively subscribe to the "unexamined life" or the uncritical acceptance of the imposed hierarchy of values, commit two excesses: (a) they build a prison wall around human nature by confining the development of the possibilities of sensibility through restrictive codes to "approved" priorities of actions; (b) they carefully discourage the reorganization and/or expansion of cultural values. In other words, they oppose the cultivation of alternative hierarchical arrangements. They turn freedom into acceptance of available choices within controlled and sanctioned systems of relations. What this seems to purport, then,

in terms of human character, is an ideology of human work, functions, interests, and a limited use of critical intelligence.

The wholeness of any culture is found in both structure and function, not different from that of the human individual, except in one, albeit very important respect. Individuals are endowed with potentialities that make them distinctive in various ways and capable of decisions and actions exemplifying their own grading of values. However, over and beyond this stratification of hierarchically organized interests, the human individual is a being capable of re-integrating new interests at levels where established hierarchies cannot enter. Thus, any given axiocratic system can be removed and withdrawn in favor of a different one. Let us call this procedure a method of habit substitution. The resulting series of such substitutions form a sequence of horizontal sets organically grouped with some degree of coherence attained at each phase of development by eliminating certain elements or adding others until such time as character is settled and solidified. Transitional phases vary from person to person. What matters mostly is not the fact of serial changes but the freedom to exercise choice from available alternatives.

Whereas a free human individual works simultaneously with vertically arranged preferential schemes as well as horizontally ordered plural interests, an institutional structure cannot perform in both directions. The reason is simple enough: what we call culture is not an organism, a living thing endowed with consciousness and freedom. Culture is called an organism only in a metaphorical sense. Clearly, cultures cannot and do not act, move, think, desire, grow, sleep, rest, change. In view of this fundamental difference between human beings and their culture, once the analogy of the concept of culture to the concept of organism is understood, the question to be asked is: What is an appropriate order for institutions in democratic societies? The answer cannot be that of the inflexibly vertical, i.e. an uncritically imposed hierarchical order, since "culture" is not an entity that can act on its own. Cultures do not resolve and replace entrenched vertical stratifications of constituent institutions, unlike what human beings do as they move actively between the vertical and the horizontal grading priorities. Therefore, the only permissible and theoretically defensible order that is assignable to the plurality of institutions is one that recognizes their integrity and distinctness by placing them on a par.

Essentially, this is what the principle of institutional balance means. Hence, the criterion of cultural health is not how to increase the power and efficient control by one institution but to serve harmony or cultural justice. The correct point of departure of cultural criticism then is to assume the plurality and autonomy of institutional significance and its role to effect mutual enhancement. Given this initial framework of cultural justice to provide for balance and improvement, each institution issues an invitation for cooperative sustenance and support. This is the best meaning of democracy as a progressive program, at once a general opportunity for all citizens and an open frontier for approximating the ideal of social conduct.

Democracy as just cultural pluralism and as a model of equal opportunity, makes the whole of culture available, at least in principle, to all citizens. This is what was meant when I stated that each person is entitled to enjoy fully the values that social cooperation ensures. Hierarchical orders are justified only when universal values become openly accessible to individuals. Any other organization of institutions sooner or later leads to dissolutions, dissociations, divisions and fragmentations. Inevitably, such disruptions turn citizens into estranged and alienated beings, mainly because they are forced to use only inflated segments of themselves and of their culture to compensate for the whole that has lost its cohesion. When this is allowed to happen, one part of the whole preys on the others until all become either atrophic or, at best, some survive parasitically at the expense of the others.

For the wholesome endurance of democratic cultures, their constitutive institutions require not only the atmosphere of relative autonomy but also that of cooperation. This applies to science, politics, economics, and all the others, as well as education, art and religion. Neither individual persons nor given institutions can flourish in isolation or by claiming supremacy. Yet, they often do by resorting to inflated forms of subjectivism. Consider, for instance, what happens when supremacy is claimed for religion or art. Such misdirected significance easily injects disharmony into the whole institutional system, and with disastrous results for the political and legal agencies. Hence the social responsibilities of the artist, for example, once a hierarchy of values is accepted, reside not outside the artist but inside the artist as citizen. The artist as

such is not qualified to do things outside his special work, that is things unrelated to the performance of art. They belong to the exercise that renders artistic work socially important as public goods. The artist's responsibilities flow naturally and constructively from the correlating of the aesthetic attitude to the whole spectrum of common values that define the wholeness of that culture, i.e., the artist as citizen. That is how, I think, personal hierarchies of values can function best. *Mutatis mutandis*, the principle holds equally for the prelate, the scientist, the teacher, the statesman, and all the others who function as participants in an established set of institutions.

#### IV. The Legitimate Limits of Hierarchies

All along I have been talking about two types of hierarchies: institutional and personal. Both are products of the preferential principle of decisions and values. Hierarchical orders occur naturally enough. As orders, however, they present us with a perennial issue. At one level of individual conduct, we have biological needs and their gratifications which by nature seem to fall into gradable orders for survival purposes, depending on the primacy of given needs. At another level we have social and interpersonal needs that call for effecting a different type of enduring stratifications related to the survival of the group, be it nomadic, ethnic, state, or other. There is no definitive pattern that can advocate with absolute certainty the subordination of the personal to the group type of stratified needs and goods other than the elementary necessity to meet survival exigencies. They are the ones that attain the earliest crystallization recognizable as basic common goods.

That personal needs often exceed the permissible limits of common needs is too obvious to require explanation. What is of the essence here is the fact that individual and social orders may and do conflict. At this point the juxtaposing of personal or atomic hierarchies resulting from the ranking of needs and choices, and those of the social, cultural and political hierarchies, grants special urgency to the tension that arises between these two types of ordering of values. Seen in another way, the tension is due to a conflict between subjective and objective or personal and public

arrangements. The latter are always social in character and act as controlling agents demanding the conforming of the subject to the object, which in fact is none other than the set of objectified common needs and ends. Objective hierarchies impose upon the subjective order of values what is recognized as vital to the group, the result being that such imposition eventually takes the form of sacrosanct institutions, indispensable to the welfare of the group.

And now for the problem. Effecting agreements between the two orders by re-aligning the subjective and the objective hierarchies is too vital a task to be unconditionally delegated to legislating authorities, for it conceals a paradox. The needs of the individual cover a wider spectrum of desirable entities than what the survival of the group considers necessary. The picture is actually more complicated. There is another factor that affects the hierarchical orders of the individual and the group: the special interests of influential organizations within given societies and the hierarchies of values they generate. The complexity of orders and conflicts between orders increases considerably, and the problems that must be solved to effect harmonies and conciliations multiply proportionately.

Reforms, whether peaceful or violent, constitute intended answers to the emerging tensions. Many types of solution have been tried and will continue to be tried, although their codification is far from complete to give us a final list of remedies. Let me mention an example. Resorting to religion has been one way of bringing about agreements among conflicting orders of valuing. The mode this type uses is that of commands to be obeyed by submitting to the will of the divine. How acceptance of this way of ranking responses is communicated is another issue and need not concern us at this point. Yet other types of resolving conflicts are legislating through the device of authority invested in elected leaders and that of self-appointed arbiters. The end result is the same: agreement to accept the rule of law. Now, we may ask: what would be the role and what contribution can other institutions, e.g., science or art make, beyond what their primary function allows, inquiry in the case of the former and *techné* in the case of the latter, to effect agreements? It is easy to talk about the social mission of science or art, but difficult to identify the precise way in which either can arbitrate between conflicting hierarchies of broad social objectives and needs.

The conflicts of systems of stratified values is an old story, though not the systematic reflection on this perennial problem and on solutions. I would like to pause at the first great phase of the latter concern, when the authority of an explicit principle was rooted in the appeal to the nature of things. We know enough about this early phase. The great legislators of Greece, Solon, Lykourgos and others, did exactly that: they appealed to what they thought was a principle transcending disagreements. In all cases the appeal was to *logos*, the rational structure of reality. Suffice it to say that this principle was one of the cornerstones of early Greek thought and political conduct. It may not be an exaggeration to say at this point that the culmination of the theoretical search for the principle that warrants the hierarchy of values found its first elegant expression in the doctrines Plato stated in his *Symposium*. Eros and the ladder of the objects of desire are too familiar to need commentary. The hierarchical arrangement of the desirable objects, recommended for personal development and as the ground for the educational system that best prepares the citizens to serve the common good, is stated both as a psychological theory and as an ontological doctrine.

Aristotle's theory of life, expounded in the *De Anima*, and repeated in other works, continues the Platonic search for a principle of order best to guide human activities. He had in fact found the principle in the nature of the human type of life where the hierarchical order of the functions of the *psyche*, already encoded in *entelecheia*, holds the key to the supremacy of the *logikon*, a principle that calls for training of the logical faculties to reign over the *orektikon*, the *threptikon* and the *aisthetikon* parts of the soul. The controlling principle of human *entelecheia* is meant as a scientific *arche* grounded in nature for the stratification of the powers of human beings and of their ethical and political actions that flow from their exercise. Here the *taxis* of all institutions finds its objective justification. It is this central point in Plato's and Aristotle's political reflections that became the ground for the Neoplatonic hierarchy of both Being and Value, of ontology and axiology.

Plotinus' conception of the production of the hypostases of being from the One provided the basis for the hierarchy of being, the ontological order. It also became the foundation for the axiology undergirding the ethical path of the return of the soul to

the One, the spiritual *nostos*, the ontology of the ascending order of ethical and noetic attainments. The One, source and end of both hierarchies, subjective and objective, constitutes the principle from which agreement flows when priorities are polarized and tensions become unhearable.

Going back to Plato and Aristotle, the criteria that test the endurance of agreement between personal and social hierarchies of values are best understood in the context of life in the *polis*, the community and its institutions. In modern times, however, the organization of the state, what the Greeks meant by the idea of the *kratos*, replaced the *polis*. It is not surprising that the criteria of justification have also undergone a radical change along with the meaning of the individual and the right to effect subjective hierarchies. Consider, for instance, the relationship between state and individual in light of constitutions which embody such principles as underscored in the American Declaration of Independence: Life, Liberty and the pursuit of Happiness. The implicit right to a hierarchy of personal values contained in the concept of Happiness is left unspecified if not purposely vague. No principle of objective hierarchical order, other than the preservation of the constitution and the rule of law, is stated. In preserving the conditions of freedom, the task of politics excluded from its objectives the finding of a connective continuity to correlate the subjective and objective hierarchies that inescapably emerge in the transactions of institutional conduct. Add to this the problem of changing orders, due to the dynamics of pressures from other modes of valuing, such as economics, religion, within hierarchies, be they personal and subjective or institutional and objective, and one sees clearly why the educational policies are forced to follow suit. Once the goals of education become infested with the free-floating demands from the more powerful institutions, the ensuing instability of curricula follows, altering the directives for the formation of character.

The fluidity that has attended the goals of education in this century served well the rising interest in commercial production, the professionalization of the teaching enterprise and the increasing dependence of the economy of the leading nations on consumerism. The demeaning of the contribution of the humanities in forming personal hierarchies of value stems from the external hierarchies of the dominant institutions. The burning issue is not whether

education as an institution is honored on the basis of the principle of institutional equality, for clearly it is not, but whether there is in modern times a philosophical enterprise engaged in re-affirming the quest for a principle to secure institutional balance and cultural justice. So far neither ontology nor political action has shown strong interest in asserting, to say nothing about identifying, such a principle to serve as the foundation of hierarchial organizations.

Neoplatonism may not be a doctrine whose revival holds the key to the solution of the problem, but it cannot be denied that it is a way to understand the issues and perplexities of the period in which it appeared. At least this much can be said about its relevance to our times. Neoplatonism deserves special attention as a study of hierarchies, both personal and ontological. As such it is a landmark and a model, offering a theory that gave credence, at least for a while, to the methods of discovering a unifying principle to establish continuities between the subjective and the objective. We have none. And that is something that may be taken either as the blessing of freedom or as a covert curse. In either case it points to a serious flaw in the order of human activities. And now that multiculturalism has emerged as a theory to defend the equality of cultures, though not their continuity, not enough is being said for the need to introduce a principle of cultural justice where disconnected plurality has come to prevail. So far we try to face the problem of multiplicity by rejecting the quest of a unifying principle of hierarchy. Since equality does not figure as a vital issue, the uncritical acceptance of hidden hierarchies is bound to reappear with vengeance. For the time being, we can do no better than to contemplate and nurse our suspicions.

#### NOTES

1. A plenary session paper presented at the Conference on Neoplatonism and Contemporary Thought, sponsored by Vanderbilt University, May 25-28, 1995.
2. See A.J. Lovejoy, *The Great Chain of Being*, (Harvard University Press, 1948). He uses the term 'hierarchy' with reference to Aristotle's "hierarchical arrangement of all organisms, which was destined to a greater influence upon subsequent philosophy and natural history" (58). He further notes how "the conception of the plan and structure of

the world which, through the Middle Ages and down to the late eighteenth century, many philosophers, most men of science, and, indeed, most educated men, were to accept without question—the conception of the universe as a ‘Great Chain of Being,’ composed of an immense or...of an infinite number of links ranging in hierarchical order from the meagerest kind of existents...through ‘every possible’ grade up to the *ens perfectissimum*” (59).

## Porphyry’s Concept of *Ablabeia* and the Issue of Animal Rights

Michael Hornum

When Justinian closed the Academy in Athens, a millennium long tradition of debate concerning the ethics of killing animals and other nonhumans for food was suspended. Advocates of philosophical vegetarianism had included Pythagoras, Empedokles, Theophrastus, Plutarch, and Porphyry. Plato, too, has been shown by Daniel Dombrowski to have possessed a positive estimation of the vegetarian life.<sup>1</sup> The closure of the debate in Late Antiquity is clearly rooted in the attitude of the newly dominant Christian intellectual milieu. It was now held that God himself had shown the killing of animals and plants for consumption not to be in itself a wrongful act, but only in its effects; for example, if such food inclines one to gluttony or causes divisiveness within the church. This perspective is typified by the comments of St. Augustine in *On the Catholic and Manichaean Ways of Life*:

Christ himself shows that to refrain from the killing of animals and the destroying of plants is the height of superstition, for, judging that there are no common rights between us and the beasts and trees, he sent the devils into a herd of swine and with a curse withered the tree on which he found no fruit.

It has only been during the present century that debate concerning the extension of human moral concern to include nonhumans has again gained wide currency. Most of the present debate revolves around the question of the post-Enlightenment issue of rights. Two of the most powerful contemporary arguments in favor of “animal rights” are those of the philosophers Tom Regan and Bernard Rollin.

Tom Regan’s position is grounded in a Kantian approach.<sup>2</sup> Kant had contended that human beings were entitled to moral treatment because they could never be reduced to means to an end, but were

always ends in themselves, possessing an inherent worth. Regan argues that at least certain animals, particularly mammals, must also be considered as having inherent value. He criticizes Kant and other philosophers who have made the criteria for inherent value rest upon language, rationality or other traits that seem to exclude nonhumans. In place of what he perceives as purely arbitrary categories, he posits the notion of "subject-of-a-life" as the criterion for establishing inherent worth. Individuals are considered subjects-of-a-life if they have a capacity to experience pleasure and pain, possess emotions, have a sense of perception and memory, are able to intentionally initiate an action to satisfy their desires and goals, have beliefs, have a sense of their own future, and possess a welfare in the sense that they fare well or ill during the course of their lives. Such individuals, whether they be moral agents or moral patients, are ends in themselves.

After having attempted to demonstrate that nonhuman mammals, at least, possess the characteristics of subjects-of-a-life, Regan suggests that human actions regarding those animal individuals should be undertaken in a way that respects their inherent value. Because of their inherent worth, these animals have a right to respectful treatment. Under Regan's position, humans have a moral duty to seek to avoid killing other mammals for food, or any other purposes, because these animals possess an inherent worth comparable with that possessed by humans. Only in cases where such killing is necessary to preserve human life does Regan's ethic permit a weighing of human and nonhuman rights on the basis of the "worse-off principle," namely that whichever creature will experience a greater loss in its death will be preserved. Regan is unclear regarding our duties towards animals that do not appear to fit the subject-of-a-life criterion.

Bernard Rollin takes a similar, although more inclusive, approach to the issue.<sup>4</sup> He asserts that each living creature possesses a telos or certain intrinsic activities and needs that it seeks to fulfill. Certain needs can be classified as interests in the sense that they matter to the creature. Of course, in order for needs to become interests, the creature must have some degree of awareness or consciousness, no matter how simple. Rollin, a biologist, attempts to demonstrate that even the least complex animals, such as invertebrates, appear to possess a sufficient degree of awareness to have interests. Because animals possess interests, Rollin argues that

they have the right to seek to fulfill those needs that matter to them, and above all the right to life, because life is the basic prerequisite to satisfying all of those needs. Rollin excludes plants from moral consideration because they do not appear to have interests, and therefore lack rights. Rollin does not offer a general principle, like the "worse-off principle," under which one can resolve conflicts between rights of humans and nonhumans, but suggests that each instance must be considered on a case by case basis.

There are two major problems with the rights approach to moral consideration for animals. First is the concept of moral rights in itself. This notion is largely predicated upon the assumption that one or several inherent characteristics of humans and/or nonhumans bears a value that demands absolute respect, and should not be subject to whims of might or circumstance; for example, the rights to "life, liberty, and the pursuit of happiness" guaranteed all American citizens. This idea of natural or inalienable rights ultimately stems from the concept of Natural Law, a higher law written into the world by the Creator, and to which all human laws must ultimately conform. However, the ideas of Natural Law and inalienable rights are subjects of a great deal of debate.

Many Utilitarian philosophers and others have attacked these notions as nothing but unproven assumptions.<sup>5</sup> Perhaps one might find these ideas more plausible if natural rights were merely the equivalent of biological needs, although, even here, it is difficult to see why a need necessarily implies a right. Most natural rights theorists, however, do not so regard inalienable rights, but connect them with interests rather than needs. To do so inevitably brings the problem of how we can know another's interests without being required to merely speculate based upon our own feelings and goals. Certainly, others can communicate what appear to be their interests to us, but can we really get inside another's mind in order to make sure that we are not being deceived? By stepping into this controversy, the rights approach must attempt to satisfy such objections before even beginning to embark upon a defense of the creatures whose rights it seeks to protect.

Once embarking upon that defense, the rights approach to moral consideration of nonhumans encounters its second problem. In order to give animals moral consideration we must discern in them qualities sufficient to demand moral treatment. The rights approach forces the philosopher to demonstrate that nonhumans have

consciousness, intentionality, beliefs, desires, or other qualities sufficient to constitute the foundation for having interests or being subjects-of-a-life. To do this, the philosopher must not only study intensively all relevant scientific data, assuming that the scientific method can access the inner life of either nonhumans or humans, and must assiduously eschew anthropomorphizing nonhuman behavior. This is no mean task. It is difficult enough to peer into the inner life of even our most intimate human companions, let alone penetrate into the minds of nonhumans. The rights approach creates a daunting burden of proof for the philosophical advocate of vegetarianism.

In the remainder of this essay, I shall endeavor to explain Porphyry's Neoplatonic approach to this issue, and show how it can establish a foundation for a less burdensome argument in support of vegetarianism and other moral concerns related to animals and even plants. Porphyry, like his teacher Plotinus and many of his Neoplatonic contemporaries, had ceased to consume animal flesh when adopting the philosophical *bios*. Plotinus, Porphyry tells us, even avoided medicines containing animal products.<sup>6</sup> Porphyry is one of only two ancient Greek philosophers, of whom we are aware, who composed tracts specifically designed to support a vegetarian lifestyle; the other being Plutarch in his "Of Eating the Flesh."<sup>7</sup> Porphyry's *De abstinentia* was composed as an exhortation to a fellow pupil of Plotinus, Firmus Castrius, to return to the vegetarianism that he had abandoned.<sup>8</sup>

Porphyry's argument is presented in four sections. Each section relates to a different topic of philosophical concern: purity and moderation, piety, justice, and cultural acceptance. Porphyry attempts to convince Castrius that a philosopher's purity, piety and justice require his adoption of a vegetarian diet. In each of these first three sections, Porphyry offers refutation of many of the philosophical arguments presented by opponents of vegetarianism, particularly the Stoics and Claudius of Naples, a first century rhetorician. In the final section, in order to counter the argument that such a diet runs counter to normal human behavior, he shows how widespread vegetarianism has been in the past and how common it is among the wisest people of other cultures. Worth noting as well is Porphyry's attack on animal sacrifice in the second section, which constitutes a rare example of ancient intellectual

critique of the practice and contrasts sharply with the favorable view of the practice among many later Neoplatonists.

Porphyry's arguments at times intersect those of modern proponents of animal rights. For example, he devotes a large portion of the third book to enumerating examples of animal language and reason in order to establish a closer alliance of man and beast than many ancient philosophers were ready to accept. For, as Porphyry says, "he who admits that he is allied to all animals, will not injure any animal" (III.26). In addition, as Daniel Dombrowski has pointed out, Porphyry is the first philosopher to use the now popular "argument from marginal cases," namely, that exclusion of animals from moral concern based upon reason or language, as is so often done, also requires us to exclude many humans, including infants and the mentally enfeebled.<sup>9</sup>

However, despite these similarities with the modern rights approach, the overall thrust of Porphyry's argument is quite different. While it is true that Porphyry does show consideration for the nature of nonhumans and their suffering, these concerns are subordinate to the pursuit of human perfection. His perspective is not that animals have certain rights that we must respect, but that the goal of human life cannot be achieved if we harm nonhumans. His approach is what I will characterize the *ablabeia* or harmlessness approach.

Like Plotinus, Porphyry holds that the goal of human life is to perfect oneself, through virtue and contemplation, into an experience of the fullness of life available in the eternal realm of Forms, and, in so doing, to arrive at a point at which one may transcend the self, even the noetic self, in a union with God.<sup>10</sup> Our experience of the spiritual or noetic life is made possible through the "undescended" aspect of the soul, which does not tend the body but looks perpetually toward the Forms.

Porphyry makes clear in several places within *De abstinentia* that harm or injury to humans or nonhumans is an obstacle to this realization of human perfection. This is explicit in Book III.27, where he states: "he who does not confine harmless conduct to men alone, but extends it to other animals, is more similar to divinity." He goes on to advocate an extension of this ethic to plants as well, although he suggests that we cannot be entirely harmless to plants. Although Porphyry is not specific about why he believes this, one must assume that he is thinking of our needs like building houses

and weeding our fields, but not the eating of plants, since elsewhere (II.13 and III.26) he points out that we do not injure plants when we gather what they will cast off (i.e., nuts, fruits, and most vegetables) or harvest those of them that are dead (i.e., grains).

Why does harming nonhumans prevent humans from experiencing the noetic life? Porphyry argues that Divinity, whether noetic or that of the One, is innocuous, and that our best assimilation to the Divine comes through our own harmless conduct (III.26). However, he never is explicit in precisely defining the nature of harm, in establishing how the killing of nonhumans for food constitutes a harm, and in explaining exactly how a harmful action serves to separate us from Divinity. Perhaps this is because such explanations were tacitly understood within the Neoplatonic position held by Porphyry and Firmus Castrius. Whatever the case may be, it is left to us to expand upon Porphyry's argument, to fully explain its importance to Neoplatonism, and to assess its applicability to the modern debate.

First, harm must be defined. Harm or injury must involve the loss of some measure of good because injury constitutes an impairment, which means a worsening in quality, ability or value, and being worse is, by definition, none other than the state of being less good. Consequently, harm is a loss of good, and a harming action is a taking away of good. Moreover, killing must be regarded as a type of harming act in the sense that death constitutes a worsening in quality, ability, or value; in particular, a loss of all of these.

However, harm must be more carefully understood, since what appears to be an act of harm may not always result in a loss of good. For example, while cutting off a gangrenous leg may result in an impairment in one's ability to walk or run, and therefore a loss of some measure of good, leaving it in place will cause blood poisoning and result in death. So while this act has caused a loss of good in the sense that the one can no longer walk or run as well, it also has prevented a loss of good in the sense that the death would render one unable to do anything as well. If the act of harm is a taking away of good, how do we assess this act in which good has been both taken away and provided? We must determine whether the net result of the action is a loss of good.

To do so, it must be pointed out that since life is prerequisite for walking or running, the loss of life is inclusive of both that

proportion of good lost in a loss of life and also that proportion of good lost in the loss of a leg, while the loss of a leg is not inclusive of the that proportion of good lost in the loss of life as well as that lost in its own loss. If the loss of life must involve a loss of a greater proportion of good than the loss of a leg, then the prevention of the loss of life provides a greater good than that lost, and the net result of the action is a giving rather than a taking away of good. In this sense, if harming is a taking away of good, the act cannot really be characterized as one of harm.

Accordingly, an act of harm is actually that which remains a taking away of good after what is given, in other words, a net harm. As in the example provided above, we can assess whether an act is a net harm by establishing the degree to which certain qualities are prerequisite for others, and, when taken away, involve the loss of a greater proportion of good than that to which they are compared. Life is prerequisite not only for walking and running, as in the above case, but it is clearly required for pain or pleasure or for any activities and experiences at all. Existence is required for life in the sense that the existence of a species is essential for the life of its members or existence as what you are is prerequisite for your life to be yours at all. Therefore, this order of prerequisites indicates existence as the most basic thing that can be taken away, then life, and then the various attributes of living experience. With this established, it becomes evident that any removal of life or existence not done in order to provide the same or more basic of the two would involve the loss of a greater proportion of good, thereby leaving the act a taking away of good, and constituting a net harm.

Next we must determine whether human killing of nonhumans for food constitutes an act of net harm. In order to do this, we must establish whether taking life from nonhumans for food is done in order to provide life or existence for those humans responsible for this act, either those who consume the nonhumans or those who kill them for consumption. In the continuing life of humans who follow a vegetarian diet, and there are a great many, we clearly experience the superfluity of eating slain animals for human life or existence. In addition, the ongoing life of other humans who also refrain from eating plants that are uprooted for consumption, but subsist entirely from the fruits, nuts, grains, and those vegetables that either do not kill the plant when taken or are harvested after the plant has already died naturally, demonstrates the superfluity for human life or

existence of eating killed plants. As a result, the taking of nonhuman life for food is not done in order to provide life or existence for the human consumer.

In the case of the humans who make a wage from the killing of nonhumans for consumption, the continuing life of the unemployed makes clear that employment is not necessary for providing life, and, therefore, that their killing is not done in order to provide for their life or existence. In the end, it is obvious that the act of taking nonhuman life for food is not undertaken in order to provide human life or existence for the consumer or those killing for human consumption. Therefore, since the taking of life is not balanced or exceeded by the provision of life or existence, the act remains a taking away of good, and is a net harm.

Several objections may be made to this assessment. First, does not the killing of nonhumans for consumption provide life to those destroyed so that humans may eat other things that are not killed? Must we not cut down wild vegetation and destroy creatures living there to grow crops, and must we not, when gathering wild nuts and berries, take sustenance from creatures that would otherwise eat such foods? Second, by killing nonhumans for food do we not give life to other nonhumans that would be consumed by those we kill or to those whose sustenance would be consumed by those we kill? Third, what about the limited character of our knowledge. How do we know that when we do not take a particular nonhuman's life, we are not actually taking away something more basic; for example, if the nonhuman subsequently eats another that is the last of its species, thereby taking away existence?

Each of these arguments seeks to avoid the net harm assessment that results from weighing the taking of nonhuman life for food against what is provided for the humans who are responsible for the act by pointing to real or conjectured provision of life or existence for other nonhumans as a repercussion of the act. However, in every case the arguments are essentially irrelevant to our assessment. First, when we grow crops or gather wild foods we also provide life for the crops and creatures that thrive in agricultural fields, and, when we gather wild foods, we provide life for creatures that consume any creatures that die without such foods. Similarly, if by killing nonhumans for food we save the lives of nonhumans they would kill for consumption or as a result of resource competition, our act also takes life from those nonhumans that would otherwise

eat the nonhumans we consume, as well as from those that would have sustained themselves from the bodies of the creatures now spared from death due to our action.

In the final case, we can speculate that it is just as possible that the nonhuman we kill for food will not cause extinction of another species, and may, in fact, preserve a species through a future action or through its own peculiar genetic variations that may prove invaluable in a time of future climatic change. In every instance, reality or possibility leave us with a series of balances of life taken with life given, and by canceling that taken with that given, returns us to the original assessment of the act of killing nonhumans for food solely in terms of whether that act is done in order to provide life or existence for the humans responsible for it. As we have seen, that answer is no, and the act of killing nonhumans for food is, by consequence, a net harm.

Faced with such a conclusion, it remains to be determined how such an act is an obstacle to the Neoplatonic goal of human perfection. The answer to this problem lies in metaphysics. From a Neoplatonic perspective, one may contend, with Porphyry, that the Divine Forms and the One are donative, in the sense that the former give existence to all the things in the physical world that participate in them and the latter is ultimately the giver of all things through the emanational process. However, acts of harm, including the killing of nonhumans for food, are, as we have seen, by nature privative. As a result, the act of harming others cuts a human being off from the donative nature of Form and the One. Unless we cease to be harmful not only to our fellow humans but also to nonhumans, we will not be able to experience the spiritual life available to us through the undescended aspect of our souls, or place ourselves in a position to transcend even that life and experience the Source of All. It is both the donative nature of the spiritual life to which we aspire and the privative character of the act of harm that appear to have led Porphyry to regard harmlessness (*ablabeia*) as essential to the goal of human life.

In this interpretation and expansion of Porphyry's position, we have seen how *ablabeia* is an essential component of life for those who accept a Neoplatonic metaphysical perspective. Some might conclude that without this metaphysical framework there is no moral imperative for the embracing of the harmlessness ethic. However, that the *ablabeia* argument should also be of concern to

any person who seeks to do good and avoid doing evil, becomes immediately manifest upon a rational consideration of what evil is.

It is clear that evil is different in every way from good, being the very opposite of good. It is also obvious that a thing which differs in every way from some other thing obviously must possess nothing of that from which it differs, since otherwise it would not differ in every way. Therefore, if evil differs from good in every way, then it must possess nothing of good. If evil possesses nothing of good, then we would not doubt be correct in asserting that evil is an absence of good, since nothing of good being there is clearly the same as good being absent from there. If we so conclude that evil is an awayness or absence of good, then it follows that doing evil is the causing of good to be absent, the taking away of good.

This conclusion, taken together with the position, established above, that the act of harm is a taking away of good, indicates a direct correlation between harming and doing evil. To do harm is to do evil, for each is nothing other than the act of taking away good. Since an act of harm is thus an act of evil, and since killing nonhumans for food has been shown to be an act of harm, this act is also an evil action. Hence, anyone who seeks to avoid doing evil, must avoid killing nonhumans for food. That person also must begin to assess all of his or her activities, with regard to humans and nonhumans, according to the same principles established for the issue of killing nonhumans for food. Unless it can be certainly established that any act of taking away some measure of good from another creature is done in order to provide something qualitatively equal or more basic than that which is taken, the act must be considered not only one of harm but one of evil.

When comparing the *ablabeia* approach with the current rights approach, it is evident that the former possesses two significant advantages. First, it is far more inclusive, extending moral consideration to plants as well as animals. In any case where an act of taking life is not required to provide life or existence, as in diet, there is no moral relevance for what kind of life is involved. Our act in such an instance would be evil whether the life taken is that of our father, a hog, or an evergreen. Even in the case of deciding conflicts of life against life, for example in the cases of microbes we kill as we breathe or deadly viruses we kill with a vaccine, the type of creature involved is not important. In these cases, our act of taking the life of the other can be regarded as justifiable not

because our life is more valuable than that of the other, but the act is done in order to provide life for us. In any case like this, whether involving us individually or others, we must only kill or permit killing if it is certain that taking life is necessary to preserve life or existence (i.e., of a species). It becomes incumbent upon us to try to find any way to prevent a death that does not involve taking another life, and only if no alternative is found can we truly balance the life taken with that given, and avoid doing evil. This position avoids the rather arbitrary distinctions, traditional to Western moral philosophy, which still pervade much of modern animal rights literature. In this way, we need not enter into subjective value judgements in order to determine whether the life of a tree is as worthy as that of a flea, that of a flea as that of a dog, that of a dog as that of human.

The second advantage of the *ablabeia* approach is that, unlike the rights approach that requires the proponent of moral behavior towards nonhumans to enter into an essentially subjective assessment of nonhuman inner life, the *ablabeia* position pushes the burden of subjectivity into the opponent's camp. In instances such as diet, where taking of the life is not done in order preserve life, the opponent of extending moral concern to nonhumans must prove why differences between humans and nonhumans make human pleasure as basic or more basic than nonhuman life, and, thereby, that killing for such pleasure is not a net harm and evil. This is not easy. Pleasure is an experience, and life is prerequisite for all experiences, whether human or nonhuman. Therefore, human pleasure is equivalent to the level of nonhuman experiences, but not to nonhuman life. In order to avert such a conclusion, the opponent would have to prove that human differences from nonhumans make us so far superior that even our experiences are as basic or more basic than nonhuman life. It is unlikely that the opponent will ever be able to show why these differences make for superiority without the dogmatic retreat to a subjective value judgement that having rationality or self-identity (for example) is better than not having them or a religious belief that humans are simply just created as superior entities.

In conclusion, the *ablabeia* approach, rooted in Neoplatonism but not confined to it, can provide an argument for moral consideration of nonhumans (and humans as well) without reliance upon reading their inner lives. It explains why killing without doing

so in order to provide life or existence is evil, not in terms of a violation of rights, but in terms of the nature of the act itself. It also demonstrates how such an act serves as an obstacle to the agent's full experience of the spiritual life.

## Plotinian Roots of Ecology, Post-Normal Science and Environmental Ethics

Laura Westra

### Introduction

I have recently argued for the necessity for an altered world-view, to permit us to transcend our present destructive interaction with our natural environment (Westra, 1994). Recent ecological paradigms taken primarily, but not exclusively, from complex-systems theory, conservation biology and post-modern science, often use concepts that can be traced back to Plotinus. The ecosystem approach I have defended is holistic (Kay and Schneider, 1994), and consonant with post-normal science and with its support for the intimate connection between values and scientific knowledge, whereby the former are a constitutive part of the latter (Funtowicz and Ravetz, 1991). Because of this connection, whether or not it is explicitly acknowledged, some important Plotinian concepts can be shown to be relevant to both science and ethics, in regard to the environment.

Some recent work has traced the connection between Plotinus and "deep ecology," for instance Richard Evanoff's "An Ecological Reading of Plotinus," and Donald Blakeley's "Mystical Unity and the Cosmos in Plotinus," to name but two. I have also defended the role of "freedom" in Plotinus, through an analysis of *Enneads* 6.8, which further emphasizes these connections and that unity.

Complex systems theory demonstrates the lack of predictability in science, leading to a certain "freedom" in the possible evolutionary trajectories of natural systems.

One can fairly say that there are several interesting conceptual links between Plotinus' thought and current paradigms in both environmental science and ethics. There can be viewed under three major clusters of issues, 1) unity, 2) freedom, and 3) value, and the

connection between them. These issues will be discussed in turn, tracing Plotinus' position in each, then relating them to present day ecology, "deep ecology" and ecocentric ethics.

### I. Unity

There is no problem in establishing textually the centrality of unity in Plotinus's thought. The One is the Source of all that is, and the intimate connection between the One and the natural creation that He engenders cannot be denied. First of all, there is our kinship with all that exists. Plotinus says: "For anyone who feels affection for anything at all, shows kindness to what is akin to the object of his affection and to the children of the Father he loves" (2.9.16.7ff.). These children appear to be the "heavenly bodies," so that the "sympathy" with all for which Evanoff argues, can at least be said to apply to natural entities (R. Evanoff, 1994). In fact, the whole discussion takes place in the Treatise (2.3.7). "Are the Stars Causes?" The argument proceeds from the description of the functioning of an organism, to that of the functioning of the whole.

Plotinus speaks of "the eyes...or...some other part of the body," and says, "If these parts of us are members of a whole, so are we: in different ways the one law applies" (2.3.7). Below, he adds:

All things must be enchain'd; and the sympathy and correspondence obtaining in any one closely knit organism must exist, first, and most intensely in the All. There must be one principle constituting this unity of many forms of life and enclosing the several members within the unity, while at the same time precisely as in each thing of detail, the parts too have each a definite function, so in the all each several members must have its own task...(2.3.7).

Further, these "functions" are interconnected so that "each receives something from the others" (ibid.), and the functioning of the whole universe is governed by the "Law of Justice," which provides both "orderliness" and "the power of the controlling force" (3.3.8). The whole is thus a well-ordered unity of which we are a part. Armstrong observes:

...we may at least begin to feel again the need for some sense of unity with our world and not be content to stand apart from it and isolated,

superior thinking beings, over and against a mass of brute matter...without worrying about any nonexistent cosmic holiness or intelligence...(A.H. Armstrong 1976).

If we accept this interpretation of Plotinus, it permits us to reconcile Plotinus' explicit words here, with his well-known *rejection* of "sympathy," in regard to other humans. I have argued that Plotinus's doctrine does not permit the latter: "sympathy" was viewed by the Stoics as a sin. Plotinus argues systematically against involvement, as we should strive not to be affected by the pain of others, any more than we should permit even our own pain to affect "us," or our higher soul. It is worth noting, however, that Plotinus wants to *teach*. Perhaps making people's *souls* better, is the only true concern permitted. Christians exhort people to "love thy neighbor as thyself." Plotinus, paradoxically, could say the same thing, but only in an equivocal vein: we must not "love" ourselves, at least, not in the ordinary sense of our everyday embodied, separate selves. Our concern must be limited to our upper souls, and perhaps to those of others, as for instance even suicide is preferable to losing one's ability to remain aloof (Westra, 1990).

Our "sympathy" therefore, is far more consonant with environmental concern, than with a human doctrine of emotion-based morality, such as that of David Hume, for instance. Donald Blakeley discusses Plotinian "sympathy" in relation to unity; he says, "the unity that is realized in the material realm Plotinus identifies as sympathy" (D. Blakeley, 1994).

This brief discussion of the role of sympathy serves to underlie one of the bases for unity in the cosmos; the other is clearly our co-generation by the one, and our co-dependence upon Him. But the connection between unity and the Plotinian universe, may be understood best by turning to Plotinus's treatises on "Providence" (III.2, and III.3). The value and the importance of the physical universe is dependent on its unity, which originates with the One. In contrast with Plato's depreciation of changing, embodied reality, Plotinus emphasizes its derivative Oneness, hence its origin, while defending the universe as "good," possessed of a goodness both compatible with and derived from its (planned/willed) diversity and multiplicity. Plotinus further emphasizes those aspects of the cosmos which show it to be neither predetermined nor mechanical in its unfolding:

To make the existence and coherent structure of this Universe depend upon automatic activity and upon chance, is against all good sense (III.2.1).

In order to avoid this facile conclusion, Plotinus argues, we must understand both *how* and *why* all things were made. The Cosmos is a unity. "...a life living and having intellection as one act within a unity: ...for there is no separation of thing from thing, no part standing in isolated existence from the rest..." (III.2.1). The intellectual principle, or Reason within this whole, "has brought the universe into being," as from a "seed," so that all future growth parts and processes are concentrated within a single identity. Hence, any dissonance that may arise in the cosmos, is a product of this "mixed thing," of the diversity arising from embodiment out of a single, unitary principle. Its beauty and harmony are limited to what can be absorbed by a physical mixture, and ought not to be judged deficient, each viewed in isolation.

In contrast, the Cosmos' beauty and nobility (the best possible under the circumstances) arise from the Source of all, and each thing can be judged only in relation to the (beautiful) totality. The diversity engendered within the Cosmos' totality must be accepted as necessary and beautiful as well, and we have no right to demand that everything within this totality be a "mass of fragments," all equal to one another (III.2.3). Elsewhere Plotinus suggests that, if we expect all to be equally excellent, we are as misguided as if we were to require that toes and fingers should see, not only eyes, or if we expected a beautiful painting to be filled with "all eyes," or all light, without shadows and neutral aspects, better to bring the more vibrant aspects of the work into relief (III.2.11).

It is equally wrong to expect the cosmic unity to exhibit nothing but perfection throughout: embodiment and diversity are the result of Divine design and—as such—must be less than perfect, as it belongs to a lower level, far from the Beauty of its Source. The beauty of the Cosmos lies precisely in the contrasts within the whole, as it is governed by harmonious natural laws. To a great extent, we must abide by cosmic laws. When we attempt to defy them, evil will follow; sometimes evil will happen even if we don't, and it is hard for us to understand the reason for it. Essentially, though, *justice* governs the cosmos and the relation between all its parts now and in the future. If we attempt to work against them, our

defiance will not go unpunished, either now, or at some future time, hence the beauty, orderliness and justice of the whole will not be affected.

Although Plotinus does not stress the "scientific" facts he presents he clearly expects his hearers to understand them as he does. Neither the existence of the cosmos, nor of the laws, regularities and justice that reign within it are ever in question. His main concern, instead, is to reconcile the fact "Divine Reason is the beginning and the end" (III.2.15), hence that the cosmos must show rationality and order—with the fact that, for this order to prevail, "...the devouring of Kind by Kind is necessary as the means to the transmutation of living things." These occurrences, although constant, appear to be random, ugly and, at times, unfair; but if we adopt the right perspective, we must acknowledge that things "go to their dispatch," only to be "serviceable to others."

Nothing truly dies, because things that are killed simply return in a new form. Plotinus' example is that of a play in which some actors may be murdered, but eventually will re-appear in the *next* act of the play, in different costumes:

Murder, death in all its guises, the reduction and sacking of cities, all must be to us just such a spectacles the changing scenes of a play; all is but the varied incident of a plot, costume on and off, acted grief and lament (III.2.15).

The individual dissonance, however, unites in a complete "harmony" (III.2.16), composing contraries, "white and black, hot and cold, winged and wingless...reasonable and unreasoning—but all these elements are members of one living body, their sum total." Thus there are Reason and Unity in the whole, and it is wrong-headed and useless to seek *either* in each individual action and event. For Plotinus, we can and must understand the unity of the cosmos and of its regularities and laws, before we can understand what is right and wrong, and why. The basis for moral understanding is our dependence upon the One, and that is determinant of our role and our destiny within the universe.

I don't believe it is necessary to amass further evidence to prove the role of the One in the Plotinian corpus, as Primary Source of all that exists, and we'll return to this theme in the next section. For now, we need to turn to ecology and environmental ethics, in order to show their relation to unity.

## II. Unity, Ecology and Environmental Ethics

The most obvious connection between Plotinus and recent environmental thought is precisely through the very interconnectedness that ecology demonstrates. It has formed the basis for Aldo Leopold's *Land Ethic* (A. Leopold, 1969), as well as from my own "principle of integrity" (Westra, 1994; Westra, 1998). It has also influenced Arne Naess's "deep ecology" platform, although he does not appeal to ecological interconnectedness specifically.

The ecosystem approach I support, demands a unitary understanding of the biosphere, or of each ecosystem, in order to support ecosystem function: one cannot refer to personal or organismic integrity, without subsuming *identity* in the concept. In other words, a holistic approach *must* view the system under consideration as *one* in order to be able to discuss coherently whether or not it may be healthy, or subject to too much anthropogenic stress, and whether it may possess integrity. To view an ecosystem as a functional whole, providing life-support to its parts, is to view it as *one*. Aldo Leopold's landmark statement, "a thing is right when it tends to promote the stability, integrity and beauty of an ecosystem, wrong when it tends otherwise" (Leopold, 1969), suggest that certain characteristics are not only prudentially desirable on our part, but that they are the result of morally right action. All these characteristics are to be attributed to one system, or rather to any *unitary* system.

In his book, *Life Itself*, Robert Rosen discusses both function and self-identity of systems in a chapter entitled "entailment without States: Relational Biology." He speaks of "heterogeneous systems," wherein "one part looks different, or behaves differently from another part." He continues:

If we leave the system alone, some autonomous behaviour will ensue. On the other hand, we can ask a question like: if we were to remove, or change, one of these distinguishable parts, what would be the effect of that behaviour? It involves a new element, not merely observation, but willful active intervention. The results of that intervention is, in effect, the creation of a *new system*, which can be regarded as a kind of *perturbation or mutilation* of the original one (R. Rosen, 1991).

As Aristotle would say, there is a significant difference between a random heap and an organized whole. Integrity identifies the evolutionary, naturally optimum state of this organized whole, an ecosystem, although it is not possible to fully limit and circumscribe each ecosystem as such.

We can conclude that cosmic interconnectedness and the primacy of unity, both central Plotinian concepts, are very much in existence, as articulated today through the science of ecology and the ecocentric theories of environmental ethics, although the latter have not been discussed yet in essence. Aldo Leopold's position suggests that man should no longer consider himself separate from the rest of the natural world, and a creature apart, a master of all. On the contrary, because of the interconnectedness of all natural entities and their interdependence, humans must realize that, physically, they are simply part of the biota of ecosystems. They must fully acknowledge this kinship and learn to love, not master the land. Natural entities are not only "resources" for mankind, that is, things which only have value because we value them. On the contrary, Leopold ascribes intrinsic value to natural wholes, beyond the instrumental value they may possess for humans, and many have argued this way as well (Rolston III, 1986; Westra, 1994; Westra, 1998).

My position is also both biocentric and holistic. Integrity is a specific state of ecosystems. It is not pristineness, but it is "wild," that is, natural systems that possess it are not managed or manipulated. A percentage of all landscapes, globally, ranging from 15% to 45% (Noss & Cooperrider, 1994) must be left "wild," or unmanaged, in order to support the existence of the rest for sustainable human use. In a state of integrity, a system can pursue its own natural evolutionary path, it is resilient when stressed, and it retains the optimum capacities of which it is capable at a specific time and location. Ecosystem integrity goes beyond ecosystem health, because the latter is compatible with management and manipulation, as well as the loss of certain parts, provided that a desired function is maintained. As an example, we can think of a human being who is healthy, but needs insulin on a regular basis, because he is diabetic, glasses to see, and perhaps some other medication to support another minor ailment that might still permit him to reach a ripe old "healthy age" (Westra, 1994).

The functional and historical role of biodiversity is central to integrity. But what is required is not simply maximizing numbers of species, which might include the addition of exotics and perhaps bioengineered "aliens" into the systems, but respecting the optimum biodiversity required by the naturally evolutionary paths of each specific system (Westra, 1994; Karr and Chu, 1995). The respect for both cosmic laws and for the Source of the cosmos that are required by Plotinus, one could argue, *also* will not permit the intentional interference with either the logos or the Divine plan of the universe, through our extraneous interventions.

Hence, it will be required to respect enough wild areas to permit the orderly unfolding of evolutionary paths, and the preservation of the life-support role they are designed to play. For Plotinus, one could argue, all entities within the cosmos possess intrinsic value, in two senses: a) they represent a valuable part of ■ biodiverse divine design; and b) they each play a specific role in the functioning of the cosmos, and they support and facilitate the orderly unfolding of its laws.

Intrinsic value of natural entities is also asserted by Arne Naess who speaks strongly in support of the wild, and recommends in his platform an altered life-style based on a changed awareness of the value of nature, and we'll return to this topic in the last section of the paper. We can therefore conclude that cosmic interconnectedness and the primacy of unity, both central Plotinian concepts, are very much in existence in reality, as articulated today through the science of ecology and the ecocentric theories of environmental ethics. Moreover, even the effects of this understanding are viewed as morally significant by Plotinus. That is, for Plotinus, once we realize that we are part of a created universe, a manifestation of the will of the One, then our role within this universe defines the parameters of our intellectual and moral activity. Plotinus' view of virtue, however, cannot be helpful as a parallel for environmental ethics. Rather, the step I propose is to see the similarities between Plotinus' metaphysics and recent ecological theories which are also used to define in some sense the limits and parameters of our morality. Most ecocentric environmental philosophers view these facts as equally morally significant—pace David Humc, and his is/ought distinction. Our position as *parts* of a functioning whole which is also somewhat purposive, *limits* the rights we presume to have to interfere with

natural ecosystems; hence it supports the moral value of the *negative* commands of environmental ethics, beyond their purely prudential value. A holistic environmental ethic argument suggests, in general, that the physical realities of the universe do not support a sharp distinction between the moral considerability extended to our species or at least to the individuals within it, and the purely instrumental consideration that characterizes our interaction with non-human nature. Plotinus suggests that our kinship with all in the universe is metaphysically, hence morally, significant.

Neither Plotinus nor any ecocentric deep ecologist intends to say that what "is," represents the "ought" of morality: yet *both* would agree that our place within the cosmic whole, as well as the understanding of the structure and origin of this whole, helps us understand our *moral* role within it.

### III. Freedom—Ecology and Ethics

I have argued that Freedom, in its various senses, and in its different applications to the One and to us, is the central concept in the *Enneads* (Westra, 1990). However this is not a generally accepted position: with the exception of *Enneads* 6.8, the main focus of my work, only four instances of the use of *eleutheros* are present in the whole Plotinian corpus (although the expression *autexiousios* is more common). This fact has perhaps discouraged scholars: thus it is primarily Paul Henry, and even more Vincenzo Cilento, who have seen the same emphasis in Plotinus, and discussed it. Based on Cilento's work, I found ten senses of Freedom in Plotinus: 1) Freedom as Contemplation; 2) freedom as salvation; 3) freedom as genius, ease of life, or man's "daimon"; 4) Freedom as explanatory principle; 5) Freedom as conclusion/culmination; 6) freedom as the good; 7) freedom as one's nature; 8) freedom as root of existence; 9) freedom as unity; 10) freedom as creation (Westra, 1990). As this paper is concerned with the natural environment, only "freedom as root of existence" and "freedom as creation" appear truly relevant, as well as "freedom as unity." "Root of existence," pertains clearly to the One, who is causative of all that is. Like the One, whom Cilento characterizes as absolute freedom, both unity, creative power, and existence itself are *freely* flowing from the One, as neither random

chance nor constraints of any sort are possible with Him. Plotinus says:

No more than in the circle are the lines or circumference to be identified with that center which is the source of both: radius and circle are images given forth by indwelling power and as products of a certain vigour, not cut off from it (6.8.18).

Freedom is the source of power: "...it generates Intellectual Principle by its sheer wealth" (6.8.18). If we identify the One with freedom, then freedom is creative power, both the root and the final aim of existence as our returning to the Source is the moral aim for which we must strive. The Source of all and Primary Cause is Freedom. Just like goodness, then, freedom will be a characteristic of all that He engenders, in progressively diminishing levels. Metaphysically, freedom, for Plotinus is what we must strive for, within our capacities, and it is solitude in the sense of detachment and aloofness: the last phrase of the *Enneads* is precisely the flight of the alone to the Alone. But this solitude is dynamic, not static, it is creative, contemplative.

It is hard to say precisely what level of freedom is left at each level of creation. Once again, it is instructive to turn to complex systems theory and its applications to ecology. We need to understand systems' behaviour, so that we can acquire a better understanding of what level of management (if any) is safe, from the ecological standpoint. James Kay explains Prigogine's position and its implications:

An open system with high quality energy pumped into it is moved away from equilibrium. But nature resists movement away from equilibrium. So the open system responds with the spontaneous emergence of organized behaviour that uses the high quality energy to maintain its structure, thus dissipating the ability of the high quality energy to move the system away from equilibrium (Kay and E. Schneider, 1994).

The first thing to note is that this science proposes explanations which are radically different from the linear science of old. It is important to note the terminology used in the last scientific quotation: we are speaking of "spontaneous emergence" of "organized behaviour." There is an intrinsic freedom to material entities and even stranger, to material wholes, which manifests

itself through spontaneity and the rise of emergent properties that cannot be predicted or anticipated necessarily from our knowledge of either the system or its component parts as in many senses we cannot derive complete knowledge about the behaviour of a whole, from adding together the behaviour of all its component parts. Kay says:

This view of the world is radically different from that of a reductionist view which sees the world's workings in terms of mechanical interactions between the components of a system. The emergence of organized behaviour, and even life, is now mandated by thermodynamics (Kay and Schneider, 1994).

In place of mechanistic theories, we must now turn to "catastrophe theory" to "describe the change of systems over time." Changes can be expected, but they will not be necessary or continuous. There is nothing abnormal, however, about catastrophe theory, which incorporates the occurrence of "surprises" without claims about complete predictability. Hence, it portrays the behaviour of natural systems and their evolutionary development, far better than the precise models often still favoured by Newtonian scientists.

For our purpose, therefore, what is significant is the fact that "emergent" behaviour of systems, like "emergent" properties of species, are both spontaneous, that is, they are essentially free, although, clearly, there is no "intention" or other cognitive activity in either natural organisms or systems. Yet these organisms and systems are not completely free, in the sense that a savannah or rain forest ecosystem cannot "flip" into a desert or arctic system, without massive external stresses. Rather, within each system's geographical and temporal location, there are several evolutionary paths and trajectories that can arise.

For Plotinus, contemplation (*theoria*) informed the world, hence rendered it intelligible, in some cases, even intellective, and—in a descending order—*somewhat* free, although the One's absolute freedom cannot be found elsewhere. Contemplation originates with Nous, from the One; in their different ways, all things contemplate and possess at least some minimal capacity for freedom. According to catastrophe theory (a misnomer that simply indicates the possible occurrence of unpredictable events), "The world does not change in a continuous and deterministic way" (Kay and Schneider, 1994). Kay adds:

Chaos theory takes this one step further by noting that change in a dynamic system is ultimately not predictable, because individually small interactions between components accumulate.

In environmental ethics, the protection of ecosystem integrity is ultimately simply protection of their capacity to regenerate, to recoup and recover from imposed anthropogenic and other stress, and thus permit them to continue their own evolutionary process of development. Hence respect for ecosystem integrity is primarily respect for the same systems' capacity to freely follow their evolutionary path. *Ipsa facto* it also supports our capacity to freely develop (in the physical sense), rather than have our lives stunted or blighted through ecosystem damage. I have argued that the principle of integrity emphasizes *freedom from* interference with a system's unfolding (and our natural unfolding which parallels it). It also supports the freedom of a natural system to actualize itself, within it the self-actualization of all natural entities.

The importance of natural *freedom* is thus undiminished since Plotinus' day. Because of this freedom, science today raises far more questions than it can answer:

Consequently our ability to forecast and predict is always limited, for example, to about five days for weather forecasts, regardless of how sophisticated our computers are, and how much information we have (Kay and Schneider, 1994).

For Plotinus too, the "Universe is immensely varied, the container of all reason-principles and of infinite and diverse efficacies" (IV.4.36). And, although each member has a life of its own, Plotinus adds, "this however does not imply ■ deliberate intention" (IV.4.36). This point can be supported through distinguishing "tending" from "intending" in ecosystems, where the former concept, and not the latter is used to express the unfolding of their natural evolutionary processes (Westra, 1994). Rolf Sattler discusses teleology in his *Biophilosophy* (R. Sattler, 1990). He suggests four separate senses that can be ascribed to the concept, only one of which escapes modern scientific critiques. He describes this sense of teleology as follows:

The laws of nature are held responsible for the goal-direction of the sequential behaviour which is also called developmental teleology...the

role of consciousnesses excluded...genetic programs are also considered to be important in this respect, because they are "selected...."

Hence, it is in freedom, understood as free creativity (Westra, 1990), that one finds the closest parallel to some recent ecological approaches, as well as to ecocentric environmental ethics, insofar as these depend in some sense on those new paradigms. Plotinus says, "We cannot think of the universe as a soulless habitation...it must be alert throughout" (IV.4.36). "Life" and "alertness" seem to indicate precisely the self-organizing processes that the call to integrity I have proposed, is intended to protect and restore.

Things and systems in nature change, evolve, and go through a constant cycle of birth, growth, death and renewal, the "devouring of kind by kind," that Plotinus cites (III.2.15). The "information" that is somehow preserved through these changes, is a reflection of what works, of what the system "learns" in order to adapt and respond to changed climatic and other circumstances. For Plotinus intellectual "formation" and intelligibility are part of the nature of the universe. And if all is informed in various proportions, and, as we have seen, all contemplates as it is ■ reflection of the powerful free creativity of the One, then we can see that Plotinus discovered a long time ago some of the principles of chaos and of complex systems theory; he also appeared to indicate the evolutionary role played by genetic information at the level of the single organism. This in turn translates into biodiversity at the systemic level.

The argument I have proposed supports the existence of links between Plotinus and ecology in its recent paradigm. In the next section these common concepts will be related to value, or the "good" in Plotinus in order to trace the connection between Plotinus, ecology, and environmental ethics.

#### IV. The Good in Nature

Spontaneous creation and "self-realization" as it occurs in the Plotinian universe is good, and all in it is valuable, because of these characteristics, which ultimately depend on the One. In his treatise "Against the Gnostics" (II.9), Plotinus defends the beauty of all nature and its value. Nature exists at a lower level than the

perfection of the One, yet it does come from Him and the World Soul. It is this fact, that is, the origin of all nature, that guarantees its value for Plotinus. He says:

No doubt it is a copy, not original; but that is its very nature; it cannot be at once symbol and reality. But to say that it is an inadequate copy is false: nothing has been left out which a beautiful representation in this physical order could include (II.9.8).

The position Plotinus adopts must be viewed in relation to his metaphysics. What is the relation of the natural world to the One? How did matter come to be, why and what is its role? All creative acts starting from the One, might be viewed as declines from complete perfection, as they are movements toward lesser entities. Yet Plotinus hastens to clarify what he means: "We assert its creative act (that of the All Soul) to be a proof not of decline but rather of its steadfast hold" (II.9.4). Hence it is incorrect to view all "enmattering" as descent into darkness and evil. To do so, casts an unfavourable light upon all creation, and "taints" the Primals:

In fine the theory amount to making evil one of the Primals, and with it the matter from which it emerges... (II.9.12).

Aside from the human component of *tolma* (wilfulness), which starts us on the road to otherness and separation, coming to be embodied is not sinning, it is doing something right, good and proper to fulfilling the plan of the universe (IV.8.1). The plan of the Universe requires lesser entities in addition to the One:

There is a reason why the Soul of this All should be sent into it from God: in the same way the soul of each single one of us is sent, that the Universe may be complete (IV.8.1).

Diversity is needed for completeness, and it comprises declining entities as well as entities from a higher realm. Yet the body inhabited by the World Soul "is complete, competent, selfsufficing, exposed to nothing contrary to its nature" (IV.8.1). For Plotinus then, the natural world as planned, cannot be total, progressive evil: it can perhaps be the occasion for the possibility for evil, while at the same time, it is also the ground for the possibility of reascent to the One. Responding to the claims of the Gnostics, Plotinus says:

They cannot deny that the Soul of the Cosmos has exercised such a weight of power to have brought the corporeal principle, in itself unlovely, to partake of good and beauty, to the utmost of its receptivity—and to a pitch which stirs souls, being of the divine order (II.9.17).

By its very nature, the corporeal principle is not beautiful. It is the intellection and beauty with which it is informed that add loveliness and intelligibility to the corporeal. Through Soul then, the material world is helped to fulfill its role in the complete plan of the universe. Thus we must not condemn the world: it is "no disgrace to the Maker" (III.2.3). Plotinus says:

It is therefore impossible to condemn the whole on the merits of the parts which, besides, must be judged only as they enter harmoniously or not into the whole....To linger about the parts is to condemn not the Cosmos, but some isolated appendage of it; in the entire living Being we fasten our eyes on a hair or a toe, neglecting the marvelous spectacle of the complete man (III.2.3).

There must be, then, both good and beauty in the whole world as the world is totally immersed in the World Soul. Cilento translates it: "The world is immersed in soul as a net in the sea." Further, "Soul spreads order and beauty on our Universe with a tranquil power" (Cilento, 1971; *Enneads* III.8, V.8, II.9 and IV.8.2). The ontological potential of nature and its status, arising from the role of contemplation and intelligence upon it, are the two aspects of its beauty and value:

This then is how the material thing becomes beautiful, by communicating in the thought (Reason, Logos) that flows from the divine (I.6.2).

It is not surprising, that ecocentric ethics of the environment also relies on "wholeness," potential and capacities, and unitary tendencies in ecosystems to support their value, both intrinsic and instrumental.

In the discussion of freedom, the relation between "self-realization" and freedom was emphasized. In Plotinian terms, the value of both is based upon their origin in the One. In ecocentric environmental ethics, as well as in the biocentric holism I defend,

the Plotinian ground for the "good," and the spontaneity, "self-realization," and ontological capacities of nature are deemed sufficient to support its intrinsic value (Westra, 1994; cp. P. Taylor, 1986; A. Naess, 1991; Evanoff, 1992). Evanoff (1992) has argued that "the history of Western thought...is the history of the progressive alienation of value from nature..." and many others have taken a similar position before him (L. Whyte, 196; L. Moncrief, 1970; M. Oelschlaeger, 1991). Still other, have contrasted Western ideas, both philosophical and religious, with non-Western secular and religious attitudes and beliefs (O.P. Dwivedi, 1990; L. De Silva, 1987; M.Y.I. Deen, 1990; O. Kokole, 1995). Evanoff sees the split between the secular and the religious as the single major problem in the devaluation of nature. He sees the "transcendentalising" of God and the "process of alienating values from nature" as forcing human culture to develop its own realm, as a mixed blessing (Evanoff, 1992). In this case, all value is located *outside* the world, in God, and nature is viewed as valueless.

Plotinus has a clear answer to this problem, as we have seen. In addition, it can also be argued that the scientific arguments I have cited, based as they are on ecology, can equally be supported on metaphysical Plotinian grounds. But the science-based arguments have the advantage of being philosophically defensible thus possibly more convincing to those who may have a problem with metaphysical or religious arguments.

But a serious problem remains, that is, the defense of the step from the intrinsic value of nature, whatever the grounds for its support, to the moral obligation arising from such value. Paul Taylor uses the inherent value of non-human organisms to ground the attitude of "respect for nature," and goes on to show the formal conditions that must be present "for any set of rules and standards to constitute a valid normative ethical system." They must be, a) a general in form; b) must be considered applicable to all moral agents as such; c) must be intended to be applied disinterestedly; d) must be advocated as normative principles for all to adopt; and e) must be taken as overriding all non-moral norms (Taylor, 1986).

Holmes Rolston III argues that our view of nature is "filtered through our conceptual framework, hence it must be based on a metaphysic." Value, in turn, is not "imposed on an ecosystem, it is discovered there." He says:

Yet ecological description generates this valuing of nature, endorsing the systemic rightness. The transition from *is* to *good* and hence to *ought* occurs here; we leave science to enter the realm of evaluation, from which an ethic follows. The injunction to maximize the ecosystem's excellence is ecologically derived, but it is an evaluative transition (Rolston, 1986).

I have accepted this argument as well as the position Rolston takes, that is, that an "is" represents a *limit* to any "ought" whatever, and I have defended the reasons for my agreement elsewhere (Westra, 1994). In brief, I believe that *all* purely interhuman moral theories, *also* rely on what *is*, tacitly or explicitly, in support of their arguments. It is because we *are* capable of pleasure and pain that the utilitarian can argue *universally* for the greatest "good," if we were not, the argument could not be used in the same way. Similarly, the Kantian imperatives rely on the fact that we *are* rational beings. In both cases, what we *are* does not imply what we ought to do. But the recognition of the "is," *pace* Hume, provides the limit for what we ought to be and underlies the possibilities this ought implies.

Environmental norms acknowledge the consequences of a deepened grasp of the natural realities and their functioning and processes; further, when they *also* meet the criteria proposed by Taylor for appropriate moral norms, they can be supported philosophically. Evanoff argues that it is the religious component present in Plotinus, that will serve us best to return to a position of respect for nature. Many who support intrinsic value in natural entities and wholes are prepared to accept some metaphysical belief and principle. I have taken an Aristotelian approach in my defense of environmental ethics principles that can be based on the value of integrity, and I have used the concepts of causality and of truth, and raised the question of origins (Westra, 1994).

From a Plotinian standpoint, nature is good and the locus of value; the obligation arising from the good is based primarily on its Source and origin, and on our place within the universe, hence it is based on Plotinus' metaphysics, not his ethics. From a scientific standpoint based on complex systems theory and post-normal science, intrinsic value is present in both individual entities and whole. The individuals' value is based on their spontaneity, freedom and the role they play in the life support function of

natural wholes. The latter derive their own value precisely from that function and their life-support capacities.

It is fair to say, with John Rist, that in general the natural world did not represent an issue for the Greeks (Rist, 1997), just as "the problem of the commons" was not an issue for John Locke (Hardin, 1968; Hargrove, 1989). Thus we cannot expect specific environmental guidance from either Ancient or Hellenistic philosophy, although recent scholarship has indicated interesting resonances between the Ancients and environmentalism (Westra and Robinson, 1997). Nevertheless, for most of these thinkers the natural world had real intrinsic value for metaphysical, rather than prudential grounds, whether or not humans were ready to acknowledge this value.

This is eminently true of Plotinus's philosophy, as this brief discussion of some of the key elements of his doctrine has indicated. It can be argued that this metaphysical understanding provides a solid locus of goodness and value, parallel to the one provided by modern scientific considerations, taken from both biology and ecology. For both, the importance of *hybris* and the necessity for limits to human activities can be derived and supported.

# **Commonality and Difference Between Neoplatonism and Deep Ecology**

**David R. Lea**

Various environmental N.G.O.s and Green political movements have come to prominence in recent years and have found their philosophical and intellectual spokesmen/women with the emergence of environmental ethics within academic philosophy. Environmental ethics divides between so called deep ecology and shallow ecology. What I shall endeavor to do in this paper is criticize deep ecology through a comparison with Neoplatonism. The ethics of sustainable development has been seriously challenged by so called deep ecology which calls for a much more radical ethical approach.

So called shallow ecology, in which one locates the concerns for sustainable development remains rooted in the anthropocentric attitudes toward nature, or so "deep ecologists" claim, as it sees nature as receiving value through human ends and purposes. On this view nature must be preserved not for its own sake but rather so that it will continue to satisfy human needs and aspirations through future generations. Shallow ecology, because of its anthropocentric bias is alleged to promote an instrumental approach to nature. In contrast, the various positions of the "deep ecology" reject the anthropocentric position for the bio-centric. They argue that non-human phenomena merit the same consideration that Kant thought should only be extended to rational beings.<sup>1</sup> In order to effect this end we need to divest ourselves of the anthropocentric framework and see nature from the non-anthropocentric biocentric perspective.

The question to be considered in this paper is whether deep ecology offers a coherent basis for human ethics. Through a contrast of the deep ecologist's approach to nature and that of the earlier Neoplatonist, I demonstrate that the deep ecologist's

attempted non-anthropocentric approach offers an incomplete and perhaps incoherent narrative, because it seeks to avoid human purposes and interests. As ethics is essentially an evaluation of the telic dimension of human experience, deep ecology cannot succeed in grounding normative systems, whereas Neoplatonism does.

### I. The Application of Deep Ecology

The convictions and motivations which have fueled our destructive activities are more specific failings which have a great deal to do with the ways in which we treat other members of humanity. Indeed if it were the case that humanity were properly anthropocentric in its thinking such that we did universally attribute intrinsic value to all other members of the human race (in accordance Kant's categorical imperative), then there would exist powerful moral constraints on the most significant forms of environmentally destructive behaviour. Firstly, it would no longer be possible to sustain our present economic system which regards the impoverished sections of the third world as a mere source of labour and natural resources to be utilized in the production of the goods and services to satisfy the ever expanding demands of the West. If the West were really to treat these people as having intrinsic value, as ends in themselves, then we would have to relax our demands upon their labour and resources and reassess our policies, and inevitably this reassessment, in accordance with Kantian principles, would not find in favour of our present economic system. Secondly, the growing militarization through the growing military economy would have to cease since the infliction of this form of harm on the civilian populations and the environment can only be sustained by attitudes which regard other human beings and foreign peoples and nations as significantly failing in humanity, and in any event, having value which is inferior to our own communal or national goals, aspirations or "interests."

If anything the thinking of the Renaissance, Reformation, and Enlightenment, encouraged by the growth of science and modern technology, demanded active engagement in the transformation of nature. But this philosophy has been undermined not so much by new moral sensitivities like "deep ecology," which teach the non-instrumental value of nature, but rather through an appreciation of

the fragility of nature and her ecosystems, our own natural and precarious dependence on these systems, and the unforeseeable nature of the consequences of our own activities. Ultimately these sobering realizations have dashed all hopes of the enlightenment dream which sees the world radically transformed through science to create an environment exclusively accommodating human needs, leisure, comfort and creativity.

What, therefore, is the intellectual position which deep ecology confronts if Western science and philosophy have already recognized the empirical impossibilities of the enlightenment program for the transformation of the world? I suggest that one possible opponent is the lingering Enlightenment conviction that human beings have a sovereign status in the universe based upon their supposed unique capacity for rational thought and action. This is the belief that human beings alone have intrinsic value, which finds renowned expression in Kantian pronouncements which declare the rational human will to be an end in itself. Even though empirical realities have worked to disconnect the notion of inherent human value from activist prescriptions to change the face of nature, belief in the ultimate value of human beings does remain a vestigial remnant inherited from an age when human beings grew to recognize their own unique qualities, rational powers, and abilities to utilize nature for their advantage. In other words, this was the enlightenment dream of the seventeenth, eighteenth and nineteenth centuries before the twentieth century taught us to accept the awful limitations on those powers.

But one wonders if the message of the "deep ecologists" is really particularly prescient if they are simply asking us to disregard this final inheritance of the enlightenment, the belief in man's superiority to the rest of the created order, since it is no longer the case that these beliefs connect with the conviction that human superiority will enable us to transform nature into a human utopia. Wherein, therefore, can we hazard the value of deep ecology lies? Undoubtedly its proponents see themselves as carrying through a revolution in ethical thought whereby Kantian moral theory has been expanded so as to offer more comprehensive and thorough ground for our ethical experience. It might be alleged that deep ecology has laid the intellectual framework which will allow our normative systems to respond adequately to our growing awareness of various environmental concerns by the very fact that

it *does* expand the class of the intrinsically valuable to include not only human agents but also natural phenomenon, including the order of nature herself. If this is the essential point of the deep ecology manifesto then the question thereby posed is whether deep ecology really represents a revolution in our moral attitudes. In the course of this paper I argue that deep ecology adds no new insights concerning man's importance in the universe, and when used as the basis for ethical response offers a very incoherent program, and moreover does so in such a way which fails to satisfy certain fundamental moral concerns. In order to illustrate these points let us now turn to consider the cosmological vision which preceded the advent of Renaissance humanism.

## II. Neoplatonism

Deep ecology which purports to reinvest value in the natural order may be seen as consistent with other contemporary a post-modernist critiques in its rejection of Renaissance humanism and the discourse of the enlightenment. But on a superficial level this re-interpretation has many affinities with Neoplatonism. One very important common theme which dominated much of Humanist and Enlightenment thinking was the idea that man stood superior to the natural order and could ultimately dominate and transform the environmental arrangement in a positive way. The idea that man has sovereignty in the created universe begins perhaps with Ficino, and with the advent of the reformation this sovereignty acquires responsibilities to work and transform the earth, ultimately generating the notions of Marxian and similar utopias in which nature is rationally transformed to meet human specifications and needs. But though deep ecology may represent the abjuration of the Enlightenment notion of human centrality, the Renaissance and the Enlightenment themselves, stand together as intellectual rejections of earlier philosophies which taught that the cosmos was inherently valuable and consisted of multiple gradations of superiority in which humanity's place within this scheme was not the highest.

Anders Nygren points out that the religious cosmology of the Middle Ages *exhibits* a domination by the simple pictorial scheme of the Alexandrian world scheme.<sup>2</sup> According to this scheme the cosmos exhibits motion in two directions—the procession of

everything from God to levels of lesser perfection toward the material world and then a returning ascent from the material and lesser realities towards the higher spiritual levels and ultimately God himself. The latter movement was seen to originate in eros, the love of the greater spiritual reality which engenders a desire to possess this higher reality. The Alexandrian world scheme was a creation of the Neoplatonists derived in turn from the Hellenic tradition, specifically the Platonic doctrine of the Two Worlds, the world of ideas and the material world, and the Aristotelian notion of the ladder.<sup>3</sup> At his/her highest level of activity, at the apogee of intellectual development, Aristotle saw man abandoning his material concerns, and the deliberations of practical reason, and achieving a contemplative relation with the ultimate spiritual reality of the unmoved mover.

The Alexandrian world scheme of the Neoplatonists understood the created order to consist of higher and lower forms of creation in which one's status was dependent upon participation in the higher forms of goodness, beauty, intelligence, harmony etc., as opposed to immersion in the lesser reality of material existence. The angels and the stars, for example, existed at the highest stages of perfection since they were entirely purged of the material dross. Man whose existence was clearly immersed in the material world could hardly claim any superior status in this scheme, though he could work to turn away from these material interests, and through contemplation of the higher realities, approach some form of union with the "one," his transcendent source.

Seen in this light Neoplatonism can be viewed as an important part of the ontological grounding of Medieval Christianity as it offers a cosmic vision which renders comprehensible the ethical tendencies of Medieval Christianity. Specifically it serves to make understandable the ascetic and other worldly proclivities of this morality when compared to the subsequent normative tendencies of the reformation and post reformation.<sup>4</sup>

But aside from normative implications, the idea that man had an intrinsic value which outweighed that of other created existents had no place in the Christian thought of the Middle Ages. The ideas of the Renaissance humanists which attributed this superiority to human beings must themselves be interpreted as a rejection and the negation of this medieval ideology. The question to consider is whether the view of the deep ecologists, which attributes intrinsic

value to non-human phenomena, in fact, offers an intellectual contribution which is superior to the Medieval views derived from the Neoplatonists. In order to answer this question we need to underline the similarities and differences between Deep Ecology and Neoplatonism.

### III. Similarities and Differences Between Deep Ecology and Neoplatonism

Like the deep ecologists the Neoplatonist saw profound value in the harmony, beauty, intelligible unity of the natural order. They did not, however, use this experience as the basis to formulate any practical behavioural attitude towards "nature." But in similarity to the deep ecologists they did attribute great importance to the reality of species and the holistic unity of system as opposed to ontology and etiology based on distinct member components. In an important sense, the Neoplatonist also believes in the efficacy of holistic relations rather than a mechanistic world of distinct efficient causes. For example, Plotinus taught that by means of the Soul the sensible world is ontically effected through the generation of order and systemic proportion. With respect to the content of this cosmic circuit, Plotinus speaks of a system with a purpose in which everything has "its coordinate place" (*Enneads* IV.3.12).<sup>5</sup> In this reality the individual soul must adapt itself to the "times and seasons" dictated by the cosmic circuit.

Similarly with respect to species the Neoplatonist also supports the ontic distinctness of species seeing species as determinate existents distinct from the subjective belief systems of human beings. In addition to the World Soul, and the individual souls there are species souls which are said to be Intellectual originals. Each soul is attached to its own Intellectual original. "...they have chosen the way of division; but to the extreme they cannot go; thus they (the souls) keep, at once, identification and difference; each soul is permanently a unity (a self) and yet all are, in their total, one being" (*Enneads* IV.3.5.) Each soul is identical with all others of its kind in the species or species soul which is a distinct unitary being.<sup>6</sup> The ideas or intellectual forms of different species are thereby realized through the species soul in particular instantiations

and thus Neoplatonism similarly affirms the ontic significance of species.

But also with respect to the experiences which ground the two systems there appear to be striking parallels. If we enquire as to the source of this belief which sees nature as having intrinsic value in itself, the deep ecologist often points to a contemplative relation with the natural world. Although not strictly a deep ecologist, Holmes Rolston III, a leading figure in environmental ethics states, "We take ourselves to nature and listen for its forms of expression, drawn by a realm of values not of our construction. We ought not to destroy this integrity but rather preserve and contemplate it."<sup>7</sup> An environmentalist like Rolston also believes that the valuing experience is not identical with the intellectual representation of facts or the calculations involved in discursive thinking. Valuing, he says, involves an internal excitation in which "...the marriage of the subject to its object gives birth to value."<sup>8</sup> It is indeed easy to see the experience of which Rolston speaks as being very proximate to the ultimate mystical experience of the One of which Plotinus spoke. As in the valuing experience, described by Rolston, Plotinus refers us to an ultimate experience in which there is a form of union of the human soul with its ultimate source, the One. As we all know this is not achieved through discursive reasoning or intellectual activity; it is an experience beyond intellection which involves the union of the subject with its supreme contemplative object. The principal difference, of course, between the two positions, is that Rolston is speaking of an experience of nature in which there is a marriage or union of the human subject with nature as its object. On the other hand, Plotinus refers to the union of the human subject with the ultimate source of nature herself, value, symmetry, beauty etc. However, the difference may not be all that significant, Plotinus saw the harmony, order, beauty of nature as indicative of the source which generated and maintained the reality of the natural world, that is to say, an ultimate experience of the creative force behind and beyond intellectual principles and the changing panorama of the natural world. In this secular age an environmentalist would avoid such claims to some form of experience of the Divinity in Nature so as not to alienate agnostics and atheists who might otherwise be sympathetic to the environmentalist cause. However, Rolston intimates his sympathy with this position in his description of the experience of nature as

"...a positive aesthetic experience—one that often leads toward religious experience."<sup>9</sup> In other words, for the modern environmentalist, the foundation for our obligations to the land, the ecosystems and the biosphere, is rooted in an experience which is in a strong sense mystical and very much similar to experience of which Plotinus speaks.

Overall one observes that like the deep ecologist, the Neoplatonist recognizes that harmony, intelligible unity and even integrated beauty of nature which, through its systems, "protects, regenerates and reforms" and creates diverse living phenomenon (species) with their own unitary roles and tendencies. But on the other hand, Neoplatonism and deep ecology exhibit great discrepancies with respect to the conclusions which are drawn from these similar experiences. The deep ecologist concludes that we are under a duty to preserve these intrinsically valuable states of affairs and this is a conclusion which a Neoplatonist would not be prepared to draw. The Neoplatonist's reluctance to follow these sorts of prescriptions appears well considered if we look at the problems inherent in the deep ecologist idea of "preserving intrinsically valuable states of affairs."

#### IV. Intrinsically Valuable States of Affairs

The fundamental problem for the deep ecologist is the very multiplicity of phenomena which can be regarded as intrinsically valuable. Because the number of indwelling valuable states of affairs is transitory, vast and complexly ordered through hierarchical relations—which we incompletely understand—there can be no consensus as to an effective practical course of action, and worse still anthropocentric subjectivity creeps into the selection of possibilities. Thus we receive a dismaying panoply of diverse, overwhelming and sometimes conflicting instructions. For example, J. Baird Callicott tells us to preserve the "objective harmony of the biosphere as a whole,"<sup>10</sup> John Rodman tells us that we ought to respect anything which has a "telos,"<sup>11</sup> Paul Taylor respects all forms of "life," while Tom Regan preaches protection of "non human animals who are subjects of life."<sup>12</sup> It has been pointed out by a critic of environmental ethics that in order for ethics to be viable it must be among other things "non-vacuous" and

"decidable" for an ethic cannot be prescriptive if all systems and individuals are of equal intrinsic value, nor can it be practical if it cannot solve ethical dilemmas and dictate what is of value and what is not.<sup>13</sup> These are problems which dog the ethics of deep ecology.

Unfortunately, the living entities and other states of Affairs to which we are to attribute intrinsic value are overwhelming vast and demand some form of anthropocentric decision making if we are to act consistently. This is because as another critic recently pointed out, "an ecocentric or biocentric perspective delivers no determinate answers as to which of the abundant and wonderfully various unfolding planetary biotas should be preferred."<sup>14</sup> Action grounded on the perceived intrinsically valuable is in itself insufficient for one simply cannot consistently act in such a way as to preserve all perceived intrinsically valuable states of affairs. For example, if one acts in such a way as to preserve all non-human animals this may undermine the ecosystem and other species; if one acts to protect the ecosystem this may require the destruction of individual animals; if one respects all forms of life or anything with a telos this may mean respecting the virus which causes A.I.D.S. which may destroy our own species etc.<sup>15</sup> An appreciation of the beauty, harmony, diversity of the natural environment does not appear to entail any consistent ethical course of action, without the introduction of further criteria and these criteria will tend to carry anthropocentric bias as when we feel free to disregard the viral autonomy of the A.I.D.S. virus when it conflicts with our interests. I will argue later that anthropocentric perspective is not only unavoidable in ethical decision making it also essential as I will demonstrate through consideration of the Neoplatonic perspective.

Beyond the problems of consistency, vacuousness and decidability, there is also the problem of deriving a duty of care from these experiences. Ultimately, the deep ecologists have intuited a profound value in nature in terms of harmony, beauty, balance, intelligible unity, holistic integrity etc. and sought to go beyond these experiences to ground a prescriptive and proscriptive normative system. But though as Tom Regan points out,<sup>16</sup> it may be true that one sees the sunset as beautiful why should I respect it, and what set of practical obligations would follow from this experience?

But moreover there are fundamental conceptual problems with the very notion of "states of affairs." "Deep ecologists," inspired by G.E. Moore, have argued that our ethical positions should be derived from states of affairs which are seen to have intrinsic value so that we are under a duty to maintain these states.<sup>17</sup> Among other things deep ecologists desire that we acknowledge a duty of care towards not only individual non-human existents but also ecosystems and species. Ecological systems and species, however, possess meaning which cannot be reduced to mere "states of affairs." Holmes Rolston describes an ecosystem as that which "...projects and protects, regenerates and reforms all these member components in biotic community."<sup>18</sup> With respect to species G.G. Simpson asserts "An evolutionary species is a lineage (an ancestral-descendant sequence of populations) evolving separately from others and with its own unitary evolutionary role and tendencies."<sup>19</sup> These are conceptual descriptions which are not adequately captured by the term "state of affairs," or as Tom Regan points out, environmentalists wish to attribute value in a holistic manner but, "Sustainable, diverse and balanced systems of life are not states of affairs any more than species are."<sup>20</sup>

Furthermore, by emphasizing intrinsically valuable states of affairs, deep ecologists stand in danger of undermining the ordered unity of nature they are committed to protecting. For example, one cannot consistently maintain that individual members have intrinsic value, and should be treated as ends in themselves, and maintain, as many environmentalist wish to, that reducing the surplus numbers of an overpopulated species is justified to maintain ecological balance, as when one advocates hunting wild animals (for example, deer) to cull their number in order to promote the stability of the ecosystem. Conversely, emphasizing the importance of balanced systems, and functional relations which define ecosystems and species, devalues individual members and components so that it is impossible to maintain the notion that non-human individuals possess intrinsic value.

This point, I believe, underlines the difficulty. The experience of "nature" as harmonious, holistic and balanced points not entirely to the transitory embodiments of these qualities but also to an intelligent unifying power or force which endures independent of any given state of affairs—that which "projects and protects, regenerates and reforms." For example, a given ecosystem may

prove to be unstable and die out yet there will be a reformation and a new one will emerge. There are also the effects of ecological succession, the process by which the structure of the biological community, with respect to both niche structure and species structure, alters as a result of the species modification of habitat. As happens most often in the case of dominance of one species within an ecosystem, this process ultimately renders the habitat unfit for the dominant species, yet a new habitat is thereby created which will support new and diversely different species. Thus, it seems absurd to attempt to preserve and maintain given states of affairs, as nature herself is a dynamic system in which given members die out and situations constantly alter, yet the living force, which resolves and brings forth these rich concatenations, endures and constantly reinstates new conditions and new member components.

Neoplatonists in contrast did not linger with the natural phenomenon which are the expressions of this life giving force but sought to go beyond instantiations to the transcendent source of these enduring qualities. In contrast, the deep ecologist remains transfixed on the individual phenomena which carry these qualities and tries to tell us that we should preserve the transitory states of affairs which exhibit these qualities. This is precisely where the deep ecologist runs into trouble.

I say this because first of all the experience of this value in nature confounds rational choice when it is made a basis of practical action. Without anthropocentric guidelines one is confronted by diverse and conflicting courses of action, and moreover, fixation on "valuable states of affairs" denies the unifying source or power which exists independently of particular instantiations.

## V. Beyond the Rejection of Anthropocentrism and "Detached Science"

To this point we have underlined that Neoplatonism, unlike deep ecology, does not explicitly attempt to prescribe or proscribe definite forms of social organization. In contrast, deep ecology explicitly intends its articulations to function as guides to appropriate societal norms including social and economic

arrangements. However, despite this reticence it has been historically the case that Neoplatonic theory offered powerful theoretical support for Medieval Christianity and its ethical teachings. In the subsequent pages I argue that, in fact, Neoplatonism does offer a superior theoretical basis for deriving moral positions, a basis which is perspicuously lacking in the articulations of the deep ecologists, and that this advantage is linked to an understanding of the cosmic order which does not defenestrate anthropocentric concerns.

As we have said, one view of modernism which the deep ecologist denies is that Man is the centre of the universe. But the other aspect of modern thought which deep ecology also rejects is the detached attitude of scientific enquiry which refuses to invest value or meaning in natural phenomena. In part what we mean by the detached nature of modern scientific understanding is the belief that our understanding of nature must be value free, and concomitantly, a central tenet of modern scientific enquiry is the notion of objective detachment. Despite the fact that deep ecologists believe that the moral advantage of a position which invests intrinsic value in the natural world is to be found in an implied non-instrumental attitude, in fact, the premises of pure science enjoin an initial parallel non-instrumental approach. As a precondition of its investigation, detached scientific enquiry demands an uninvolved observer, one whose desires, expectations, preconceptions do not enter into or otherwise prejudice the enquiry, though ultimately the product of these enquiries may be used to satisfy these varied goals of human agency and predilection. As Charles Taylor states, "Science could only be carried on by a kind of asceticism, where we discipline ourselves to register the way things are without regard to the meanings they might have for us."<sup>21</sup> The notion of the purely scientific enquiry is, in fact, the ideal of the non-anthropocentric, an enquirer who divests from himself of all human concern and feelings of value for the object of study, whether instrumental or otherwise.

This, of course, is consistent with the ruthless quest for scientific knowledge with its unconstrained probing and experimentation. The idea that natural phenomenon have intrinsic value or any value can be an unacceptable hindrance to the study of phenomena as it is made ruthlessly subject to altering variables of pressure, temperature, division, fission and fusion etc. This

explains, in contrast, why the human sciences are much more constrained in methodology and must approach their topics in a much more gingerly fashion since, in accordance with Kantian premises, they must regard human life as having some sort of intrinsic value. On the other hand, the natural sciences could hardly have ever made their great advancements if one approached nature as sacrosanct repository of intrinsic values.

But strangely enough deep ecology does indeed seek to promote a very similar non-instrumental approach, but it seeks to avoid instrumentality by an alternative method, that of advancing an egalitarian unity of species with no special place for human beings. In doing so, it denies the position of traditional detached scientific enquiry which sees nature bereft of value, proposing instead, that it is the repository of equivalent intrinsic values. In this light deep ecology, in commonality with the scientific approach attempts to purge the anthropocentric, but at the same time, it operates as a fundamental reaction to the ideal of scientific detachment, which refuses to attribute value to the natural order.

However, deep ecology is not the first philosophy which regarded nature as exhibiting intrinsic values. In fact, the ideal of scientific detachment replaced an older view which according to Charles Taylor did not separate understanding the universe and the project of what he calls "attunement with the universe."<sup>22</sup> As Taylor says, the older view involved first of all seeing man as having an end or telos. Humankind's proper end was inseparable from one's proper place in the meaningful order of the universe. According to the most important philosophies of the classical period, especially Aristotelianism, Platonism and Neoplatonism, this order was to be discovered through the application of human rational nature. In Western civilization the latter view predominated until the seventeenth century and the advent of modern Western science, when the idea that the goals of human existence were revealed in the inherently valuable order of the universe became incompatible with the methods and goals of scientific progress. As Charles Taylor states "...the breaking of the connection between understanding and attunement was an essential part of the modern revolution in science. The conception of the universe as meaningful order, as a possible object of attunement, was seen as a projection, a comforting illusion which stood in the way of scientific knowledge."<sup>23</sup> The advancement of science thus appeared to require

that one first separate out the questions of human meaning and purpose from study into the nature of natural phenomenon. But in doing this, we defenestrated both the conviction that the natural order was itself inherently valuable, together with the idea that the purposes of individual human existence were revealed through an understanding of this valuable cosmological order. In itself the natural order was not regarded as valuable or revealing as to the purposes of human life, it was simply an object of study in which understanding occurred independent of these concerns, an object of study with the sole purpose of technological advance.

Does deep ecology in fact simply return us to this older view by reinstating the notion of inherent or intrinsic value of the natural order<sup>24</sup> or does it offer a further advancement? In fact it effects neither possibility. It sees the natural world as being intrinsically valuable, yet it fails to articulate an explanation of this intrinsic value which links to an understanding of the nature of human beings with their proper end or telic goal within this order. As we have pointed out, the classical view, illustrated perhaps best in the philosophy of Neoplatonism, necessarily includes in the definition of the natural order an indication of man's proper role and place within an encompassing meaningful order. This failing on the part of deep ecology in terms of lacunae again is essentially traceable to the premise that human interests and ends must be abstracted from a fundamental appreciation and understanding of the natural environment—the fundamental proscription against anthropocentrism.<sup>25</sup> In contrast, the articulations exemplified in Neoplatonism function both as an enquiry into the nature of human beings and consequently their appropriate ends, and the inherently valuable universe in which one is placed, and the two are not distinguishable projects such that either project could be accomplished independently of the other. In understanding and appreciating the cosmological order, we also come to understand the ends and purposes of human beings, and so receive important answers to a central concern of moral existence. Humanity maintained the connectedness of these concerns until science separated the notion of understanding the natural order from that of recognition of humankind's meaning and role within this order. In contrast, the view of the deep ecologists falls into the trap of merely iterating the scientific principle that we approach nature through disregarding desires, goals and ends of human beings and thus like

an all embracing scientific outlook, this attitude can undermine the grounding of any meaningful normative system regardless of the novelty of the original axiological conclusions.

If we are to state the issue in alternative terms we might say that the central problem for both deep ecology and pure science can be traced to the fact that both systems find themselves impaled on the horns of the dilemma created by the Cartesian metaphysics which accompanied the scientific advance of the sixteenth century, and from which contemporary philosophy struggles to escape. In effect, Cartesian philosophy formally articulated a position consistent with the implicit methodology of scientific enquiry which strived to separate subjectivity from the ideal of objective understanding. Cartesianism states that the subject and object must be separated as they represent distinct realities such that principles applicable within one realm are inapplicable with respect to the other. Thus the so called "modern" period has been burdened with the task of fusing together the disparate realities consisting of conscious subject and external object in order to effect a complete picture of the world and the cosmic order. Science, for example, despite its spectacular successes, proves to be unsatisfactory for the very reason that it so clearly refuses to effect a fusion because of its preoccupation with the "objective." As one postmodern commentator states, "Scientific explanations are themselves interpretations of a sort, ones, however, which have the particular characteristic in that the human subject or the author of the discourse does not show."<sup>26</sup> Natural science's spectacular success depended upon ignoring the human subject by delimiting and rejecting all issues of value, preference, and interest, emanating from the subject, but so fails to offer any insight into the condition of the human subject who finds himself confronted by this objectivity. Unfortunately deep ecology suffers from a very similar incompleteness in that it believes that the intrinsic value of the objective world can only be approached if we remove all reference to the human subject with its particular interests, projects and its value giving and creating activities. Thus deep ecology also offers a description of the world which can never be a complete description because the human subject is missing. Science confronts the subject/object distinction and seeks to remove the valuing subject in order that it can better objectify the objective, while deep ecology seeks to purge subjectivity from value

judgements by also denying the creative, valuing and value giving activities of the subject, while striving hopefully to objectify value in the external object believing that this can be achieved through the removal of the human subject. But in attempting to reinvest value in the objective, deep ecology does not leave us any better off than science because it fails to offer a full account of both our own valuing activities and the value which we perceive in the objective world of nature.

Neoplatonism, in contrast, achieves a greater completeness because it does not insist upon the distinctness of the human subject and the external world because the fundamental principle of reality applies equally to both human subject and external nature. The "Reason Principle" which Plotinus states the human subject possesses at the summit of its being (*Enneads* I.1.8) is the same principle by which the Soul brings into actuality the external world of nature, (*Enneads* II.3.16). In the act of intellection we realize the characteristic act of our human soul and at the same time experience the Act of the intellectual Principle upon us, (*Enneads* I.1.13). The idea of the distinctness between knower and known is thereby an illusion. As Plotinus states, the Intellectual or Knowing Principle must be one and the same with that which knows of the knowing, (*Enneads* II.9.1). The Intellectual Principle which orders and forms the natural world is thereby active with respect to the human subject and the realm of external nature. Through intellection the human subject maintains his link with the Intellectual Principle—the fundamental principle of natural reality, and the human subject achieves his excellence through association with the higher principle (*Enneads* I.1.8).

In his system Plotinus goes beyond science and deep ecology in that he offers a full account of the human condition recognizing that the so called objective world must be seen as intrinsically valuable and must include an account of the valuing subject who is intimately connected to the cosmic order and who is understood to have a proper and specific place within this order.

To expand on the last point we touch upon conclusions reached by Alistair McIntyre, but also in similar ways by Charles Taylor and Michael Sandel. McIntyre locates the essential failure of modern moral philosophy in this very refusal or failure to articulate the proper goals and purposes of human life. What Neoplatonism does offer, and what deep ecology does not, is an indication as to

how the individual can realize his own nature in terms of his own good. A complete ethics must according to Alistair McIntyre give an account of the qualities necessary to achieve: 1) the goods internal to practices; 2) qualities contributing to the good of the whole life; 3) an account of their relationship to the pursuit of the good of human beings.<sup>27</sup> Certainly deep ecology espousal of non-anthropomorphism elides issues 2 and 3 and in its present general undefined state can offer no direction as to issues relating to 1.<sup>28</sup>

To be fair, however, some environmentalists have recently recognized this problem and some have pointed out that the discernment of a cosmic purpose for ecosystems and all beings including human beings, is essential to the success of a viable environmental ethic. One author has recently alleged that stumbling blocks to success have been this failure on the part of deep ecology to offer a vision of cosmic purpose in which human beings play a unique role. He states, "...if the question of cosmic purpose can be taken up once again, we may be on the verge of achieving a novel vision of the greater nature in which all beings have a value in themselves and as part of quickening genesis."<sup>29</sup> This refusal to entertain issues relating to the special goals and purposes for human beings within the unfolding and development of the cosmos will, I believe, continue to militate against any wide acceptance of deep ecology. Environmental ethics cannot advance until it defenestrates the notion that ethics can be based on notions of non-anthropocentric value. So long as the environmental ethics of deep ecology delimit these areas as an inappropriate subjects of discussion, it can really offer no ethical advance on non-axiological scientific theories of nature.

Of course, in some ways deep ecology is not alone in this failing. McIntyre has pointed out that at least since Hume, moral philosophers have attempted moral theories which avoid addressing the issues of the nature of human beings, their proper good and telos, etc. However, deep ecology is different from the others in that it attempts to reinstate the idea of the value of the natural order, but without providing adequate answers as to the role of the human being within it answers, which address issues of the individual and humanity's own natural good. It fails in the latter respect because it pronounces that the latter should not be the concern of ethical theory, but in doing so it offers a theory which can never be completely satisfying or even adequate. Indeed if

McIntyre is correct in holding that an ethical theory lacks substantive moral content if it does not address these issues, then it may well be the case that though deep ecology has offered new axiologies, these are in the nature of the aesthetical rather than the ethical. Ultimately it is the suggestion of this paper that a return to the Neoplatonic thought will allow us to rediscover the lost possibilities which connect individual human existence with a comprehensive view of nature and non-human reality, connections which are missing from the stale discourse of scientism or the radical rejection of anthropocentrism embraced by deep ecology.

13. Janna Thompson, "A Refutation of Environmental Ethics," *Environmental Ethics* 12 (1990):147-160, similarly concludes that environmental ethics, among other things, cannot satisfy the requirements of any viable ethical system in that it is "inconsistent" which is to say that it cannot dictate which similarities and differences are relevant and why. Also it falls short with respect to further requirements. She argues that successful ethics must be "non-vacuous" for an ethic cannot be prescriptive if all systems and individuals are of equal intrinsic value, thirdly, it must be "decidable" since it must solve ethical dilemmas in order to be practical and it cannot do so if it is unable to dictate what is of value and what is not.

22. *Ibid.*, 142-145.
23. *Ibid.*, 143.
24. Environmental ethics often distinguishes between "inherent" and "intrinsic" value. Bryan G. Norton, "Epistemology and Environmental Values," *Monist* 75 (1992): explains that advocates of "intrinsic value" believe that natural objects have value entirely independent of human consciousness. According to this theory, the value in nature existed prior to human consciousness and it will continue to exist even after human consciousness disappears. On the other hand, those who see "inherent value" in nature see nature having value that is independent of the values and goals of human valuers, it is not merely instrumental to human ends, but this value is attributed by conscious valuers, either human or otherwise. J. Baird Callicott advocates inherent value of nature in which nature is valuable for its own sake, but is not valuable in itself, that is, independent of human or other valuing consciousness

(see J. Baird Callicott, *In Defense of the Land Ethic: Essays in Environmental Philosophy* (Albany, NY: State University of New York Press 1989), 163.

25. In fairness to the movement, however, it must be pointed out that some environmental ethicists, for example, Eugene Hargrove ("Anthropocentric Intrinsic Value," *Monist* 75 (1992): 181-207) and John O'Neill ("Varieties of Intrinsic Value," *Monist* 75 (1992): 119-137) recognize that one cannot really base ethics on non-anthropocentric intrinsic value but argue that this does not imply that all value must be instrumental. O'Neill particularly argues for an Aristotelian approach in which it is argued that the flourishing of many other things ought to be promoted because they are constitutive of our own flourishing which includes the idea that we value things for their own sake. Also A. J. Fabel "Environmental Ethics and the Question of Cosmic Purpose," *Environmental Ethics* 16 (1994): 303-314, has recently argued that we must reintroduce the idea of cosmic purpose and humanity's role within that purpose. However it does remain that the leaders of the environmental movement, for example, Holmes Rolston III (*Philosophy Gone Wild* and *Environmental Ethics: Duties to and Values in Nature* (Philadelphia: Temple University Press, 1988), Paul Taylor (*Respect for Nature: A Theory of Environmental Ethics* (Princeton NJ: Princeton University Press, 1986), and J. Baird Callicott (*In Defense of the Land Ethic*) have struggled to maintain the notion of non-anthropocentric value.

27. Alistair McIntyre, *After Virtue* (London: Duckworth, 1993), 273.
28. Janna Thompson, "A Refutation of Environmental Ethics," points out that environmental ethics cannot satisfy the requirements which any ethical system must satisfy because: 1) it is inconsistent because it cannot dictate which differences and similarities are relevant and why; 2) it is vacuous because all individuals and systems are granted equal intrinsic value and therefore it cannot be prescriptive if all individuals or systems are of equal value; 3) it must be decidable, it must be able to dictate what is of value and what is not in order to solve ethical dilemmas, for if it is not decidable it is not practical.

## Neoplatonism in Transpersonal Psychology: The Thought of Ken Wilber

Daniel Kealey

Transpersonal psychology emerged as a discipline in the early 70's. *The Journal of Transpersonal Psychology*, initiated in 1973, declares in its statement of purpose that it

is concerned with the publication of theoretical and applied research, empirical papers, articles and studies in meta-needs, transpersonal values and states, unitive consciousness, peak experiences, ecstasy, mystical experience, being, essence, bliss, awe, wonder, self-actualization, self-transcendence, spirit, sacralization of everyday life, oneness, cosmic awareness, cosmic play, individual and species-wide synergy, the theories and practices of meditation, spiritual paths, transpersonal actualization, compassion; and related concepts, experiences and activities.

One of the principal founders of transpersonal psychology was Abraham Maslow who also distinguished himself as the founder of humanistic psychology, or "Third Force" psychology to differentiate it from the dominant psychological schools of Freudian psychoanalysis and behaviorism, both of which are reductionistic when it comes to what Maslow referred to as "the further reaches of human nature" (the title of one of his books). Rather than focusing almost exclusively on the pathological or lowest common denominator aspects of mental health and basing a model of human psychology on that, Maslow decided to study healthy, creative, integrated individuals who, as "self-actualizers" and pursuers of "being-needs," were developed beyond the "moral majority" whose lives were centered around the satisfaction of the "deficiency-needs" of survival, security, belonging, and recognition etc. Somewhat to his surprise, Maslow found that self-actualizing

people tended to have significantly higher rates of what he called "peak experiences," and the more focused study of this phenomenon became the impetus for transpersonal psychology's outgrowth from humanistic psychology. These two schools overlap considerably, the difference being that while all transpersonal psychologists embrace humanistic psychology, not all humanistic psychologists embrace transpersonal psychology. Some of the main contributors to this school of psychology are Stanislov Grof, Chogyam Trungpa, Frances Vaughan, James Fadiman, Michael Murphy, Roger Walsh, Daniel Goleman, Roberto Assagioli, Ken Wilber and many others.<sup>1</sup> There is at least one graduate school completely devoted to it, the Institute for Transpersonal Psychology, and several other graduate schools offer programs that are mainly or partly oriented to it. Through the prolific "workshop culture" of the mental health field, transpersonal psychology has extended its influence far beyond the sphere of those who are primarily identified with it.

Ken Wilber stands out in the field of transpersonal psychology as its greatest theoretician. In his many books he displays a phenomenal grasp not only of the entire field of psychology, but of both Western and Eastern philosophy and the social and natural sciences.<sup>2</sup> He has been called the Freud of transpersonal psychology, but his latest book has won him praise as the new Hegel (it's 800 pages long and only the first of three volumes). Wilber refers to Plotinus and other figures of the Neoplatonic line of thought often throughout his writings, and in his latest book, *Sex, Ecology, Spirituality*, explicitly identifies himself as carrying forth this tradition (via Schelling who temporalized Plotinus). In the following pages I will abstract some of the key features of his synthesis.

In *The Spectrum of Consciousness*, Wilber's first book, he develops the theory of a *psychologia perennis* or spectrum psychology, metaphorically likening consciousness to the light and energy spectrum. There are levels of consciousness ranging from the most unified or whole to the most fragmented. Wilber focuses on the block of the spectrum that describes human evolution but makes quite clear that consciousness extends in both directions beyond the human. Ultimately, Reality is consciousness, not in the sense of subjective idealism, but in the sense that ultimate reality, the Absolute, is revealed only in the state of nondual knowing

where it stands out not as an object of a separated consciousness but as pure nondual consciousness, as undivided wholeness. It is thus consciousness beyond subjective consciousness, prior to the primary dualism of subject and object. We are that One, which is the innermost essence of our present consciousness no matter how overlayed it is by bifurcations and repressions that alienate us from primal unity. Here Wilber draws strong support from Vendanta, Mahayana Buddhism and Daoism as well as such Neoplatonists as Plotinus, Eckhart and Nicolas de Cusa.

While neither Wilber nor anyone else can give us the reason why the Absolute involves itself in duality, for reason itself is within *maya* and cannot account for it, we can become aware of how the spectrum of consciousness is generated from "out of" the infinite. Indeed, there is a sense in which we generate the spectrum from moment to moment, as when, quoting from the Lankavatara Sutra, we engage in the process of "reflection by memory wrongly interpreted" in which we mistake our present memory for real knowledge of a "past," thus creating the illusion of real time outside of this present moment. We can become aware of how distinctions arise and obscure their nondual origin. So out of undivided unity consciousness a primal distinction arises. The distinction takes the form of a gestalt or figure/foreground configuration in which the nondual absolute becomes repressed as background and simultaneously there is the projection of duality. "The Primary Dualism, therefore, is actually the Primary Dualism-Repression-Projection. 'Let there be a distinction,' and the non-dual awareness (Absolute Subjectivity) is repressed, thereupon projecting itself as the opposites subject vs. object or organism vs. environment. This general process of dualism-repression-projection is an important one, for it repeats itself numerous times throughout all subsequent levels of consciousness, each time generating a new band of the spectrum and increasing man's ignorance of his Supreme Identity."<sup>3</sup>

Figure 1 (below) diagrams the procession of successive dualism-repression-projections beginning from unity consciousness at the bottom and progressing up through the spectrum.

The Primary Dualism produces space, the gap between the seer and the seen. It also creates time, as we have seen, made acute by the fear of death which arises when we distinguish ourselves from the environment. This Existential level can be brought to awareness

easily by abstracting away personal, social and gender identifications and simply being organismically aware. The transpersonal bands are somewhat more difficult for the average person to become aware of, but awareness of those levels emerge especially in the soul's return to its source.

Fig. 1: Spectrum of Consciousness

*Angst*, or the fear of death, eventually provokes a further dualism-repression-projection within our own separated being. We begin to identify more with the idea of ourselves and thus form an egoic identity that represses the flesh. The diagonal line thus represents our identity boundaries or the locus of the dualism. What's on the left side of the diagonal represents our conscious self, and on the right we find our unconscious or repressed aspects. The particular manner in which the egoic duality is effected depends on such factors as one's linguistic matrix, introjected structures of one's family, cultural beliefs and myths which comprise the Biosocial bands.

The ego, however, is not the impenetrable bastion it sometimes thinks itself to be. It can find itself in conflict with itself, differentiating between its "good" self and "bad" self. One redraws

one's boundaries even more closely in, initiates another dualism-repression, identifying with the good parts of one's psyche and repressing the bad parts, thus projecting the dualism of persona vs. Shadow (in the Jungian sense).

Such fragmentation leads to obvious dysfunction, and healing this dysfunction initiates the return journey towards greater integration. The existence of many different psychological theories, many contradicting each other, can be quite confusing. What type of psychotherapy best addresses my situation? Wilber's spectrum model clarifies this conflict of theories by identifying which dualism any particular form of psychotherapy is addressing. A person with a dysfunctional persona and ego would not be advised, for example, to take up Bioenergetics therapy which aims to overcome the mind/body unity, much less to take up Zen which tells you to forget your ego. Rather a person on the Shadow level of conscious identity would be advised to take up simple, "talk" counseling, the aim of which is to get the client to come to terms with those repressed parts of her own mind which she projects onto other people, causing conflict with them. The aim of this therapy is usually stated to be adaptation to one's social circumstances, which in the spectrum diagram would fall into the healthy persona category.

If, on the other hand, one's dysfunction is primarily neurotic and self-limiting, one would be advised to take up one of the many therapies that are designed to patch up the ego, such as Psychoanalysis, Transactional Analysis, Psychodrama, Reality Therapy, Ego Psychology, etc. A healthy ego is the result of overcoming and integrating the persona-shadow dichotomy. The next category of psychotherapies aim at integrating the ego-body dichotomy. Representative of this level are Rogerian therapy, Gestalt therapy, Existential analysis, Logotherapy, and Humanistic psychology. Wilber refers to the integrated mind/body level of development as the centauric stage.

When one develops the urge to merge with a reality greater than one's individual self, the transpersonal therapies are there to help you. Examples here would include Jung's Analytical Psychology, Assagioli's Psychosynthesis and Past-life therapy. Generally, as one moves down the spectrum we find that therapies recognize and deal with the dualities at levels above them, whereas they don't recognize or deal with dualities below them on the spectrum, or,

insofar as they notice them at all they do so reductionistically. (Remember that "upper" and "lower" refer to the spectrum as delineated in Figure 1.) Reichian bioenergetics therapy, for example, will deal with problems related with Persona or Egoic dysfunction, but will not provide help in synthesizing a greater integration with the Existential or environmental "other," or unity with the Absolute. The transpersonal therapies are not primarily concerned with achieving transpersonal states, but do include work at that level without attempting to reduce them into upper level theoretical structures. The Transpersonal bands include a whole gamut of experiences that extend consciousness beyond the egoic sphere, such as peak experiences, psychic phenomena, interaction with the collective unconscious, out-of-body experiences, working with spirit guides, etc.

Finally we arrive at those disciplines that enable one to overcome all dualities to achieve unity with the Divine. Here we completely leave behind the domain of psychotherapy and take up the spiritual work of the esoteric traditions. Vedanta, Mahayana Buddhism, Daoism, Sufism, Mystical Christianity and Esoteric Judaism represent the schools of thought that are appropriate here.

The overall parallel of Wilber's spectrum of consciousness of Plotinus's schema of the One and Its processions to Intellect and Soul and return back to the One is quite obvious. In subsequent writings, however, Wilber amends this circular model wherein the soul simply returns to its divine origins (the U-turn model) and argues that evolution progresses indefinitely, such that the soul is not merely making up for lost ground in the return journey but is involved in the divine project of ever greater integrations. The goal is not to leave this body and earth to return to heaven, but to bring more of heaven down to earth. More ascent is a half-baked spirituality. Ascent is followed by descent; the greater one's ascent, the greater one's compassion and capacity for integrating the lower. Here we find the influence of Plato, Jean Gebser and Sri Aurobindo prominent in Wilber's reformulation of the significance of spiritual development. This distinction better enables Wilber to criticize those theories that declare, for example, that egoic rationality is a mistake and that salvation lies in regressing to pre-egoic, mythic or magical states of consciousness integration. He strongly emphasizes the importance of developing reason to its full capacity. The great seers of nonduality, such as Buddha, Nagarjuna, Shankara, Eckhart,

Wang-Yang Ming and Ramana Maharishi, did not disparage reason, but used reason to the fullest to go beyond reason.

It is not possible in this modest essay to touch on all but a few of the major bases of Wilber's thought developed through a dozen books, but I would like to close with some ideas taken from his latest book, *Sex, Ecology, Spirituality*.

In the tradition of Leibniz and Whitehead, Wilber states that, "All developmental and evolutionary sequences that we are aware of proceed by hierarchization, or by orders of increasing holism—molecules to cells to organs to organ systems to organisms to societies of organisms, for example."<sup>4</sup> Another way of saying it is that the world is arranged holarchically. "Reality is not composed of things or processes; it is not composed of atoms or quarks; it is not composed of wholes, nor does it have any parts. Rather it is composed of whole/parts, or holons.... There is nothing that isn't a holon (upwardly and downwardly forever)."<sup>5</sup> "Every holon is simultaneously both a subholon (a part of some other holon) and a superholon (itself containing holons). Holons, moreover, both as individual and as social holons, have both an exterior and an interior (i.e., some form of consciousness). These are a few of the score of tenets Wilber describes of holons leading up to the major thesis that all holons have four quadrants.

The four quadrants are depicted in Figure 2. The right hand side graphs the exterior sides of holons and the left hand side denote the interior. The upper half charts individual holons while the lower half charts social or communal holons. Thus, if we start with the upper right quadrant, there we can chart the evolutionary progress of the exterior forms and structures of individual holons. In each quadrant we begin at the center and move out. Holons and evolution have directionality towards increasing complexity, telos, autonomy, etc. So the center here would be the Big Bang and we move from there up the ladder of evolutionary forms to subatomic particles to atoms to molecules to cells to neural organisms to triune-brained organisms. When referenced to humans this quadrant emphasizes behaviorism, which will have nothing to do with introspection. The data of introspection would be found in the upper left quadrant. From the center we follow the evolutionary trail from prehension to sensation, impulse, image, symbol, concept and so on. Every point on the left side has a correlate on the right

side (concepts, for example, with the neocortex of complex triune brains); every exterior has an interior.

**Fig. 2: The Four Quadrants**

(Formop=formal operational thought; Conop=concrete operational thought)

Every point on the upper half has also a corresponding point on the lower half. So all four quadrants have corresponding points with each other. The lower right quadrant runs from the Big Bang to superclusters to galaxies to stars to planets to (on Earth) the Gaia or bio-system to ecosystems to societies with division of labor to families. With reference to humans, this quadrant then runs from kinship tribes to villages to nation-states to global world-system. Of course everything on the right hand side is studied through the empirical sciences. Sociology, for example, mostly confines itself to studying the exterior, measurable, behavioral aspects of social systems, to the unfortunate neglect of the lower left quadrant of the interior, cultural aspect of shared values and common world views. With regard to humans, the lower left quadrant charts the evolution of world views or structures of consciousness from the archaic to the magical to the mythic to mental and emerging possible postmodern developments.

From a Neoplatonic viewpoint, the Four Quadrants schematizes the evolutionary Return to Spirit in a grand way. Wilber uses this schema to illuminate various psychohistorical developments. For example, while most critics of modernity have focused on the atomism of upper right-handers, the fact remains that most Enlightenment thinkers were indeed holists, but holists of the lower right, which is to say, they were "flatland" holists who reduced the left hand quadrants to the right. Thus the burgeoning crop of eco-holists and systems theorists today are not really an improvement over the modernists. They, too, reduce the Kosmos of the four quadrants to just the right hand. Merely indoctrinating people with flatland eco-holism will not bring about the reorientation towards nature necessary to avert ecological destruction. There has to be a corresponding transformation of the interior, consciousness dimension if we are to correctly attune ourselves to the evolving reality.<sup>6</sup>

As a last thought, the Four Quadrants can be reduced to three when we combine the two right hand quadrants into one, since they both are exteriors that can be described in it-language (the upper left uses I-language and the lower left, we-language). Wilber refers to these as the Big Three (it, I, we). We find the Big Three in many philosophies. For example, Plato's the True (or propositional truth referring to an objective state of affairs, it), the Good (or cultural justice and appropriateness, we), and the Beautiful (or the individual-aesthetic dimension, I). Again, the Big Three are covered by each of Kant's three Critiques.<sup>7</sup> Kant's work climaxed

modernity's effort to differentiate the Big Three (a feat most Romantics have wanted to reverse). The task of postmodernity, writes Wilber, is to integrate the Big Three. Kant and many post-Kantians hoped to find the key to integrating them in the aesthetic dimension. While it is true that the aesthetic domain does connect the empirical phenomenon of sensorimotor cognition ("science") and practical ethics ("morality"), this connecting link does not integrate these domains. Wilber makes his point by way of a metaphor: "It's like saying that the fourth grade lies between the third grade and the fifth grade and connects them, which it does; but the *integration* of the knowledge in those three grades is to be found in the sixth grade, not in the fourth."<sup>1</sup> Hence, the integration of the Big Three is not to be found in some intermediate domain but dialectically at a yet-higher level which he calls vision-logic. Here he sounds a note similar to such other contemporary Neoplatonically-oriented writers as Gebser and Sri Aurobindo.

Towson University

#### NOTES

1. A good introduction to transpersonal psychology is the book *Paths Beyond Ego* by Roger Walsh and Frances Vaughan, eds. (Los Angeles: Tarcher, 1993).
2. Books by Ken Wilber include the following: *The Spectrum of Consciousness* (Wheaton, Ill: Quest, 1977); *No Boundary* (Boulder: Shambhala, 1981) is a shorter, more popular version, ideal for undergraduate students; *The Atman Project: A transpersonal view of human development* (Wheaton: Quest, 1980); *Up From Eden: A transpersonal view of human evolution* (NY: Doubleday, 1981); *A Sociable God* (NY: McGraw Hill, 1982); *Eye to Eye: The quest for the new paradigm* (NY: Anchor, 1983); and with J. Enger and D. Brown, *Transformations of Consciousness: Conventional and contemplative perspectives on development* (Boston: Shambhala, 1986).
3. *The Spectrum of Consciousness*, p. 119.
4. *Sex, Ecology, Spirituality* (Boston: Shambhala, 1995), p. 19.
5. *Ibid.*, p. 33.
6. For a Neoplatonic approach to environmental ethics strikingly similar to that advocated by Wilber, see my *Revisioning Environmental Ethics* (New York: SUNY-Press, 1990). I argue that *theoria* or contemplation is the indispensable basis for effective ecopraxis.
7. *Sex, Ecology, Spirituality*, p. 144.
8. *Ibid.*, p. 392.

## Platonopolis Revisited

Robert Meredith Helm

Plotinus (c. 204-270) may be given credit for establishing Platonic philosophy as an ineradicable influence in Roman intellectual life and, indeed, in the Western world at large. He was born in Egypt and, although his ancestry is uncertain, he had a Latin name. After attending elementary school in his home town, he went to Alexandria for further study. There he went from philosopher to philosopher until his twenty-ninth year, searching for a key to the truth about the universe. At last, on the advice of a friend, he sought instruction from Ammonius Saccas, called "The Porter," who had once been a Christian but who had returned to the Greek religion. Ammonius's teaching was of such high quality that Plotinus stayed with him for eleven years.

Interested in learning something about Oriental philosophy, Plotinus went with the army of the Emperor Gordian III in a campaign against King Sapor of Persia, hoping to be able to have consultation with the Persian Magi and perhaps even the Indian sages. Gordian was murdered in Mesopotamia, and Plotinus, on his way home, got back as far as Antioch. Instead of returning to his native Egypt, however, he went to Rome in 244. There he established a school and spent the rest of his life as a teacher. He was a favorite of the Emperor Gallienus and his wife.

Like his master, Ammonius Saccas, who never committed his thoughts to writing, Plotinus confined himself to oral teaching until he was fifty years of age. Then he began writing down his thoughts in the work we know as the *Enneads*, so called because of the arrangement of its chapters in groups of nine. After his death, Porphyry, one of his pupils and himself a celebrated Neoplatonist, wrote his master's biography and used it as an introduction to the *Enneads*, which he edited and published.

For Plotinus, the Platonic philosophy was not simply a way to know about the universe through rational speculation. It was a way of life by which he sought to ascend through the stages of reality to the source of his own being through intellectual and moral self-discipline.

It thus had for him a distinctly religious quality, and it was seen by his followers as an alternative to Christianity and the other cults which commanded the allegiance of people of the Empire. It thus represented the last stand of enlightened Hellenic Paganism against the onslaught of Eastern religious thought.

A tantalizing paragraph of Porphyry's biography gives us an all too brief glimpse of Plotinus as a would-be statesman.

The Emperor Gallienus and his wife Salonina greatly honoured and venerated Plotinus, who thought to turn their friendly feeling to some good purpose. In Campania there had once stood, according to tradition, a City of Philosophers, a ruin now; Plotinus asked the Emperor to rebuild this city and to make over the surrounding district to the new-founded state; the population was to live under Plato's laws: the city was to be called Platonopolis; and Plotinus undertook to settle down there with his associates. He would have had his way without more ado but that opposition at court, prompted by jealousy, spite, or some such paltry motive, put an end to the plan. (Porphyry 12. MacKenna 9)

Had Platonopolis actually been founded, what sort of city would it have been and what impact would it have had upon the history of statecraft? Plotinus himself never formulated a systematic political theory, but he clearly regarded the Platonic state as an appropriate vehicle for the achievement of certain ends that had some importance in his philosophy.

But which Platonic state? The one laid out in the *Republic*, the one ruled by a single philosopher-king proposed in the *Politicus*, or the pragmatically designed one described in the *Laws*?

Everything we know about Plotinus' nature from his writings would seem to indicate that he had the *Republic* in mind as his model, but if he had been permitted to carry out his plan, he undoubtedly, like Plato in his later years, would have found it necessary to face some hard questions as to the ways in which the values of an ideal state can in some measure be realized in an actual human community.

Basically, there are two ways in which governments can make a plausible claim to legitimacy.

The first may be described as ethnic or tribal. On the basis of blood kinship, reinforced by a common language and shared folkways, a society gradually takes shape as a sort of organic growth. Its common ideas are rooted in a familial tradition, and any codification of them is in the nature of a ratification of existing custom rather than of a

formal contract on which the society is based. If radical innovation occurs, it is as the result of the arbitrary decision of an authority with sufficient power to enforce its decrees, even if they challenge tradition. Legitimacy is endangered when the challenge is perceived as too radical for the populace to accept.

The second may be characterized as ideational or ideological. On the basis of a conceptual scheme dealing with human nature and the purposes for which organized societies exist, a collection of people convinced of the correctness of that scheme contract with one another to form a community based on their principles. Government achieves legitimacy by gaining the consent of the populace to be ruled by those principles. Legitimacy is threatened when government violates the principles or when they cease to be recognized as normative by the governed.

Plato's *Republic* was the quintessential expression in antiquity of the second path, and although his attempt to put theory into practice in Syracuse and Plotinus's later proposal to found the Republic in Italy were frustrated, it has been influential in almost every society in the West since his time.

Of course, the society that Plato envisioned in each of his political writings was a *polis*, a city state in the Greek mould, which would in some measure have the additional claim to legitimacy of an ethnic society in that it would possess from the outset many of the common feelings and shared folkways of a relatively homogeneous citizenry. Plotinus too would apparently have been content with a single city and a little land surrounding it. We have no evidence that he thought in terms of polyglot populations with diverse cultural backgrounds, scattered over very large areas. A Roman Empire governed by philosophy was not his goal. That vision was left for Stoics and followers of Cicero. In the Italy of his day, Platonopolis might or might not have had a homogeneous population, but in either case, its principal claim to legitimacy would have resided in the ideas on which it was based.

For Plotinus, as for Plato, the proper function of a state is determined by an understanding of what constitutes virtue. The ground of reality provides the ultimate sanction for an ethical system, and the One, who may also be called Beauty or the Good, is the source of all value. Virtue, however, does not exist as such in the transcendent realm from which the world of space and time are generated. It is a property of the Soul world. In that lower realm, civic virtues have a role of some importance in creating and supporting a society in which members

of a community may as individuals be free to develop those higher faculties that can lead them toward ■ greater likeness to God.

The material house is not identical with the house conceived in the intellect, and yet stands in its likeness: the material house has distribution and order while the pure idea is not constituted by any such elements; distribution, order, symmetry are not parts of an idea.

So with us: it is from the Supreme that we derive order and distribution and harmony, which are virtues in this sphere: the Existences there, having no need of harmony, order, or distribution, have nothing to do with virtue; and none the less, it is by our possession of virtue that we become like to Them.

Thus much to show that the principle that we attain Likeness by virtue in no way involves the existence of virtue in the Supreme. (*Enneads* I. 2. 1. MacKenna 31)

Likeness to God is attained by "becoming just and holy," "living by wisdom" (*Enneads* I. 2. 1. MacKenna 30). It is sought out of the desire to escape from evil, which has no place "among Beings or in the Beyond Being," where there is only good. What we think of as the evils of the world are situate in a faint image of Being not far above Non-Being, which is not "something that simply does not exist, but only something of an utterly different order from Authentic-Being" (*Enneads* I. 8. 3. MacKenna 67-68).

Now this (the required faint image of Being) might be the sensible universe with all the impressions it engenders, or it might be something of even later derivation, accidental to the realm of sense, or again, it might be the source of the sense-world or something entering into it to complete its character. (*Enneads* I. 8. 3. MacKenna 68)

Absolute evil is "below all the patterns, forms, shapes, measurements, and limits" (*Enneads* I. 8. 3. MacKenna 68). In human experience, however, evil is found in varying degrees and kinds because the soul, in association with matter,

...accepts evil—unmeasure, excess, and shortcoming, which bring forth licentiousness, cowardice, and all other flaws of the Soul, all the states, foreign to the true nature, which set up false judgements, so that the Soul comes to name things good or evil not by their true value but by the mere test of like or dislike. (*Enneads* I. 8. 4. MacKenna 69)

It is the function of a legitimate state to provide conditions under which individual souls are given every possible opportunity to escape that hedonic bondage to matter. In human life, however, the situation is complicated by the fact that not every lack is evil. There is an intermediate classification of "Not-Goodness" (*Enneads* I. 8. 5. MacKenna 70). Shortcomings in this category, however, are dangerous in that they may provide an occasion for the ultimate fall of the soul, and so a sufficiently serious shortcoming may in this sense be "an evil" (*Enneads* I. 8. 5. MacKenna 70).

Another aspect of Plotinus's view of the relation of evil to human institutions may be found in his concern with matters "external to the soul," such as sickness and poverty. How, he asked, may they be related to his privative theory of evil? He answered:

Well, sickness is excess or defect in the body, which as a material organism rebels against order and measure; ugliness is but matter not mastered by Ideal-Form; poverty consists in our need and lack of goods made necessary to us by our association with Matter whose very nature is to be one long want. (*Enneads* I. 8. 5. MacKenna 70)

All these may be "evils." Are they subject to amelioration by individual or collective action, or are they ineradicable features of the human condition? Plotinus, while maintaining that *any* association with the Non-Being of matter introduces a lack and that any considerable lack may conduce to evil, gave a firm, if qualified, endorsement of moral effort. The Platonic injunction to "flee hence," he said, does not refer to an immediate flight to the heavenly realm. "The flight we read of consists not in quitting earth but in living our earth-life with justice and piety in the light of philosophy" (*Enneads* I. 8. 5. MacKenna 70).

The stage is thus set for a place in the Platonic state for all those operations that might be concerned with bodily well being, the production of useful goods, and even the cultivation of the arts, for which Plotinus showed greater appreciation than Plato, holding, as he did, that works of art, rather than being mere reproductions of natural objects which are themselves imitations, "go back to the Reason-Principles from which Nature derives, and...are holders of beauty and add where nature is lacking" (*Enneads* IV. 8. 1. MacKenna 422-423).

For Plotinus, as for Plato, the state exists to establish and maintain justice. The Republic is a macrocosm modeled after the microcosm of the individual. Plato saw every human soul as having an appetitive,

■ spirited, and a rational part, although in view of the unity of the soul, the word "faculty" is probably preferable to "part" as ■ rendering of *metos* in this context. The lowest is the appetitive faculty, the seat of physical craving. Somewhat higher is the spirited faculty, the seat of daring and enterprise. Higher still is the rational faculty, which ideally governs the other two and keeps them in harmony, as the charioteer in the *Phaedrus* controls two horses of unequal nobility and keeps them on a steady course. When a proper balance of the faculties is achieved by the subordination of the two lower aspects of the soul to the higher, each *metos* achieves the virtue proper to it.

Temperance is the virtue of the appetitive faculty when it is under the rule of reason. Fortitude, or courage, is the virtue of the spirited part when it initiates rationally controlled actions. The rational faculty is, of course, autonomous, and its proper self-governance results in wisdom. When the faculties work together in harmony, a fourth virtue, justice, is produced. This is the good for the individual human being.

Plotinus in one context described the soul in terms of reproductive, intellective and intuitive "phases" (*Enneads* V. 3. 9. MacKenna 390-391), but in discussing the civic virtues, he accepted the language of Plato. Though for him they may be predicated only of souls enmeshed in the world of sense and not of pure souls unencumbered by matter, the Platonic civic virtues have real significance for the establishment of a human society (*Enneads* I. 2. 1. MacKenna 30). Although he did not supplement his own account of the civic virtues of individuals with a detailed treatment of the state as "man writ large," it is evident that for Plotinus, as for Plato, the state must have corporate functions similar to those of the individuals composing it and that a society would be supplied, defended, and governed justly when it is ruled by the rational faculty. Justice does not prescribe similar treatment for all the citizens of a state. Neither for Plato nor for Plotinus, to be sure, is there any suggestion of the desirability of an aristocracy of birth, although Plato had an apparent interest in eugenics, which has been echoed in our own time in the works of Dean Inge. In Platonic political theory though, proper education of the right people can cultivate an aristocracy of the soul, the relative presence or absence of which can dictate the place a person ought to occupy in society.

There are, Plotinus said:

...two distinct forms, the way of the Sage and the way of the mass, the Sage intent upon the sublimest, upon the realm above, while those of

the more strictly human type fall, again, under two classes, the one reminiscent of virtue and therefore not without touch with good, the other mere populace, serving to provide necessities to the better sort. (*Enneads*, II. 9. 9. MacKenna 140)

Plato regarded his rulers as the cream of a broader class which also included not only the finally selected Guardians, but also those defenders of the state who came to be known as Auxiliaries. Plotinus, though recognizing that the auxiliaries are "not without touch with good," appears to have thought that they do not differ from the masses as much as they do from the sages. The function of both of the lower classes seems to be to support "the better sort."

On the face of it, this seems to suggest a coldly aristocratic view of society, redeemed only in part by the fact that Plotinus saw the material demands of "the better sort" as minimal. For them:

It (the soul) will hold itself above all passions and affections. Necessary pleasures and all the activity of the senses it will employ only for medicament and assuagement lest its work be impeded. Pain it may combat, but failing the cure, it will bear meekly and ease it by refusing to assent to it. All passionate action it will check: the suppression will be complete if that be possible, but at worst the Soul will never itself take fire but will keep the involuntary and uncontrolled outside its own precincts, and rare and weak at that. The soul has nothing to dread, though no doubt the involuntary has some power here too: fear therefore must cease except so far as it is purely monitory. What desire there may be can never be for the vile: even the food and drink necessary for restoration will be outside the Soul's attention and not less the sexual appetite: or if such desire there must be, it will turn upon the actual needs of nature and be entirely under control; or if any uncontrolled motion takes place, it will reach no further than the imagination, be no more than a fleeting fancy. (*Enneads* I. 2. 5. MacKenna 34)

In providing an environment in which such a lofty mode of life can be followed by "the better sort," there is no barrier to the achievement of lesser goals by those who serve that purpose. An abstemious and non-acquisitive intellectual aristocracy is not incompatible with a lively world of commerce at the lower levels. Arguably, the activities conducted at those levels might be essential for the health of a society that could afford philosophers. The Platonic society makes no pretense of being democratic, but it does seek to produce sources of satisfaction appropriate to each level of the populace.

What relevance does Platonopolis, an unfulfilled dream of a third-century Neoplatonist, have for the problems the world faces at the close of a century in which the ideologies that inspired such confidence in a more optimistic age are succumbing to a growing tribalism based on seemingly irreconcilable ethnic differences? Can any system of ideas serve as a pattern for the governance of great states with heterogeneous populations in such a way that political legitimacy rests on the shared ideas rather than on genetic, linguistic, cultural, or religious identity?

Plotinus offered us no blueprints for a state, and if he had, there would have been many features in them that we would reject. There are, however, some fundamental principles in his philosophy that may be essential to any attempt to establish and maintain the sort of societies demanded for our own time.

First, there is the primacy of the individual. Although the structure of Plato's *Republic* has all too often served as a model for unsavory governments guided by principles quite different from his own, it must not be forgotten that his political theory was based on his analysis of the faculties and needs of single human beings. The state was "man writ large." The society he proposed is, to be sure, one that is so highly structured that it constitutes a sort of complex organism in itself, but its corporate hungers and aspirations are the hungers and aspirations of private citizens working together for the common good. For Plotinus too, the state exists so that individuals may live in an environment that will enable them to seek the highest degree of fulfillment to which they may reasonably aspire. Inequalities in the society are the result of differing potentialities rather than of the arbitrary exercise of power by an external authority. For those whose desires are directed toward pleasure or gain, sources of amusement and material wealth exist in the good *polis*, but it reserves the most honored place for those who follow a way of life that leads them beyond worldly values.

Withdraw into yourself and look. And if you do not find yourself beautiful yet, act as does the creator of a statue that is to be made beautiful: he cuts away here, he smooths there, he makes this line lighter, this other purer, until a lovely face has grown upon his work. So do you also: cut away all that is excessive, straighten all that is crooked, bring light to all that is overcast, labour to make all one glow of beauty until there shall shine out on you from it the godlike splendour of virtue, until you shall see the perfect goodness established in the stainless shrine. (*Enneads* I. 6. 9. MacKenna 63)

Plotinus has often been criticized for being too much concerned with the personal and private aspects of character building and too little with concern for the welfare of one's fellows. It is true that his conception of *eudaimonia* is essentially individual rather than collective and that loving one's neighbor as oneself does not play a central role in his political philosophy. "The proficient," he said, "would like to see all men prosperous and no evil befalling anyone; but though it prove otherwise, he is still content" (*Enneads* I. 4. 11. MacKenna 49). This independence of the individual soul, however, in seeking the higher good, is by no means inconsistent with at least a passive preference for the well-being of other individuals. In fact, Plotinus said, "The more perfect the man, the more compliant he is, even towards his fellows; we must temper our importance, not thrusting insolently beyond what our nature warrants; we must allow other beings, also, their place in the presence of the Godhead" (*Enneads* II. 9. 9. MacKenna 141).

Second, a legitimate state cannot exist merely as an instrument of power or privilege. It must be an agency for the achievement and maintenance of justice. As defined by both Plato and Plotinus, the idea of justice embraces every function of society from the production of material goods to philosophy, and there is the further implication that in a just society—one ruled by reason—each citizen must be treated fairly. Fairness does not mean that all of them are treated identically, without regard for their circumstances, their abilities, or their particular needs. It does require that all be afforded the opportunity to become what they can become in the light of the dictates of reason. Education is therefore of paramount importance in the Platonic society as an instrument for offering every individual the maximum opportunity to escape the bondage of an imprisoning environment.

Plotinus's position on the equality of souls is not without ambiguity. A certain sort of equality is suggested by the fact that pure souls, untrammelled by matter, are ideally and equally free of evil. Even this notion may, however, have a caveat. "Souls," he said, "vary in worth; and the difference is due, among other causes, to an almost initial inequality; it is in reason that, standing to the Reason-Principle as parts, they should be unequal by the fact of becoming separate" (*Enneads* III. 2. 18. MacKenna 77). In becoming embodied, souls naturally gravitate to the sort of condition appropriate to them. Legitimate differences are, thus, ideally grounded and are not a merely a product of arbitrary social determination.

Third, a good state embodies freedom. Freedom is an aspect of the essential nature of the soul, which, when it is not joined with body, "is not, itself, ■ thing sprung like things from life-seeds, but a first-hand Cause, bodiless and therefore supreme over itself, free, beyond the reach of cosmic Cause" (*Enneads* III. 1. 8. MacKenna 159). Plotinus rejected materialism categorically, and he also denied that a human being is essentially "the couplement of Soul and Body" (*Enneads* I. 4. 14. MacKenna 50). We do *have* bodies though, along with the surroundings in which they function. As human beings in society, we are partly controlled by our environment and partly sovereign. The nobler the soul, the greater is the degree of freedom it enjoys (*Enneads* III. 1. 8. MacKenna 159).

In Plotinus's thought, then, the idea of freedom goes well beyond the privilege of doing what one wishes. In fact, since one's wishes are more often than not shaped by one's environment, that sort of pseudo-liberty can, in Neoplatonic terms, be the most abject form of slavery. A populace conditioned to exercise its liberty by uncritically accepting the values of politicians, pundits, and mass media is no fit candidate to qualify as the citizenry of a rational state. True freedom is an autonomous activity of the human soul that wills not to accept the tyranny imposed upon it by the bombardment of the senses and is ever seeking higher ground. In Platonopolis, freedom entails not only liberty but moral responsibility.

Fourth, it may be urged that if any of the ideals of such a state are to be realized in our time, the cement that binds the members of a society together must transcend ethnic and cultural differences. Its shared values must be defined in terms of human characteristics that have universal value. It was *ideas* that brought the Republic and Platonopolis to life in the minds of their creators. This is not to say that the richness of ethnic values cannot be fully appreciated and enjoyed in the cultural life of the larger society. They should, in fact, be treasured far beyond the bounds of the communities that gave birth to them. But they must not be sources of hatred, division, and civil strife. People of different races, religions, and languages can live side by side in peace and friendship when they are united by a view of the world that sees diversities as reconcilable in the higher unity of a common humanity.

Finally, the principles that make such a unity possible must, as Plotinus himself insisted, be recognized as having their origin in a transempirical realm. The world of sense is not without importance,

and Plotinus was uncompromisingly hostile to the Gnostics, who could see no good in it, not recognizing that "the world, to those who have known it once, must be the starting-point of the pursuit" (*Enneads* II. 9. 15. MacKenna 147). It cannot, though, be the source of value, nor, he held in his criticism of materialism, could the soul itself be a product of the fortuitous concurrence of atoms. No combination of bodily matter can produce a unitary soul capable of "self-sensitiveness" (*Enneads* IV. 7. 3. MacKenna 343). Matter is not self-molding and cannot impart life to itself, and so, "life must be brought upon the stage by some directing principle, external and transcendent to all that is corporeal" (*Enneads* IV. 7. 3. MacKenna 343).

The same is true of value. The world of sense has many things in it that remind us of truth, goodness, and beauty, but it cannot be the source of those values. No amount of expertise in analyzing what *is* can be a sufficient qualification for determining what *ought* to be, and no mere combination of colors, shapes, or sounds can account for the beauty we experience in material objects.

Since the First World War, the greater part of the present century has been dominated by interaction among political and economic ideologies: Marxism, Fascism, National Socialism, Western democracy, and the like. Adherence to the two most durable of these, Marxism and Western democracy, made it possible for peoples with widely varying cultures to be brought together under systems represented as universal enough to combine those cultures into super states with a shared ethos that was supposed to transcend ethnic differences.

The experience has been instructive, but not altogether encouraging. In some instances, the ideologies, whatever their positive accomplishments, not only have been insufficiently inclusive to avoid conflict with one another, but have failed to provide a cement of sufficient strength to hold together diverse peoples with strong emotional commitment to their own traditions and aspirations and equally strong hatred for the traditions and aspirations of others. The result has been a proliferation of smaller states, asserting a precarious legitimacy on ethnic grounds and living in uneasy tension or open warfare with their neighbors.

Even the ideationally based states that have survived more or less intact have not altogether managed to banish the specter of ethnic dissolution. The idea of the common good as defined in terms of a shared humanity has been diluted by the special claims of particular groups, asserted on the basis of a shared racial, cultural, or religious identity putting them at odds with other factions pressing rival claims

and all of them at odds with the structure of the broader societies of which they are a part.

In a world that seems to be poised on the brink of an anarchic dark age, and in which the current rush toward ethnocentrism cannot possibly provide a sufficiently broad foundation for a world society in which a recognition of the interdependence of nations can be effectively recognized, we are faced with a question on which our very survival may depend. Can we arrive at any common agreement on principles on which the relations of members of each society toward their fellows and the relations of those societies to one another in a peaceful world community can be based?

Whatever criticisms may be leveled legitimately against many features of the Platonic Republic, Plotinus, more clearly than most thinkers, saw that no coherent moral or political philosophy is possible without empirical and ideal elements. Principles are grounded in the ideal and their particular applications in the empirical. It is the business of rational individuals and rational governments to bring the two together in harmony for personal and social good. In revisiting Platonopolis, we can refresh ourselves from one of the springs from which that conviction flows.

## Deconstructionism and Neoplatonism: Jacques Derrida and Dionysius the Areopagite

Leo Sweeney, S.J.

In beginning to present this paper I find a remark of Derrida may prove helpful. At the start of his book, *Dissemination*, he places what he calls "Hors Livre: Outwork; Hors d'Oeuvre, Extratext, Foreplay, Bookend, Facing, Prefacing." My paper also begins with a "Preface."

### Preface

Two or three years ago I had heard the word "deconstruction" in connection mainly with literature and philosophy, and I took it to mean one deconstructs a text by reading into it whatever would please me and ignoring the meaning which its author had in mind.<sup>1</sup> But last fall R. Baine Harris invited me by telephone<sup>2</sup> to present something during a plenary session at Vanderbilt University on May 27, 1995, a day dedicated to "Neoplatonism and Contemporary Fine Arts." Imprudently, I agreed and gave him as a title: "Deconstruction, Poetry, Neoplatonism: Jacques Derrida and John of the Cross"—"poetry" in the title would be what Jacques and John might share because the former had commented upon some poetry<sup>3</sup> and John's writings are poetry.

But when I began to read Derrida, I discovered he seems seldom if ever to mention John of the Cross and attends rather often to Meister Eckhart and to Dionysius the Pseudo-Areopagite.<sup>4</sup> Since I am somewhat acquainted with the last, I decided to reflect on his negative theology and on Derrida's remarks on the same topic in his essay, "How to Avoid Speaking: Denials," where he often quotes and interprets Dionysius.<sup>5</sup>

A second comment in this "Preface" may be helpful—namely, my attention was directed also to deconstructionism when writing

chapter 26 in my book *Christian Philosophy: Greek, Medieval, Contemporary Reflections*, (New York/Bern: Peter Lang Publishing, Inc. 1997). That chapter asks, "Can Thomas Aquinas Help Our Modern World?" and it developed by my setting up a section, "The Modern Mind: 1920–1960," where the "roots and primal forces" of the ideas dominating our minds, according to Jacques Maritain, are Luther in religion, Descartes in philosophy and Rousseau in morality.<sup>7</sup> "The Modern Mind: 1960–1980" is a second section, where the ideas dominating our minds, according to columnist George F. Will, are Darwin, Freud and Einstein.<sup>8</sup> A final section is entitled "Deconstructionism: 1980 to Now," where obviously Derrida would fit. But here something strange occurred. It turns out that on that occasion my awareness of deconstructionism and, more generally, postmodernism was under the guidance of two authors who are unsympathetic to that postmodern movement and to Derrida.

This guidance occurred because the three sections just named had been preceded by a section, "Past, Present and Future," which served as an introduction to my chapter 26 on Aquinas and our contemporary world by sampling books and articles which contrast or compare past decades with current and future ones and which take varied approaches. For example, some authors restrict themselves to specific topics, such as poverty<sup>9</sup> or the Cold War<sup>10</sup> or religion<sup>11</sup> or abortion.<sup>12</sup> Others trace the history of a specific people—for instance, Nathan Rotenstreich's books on Jews<sup>13</sup> and Yeshayahu Leibowitz's *Judaism, Human Values and the Jewish State*.<sup>14</sup> Although Morris Dickstein restricts himself to literary criticism,<sup>15</sup> others attend to modern art as well,<sup>16</sup> or to the academic life even more generally. For example, in his long essay, "The Fraying of America," *Time*, February 3, 1992, pp. 44–49, Robert Hughes speaks of political correctness and multiculturalism and of their effects on campus life and studies.<sup>17</sup>

This list terminated with Gertrude Himmelfarb's book, which is decidedly unsympathetic to deconstructionism and which is entitled *On Looking into the Abyss: Untimely Thoughts on Culture and Society*.<sup>18</sup> She discloses that the very title of her book comes from the deconstructionists, who use "the image of the abyss" with reference to language—"a purely linguistic [abyss] constructed and deconstructed." But, she adds, "philosophy also has its abysses, and some philosophers are confronting them in the same way—playfully and irreverently, as a linguistic construct, having no 'correspondence' with anything posing as 'reality' or 'truth.'" "for, as Nietzsche says, 'Truths are illusions

of which one has forgotten that they are illusion."<sup>19</sup> Thus, as Himmelfarb summarizes her interpretation,

In literature, postmodernism amounts to a denial of the fixity of any 'text,' of the authority of the author over the interpreter, of any 'canon' that privileges great books over lesser ones. In philosophy, it is a denial of the fixity of language, of any correspondence between language and reality—indeed, of any 'essential' reality and thus of any proximate truth about reality. In law (in America, at any rate), it is a denial of the fixity of the Constitution, of the authority of the founders of the Constitution, and of the legitimacy of law itself, which is regarded as nothing more than an instrument of power. In history, it is a denial of the fixity of the past, of the reality of the past apart from what the historian chooses to make of it, and thus of any objective truth about the past.<sup>20</sup>

To make matters worse in my understanding or appreciating Derrida, I first learned of Himmelfarb's book from Michael Howard's review in the *New York Times Book Review*, where he states that Himmelfarb's book is a "coherent and devastating attack on the forces of postmodernism in academic studies, literary, philosophical, and historical." A postmodernist such as Jacques Derrida has emitted "a dense cloud of unintelligible verbiage... [He and other deconstructionists are at best] frivolous game-players who make a virtue of their moral irresponsibility. At worst, they are set on destroying the standards that not only make their own activity possible but also enable society to survive at all. Either way they are bad news."<sup>21</sup>

But there is more to come: still another author I read who is hostile to deconstructionism—namely, David Lehman in his *Signs of the Times: Deconstruction and the Fall of Paul de Man*.<sup>22</sup> There he centers on the deconstructionism introduced to America especially by Paul de Man (1919–1983), who was a teacher in the French and comparative literature departments first at Cornell and Johns Hopkins universities and, from 1970 on, at Yale. By "adapting Derrida to the field of literary studies, de Man obtained for deconstruction what it never fully or only fleetingly enjoyed in France: an institutional base of operations and a home in the academic disciplines devoted to English and comparative literatures" (Lehman, p. 145). His first book, *Blindness and Insight* (1971), "quickly achieved the status of a classic." In its opening essay de Man "announced... that 'the rules that governed the discipline of criticism and made it a cornerstone of the intellectual establishment

have been so badly tampered with that the entire edifice threatens to collapse.” His solution to the crisis? He proposed

a radical relativism...; there are no longer any standpoints that can a priori be considered privileged, no structure that functions validly as a model for other structures, no postulate of ontological hierarchy that can serve as an organizing principle in the manner in which a deity can be said to engender man and the world.

This, in short, was the deconstructive credo (Lehman, p. 153), which allowed de Man to “stare unflinchingly into the abyss” of modern literature and thought and to come away smiling, even though (or, rather, precisely because)

there were no truths. They had all become texts, duplicitous texts, fictions within fictions within fictions. If you examined a text closely enough, you inevitably arrived at a point where it deconstructs itself. Suddenly the ground beneath you has given way, and you must brace yourself for a fall from a vertiginous cliff (Lehman, p. 155).

As a result of his teaching, writing and public lectures de Man was to his academic confreres and to students “an exemplary figure, an inspiration and a model worth emulating. His was the fortunate immigrant’s tale: a survivor of Hitler’s Europe—a refugee or a resistance fighter; the details weren’t clear—who came to America and rose from penurious obscurity to a position of high intellectual eminence” (Lehman, p. 143). By the time of his death from cancer in December 1983, no one on the then contemporary intellectual scene surpassed him. “This adulation—and the widening ripples of de Man’s intellectual influence—continued for four years after his death. Then came the catastrophic revelations. Long ago and far away, the revered professor had done the unmentionable—something that, at any rate, he himself neglected to mention afterward” (Lehman, p. 158). On December 1, 1987, the *New York Times* revealed that in his native Belgium during World War II, de Man had from November 1940 to November 1942 written ninety-two articles for a newspaper (*Le Soir*) edited by a pro-Nazi staff.<sup>23</sup>

This revelation raised three heatedly debated questions. “Was de Man a fascist by ideological conviction, or was it sheer careerist opportunism that prompted the budding young literary critic to grab the chance to write for *Le Soir*, a national newspaper—albeit one committed

to a Nazi party line?” (Lehman, p. 159). Next, “how were people to understand his failure to acknowledge his wartime writings?” and third, “to what extent should a writer’s actions modify our understanding of his ideas?” That is, “did his wartime words, and his subsequent silence about them, confirm or contradict his analysis of language and writing, meaning and truth?” (Lehman, p. 160).

As a result of those three questions “the academic equivalent of a guerrilla war broke out in the pages” of newspapers and journals (Lehman, p. 161). This was a war Derrida himself entered in the Spring 1988 issue of *Critical Inquiry* with an article entitled “Like the Sound of the Sea Deep within a Shell: Paul de Man’s War.” This became a chapter in the 1989 volume *Responses on Paul de Man’s Wartime Journalism*.<sup>24</sup> Having been brought to America by Paul de Man in the 1970s for a series of visiting appointments at Yale University, Derrida in that chapter strove to deconstruct Paul de Man’s anti-Semitic writings of 1940–42 and thus exonerate him.<sup>25</sup>

The preceding pages of “Preface” have allowed me to disclose that my initial awareness of Derrida and, more generally, of deconstructionism has been nonsympathetic because colored by Gertrude Himmelfarb’s *On Looking into the Abyss: Untimely Thoughts on Culture and Society* and David Lehman’s *Signs of the Times: Deconstruction and the Fall of Paul de Man*. It is now time to make a different approach by studying Derrida himself on his own. This I shall do by sketching first what he means by deconstructionism and then how he applies that general theory to negative theology and related topics. My paper will terminate by looking at Neoplatonism and the negative theology one finds there.

## I. Jacques Derrida: Deconstructionist

Understanding Derrida authentically is now our goal, which however is not easy to achieve, and this might seem to occur at times because of Derrida himself. For example, consider his commentary on these verses of the poet Angelus Silesius.<sup>26</sup>

*Nichts werden ist GOTT werden.*

Nichts wird was zuvor ist: wirstu nicht vor zu nicht,  
So wirstu nimmermehr gebohrt vom ewgen Licht.

*To become Nothing is to become God.*

Nothing becomes what is before: if you do not become nothing,

Never will you be born of eternal light.

"How," Derrida asks, "is this *becoming* to be thought?"... This coming to being

starting from nothing and *as nothing*, *as God and as Nothing*, as the Nothing itself, this birth that carries itself without premise, this becoming-self as becoming-God—or Nothing—that is what appears impossible, more than impossible, the most impossible possible, more impossible than the impossible if the impossible is the simple negative modality of the possible.

In the next paragraph Derrida continues by defining deconstruction.

This thought seems strangely familiar to the experience of what is called deconstruction. Far from being a methodical technique, a possible or necessary procedure, unrolling the law of a program and applying rules, that is, unfolding possibilities, deconstruction has often been defined as the very experience of the (impossible) possibility of the impossible, of the most impossible.... The possibility of the impossible, of the "more impossible" that as such is also possible ('more impossible than the impossible'), marks an absolute interruption in the regime of the possible that nonetheless remains, if this can be said, in place.<sup>27</sup>

How are we to understand that definition (deconstruction is the experience of the impossible possibility of the most impossible), which on first hearing sounds contradictory? We must turn to what is the starting-point (as Rodolphe Gasché advises) of all modern philosophers from Descartes through the German idealists and Husserl and, apparently, to Derrida himself because of his acceptance (with them) of the Cartesian methodology. That is, one must turn away "from any straightforward consideration of objects and from the immediacy of such an experience toward a consideration of the very experience in which objects are given." Thus by "bending back upon the modalities of object perception, reflection shows itself to mean primarily self-reflection, self-relation, self-mirroring."<sup>28</sup> When one thus severs "the self from the immediacy of the object world," it is given "freedom as a thinking being."<sup>29</sup> And when one severs the self even *from the very experience itself* in which objects are given, it becomes even more free. It now has the freedom to ignore both objects and cognitive experiential states so as to concentrate upon language or, more accurately, upon texts and upon the speaking

and writing producing them or, still more accurately, upon endlessly thinking, speaking, writing otherwise than whatever precedes.

A few pages earlier Gasché has correctly pointed out that Derrida has no place for the "reflection" alluded to in my previous paragraph—not "because he would wish to refute or reject [it] in favor of a dream of immediacy" but because "his work questions reflection's unthought and thus the limits of its possibility." He is concerned with that "unthought" with that "beyond" of the "orchestrated mirror play of reflection that Derrida's [own] philosophy seeks to conceptualize." Thus he is concerned not with the mirror itself but with its "tain"—"the tinfoil, the silver lining, the lusterless back of the mirror. Derrida's philosophy, rather than being a philosophy of reflection, is engaged in the systematic exploration of that dull surface without which no reflection and no specular and speculative activity would be possible, but which at the same time has no place and no part in reflection's scintillating play."<sup>30</sup>

But what are the "unthought" and "beyond" which are symbolized by the mirror's tain? They consist in the infrastructures or undecidables which "command the mirror's play and determine the angles of reflection." Yet since this foil

is made of disseminated structural instances, the mirror's tinfoil necessarily becomes semitransparent and, as a correlate, only semireflective. Reflection, then, appears to be affected by the infrastructures that make it possible; it appears breached and breached as an inevitably imperfect and limited *Scheinen*. Total reflection is a limited play, not because of some defect owing to its finitude—as Hegel has shown, it is a *truly* infinite play—but because of the structurally limitless play of the undecidables that make it possible.<sup>31</sup>

Accordingly,

at first the mirror that Derrida's philosophy holds up seems to show us only its tain; yet this opaque tain is also transparent. Through it one can observe the play of reflection and speculation as it takes place in the mirror's mirroring itself. Seen from the inside this play gives an illusion of perfection, but observed through the tain, it appears limited by the infrastructural agencies written on its invisible side, without which it could not even begin to occur.<sup>32</sup>

Thus Derrida's criticism does not reject reflection and speculation (as found, for example, in traditional onto-theologies with their search for transcendental signifiers and transcendental signifieds)

in favor of total immediacy, nor does it presuppose an originary unity by virtue of which the traditional problems of reflexivity can be dialectically overcome in absolute reflection or speculation. Derrida's debate with reflection and speculation is not dependent on the essentially philosophical problem of the aporias, contradictions, or negations of reflection, in terms of which it refuses to criticize or solve the problems of reflection. As we have seen, both operations are intrinsically speculative.<sup>33</sup>

Rather, by focusing

on an analysis of those heterogeneous instances that are the 'true' conditions of possibility of reflection and speculation without being susceptible to accommodation by the intended totality, Derrida's philosophy reinscribes, in the strict meaning of this word, reflection and speculation into what exceeds it: the play of the infrastructures.<sup>34</sup>

How can infrastructures be more fully described?

Infrastructures are economically and strategically minimal distributions or constellations—archesyntheses—of essentially heterogeneous predicates. The principle articulated by each singular infrastructure applies to itself as well, and although each one of the by right infinite number of infrastructures can be replaced (or supplemented) by another, they are not synonymous with or even identical to one another. Thus one can see clearly how infrastructures contain the *possibility* of tying elements together into a totality of foundation, as well as of self-thematization and of element combination and transformation.<sup>35</sup>

Gasché next sounds a warning.

Since infrastructures combine heterogeneous predicates, however, and apply to themselves only the better to unground themselves, they also appear to be strangely ambiguous or ambivalent. Yet it is not the sort of ambiguity that would be witness to an absence of clarity in the process of their determination, to the negativity of a lack of precision, to vagueness or looseness of terms, in short to semantic confusion, nor is it an ambiguity concerning the meaning of the infrastructures, owing to some polysemic richness. Ambiguity in these senses is always a function of presence—that is, of an ultimately self-identical signification—as is demonstrated by the possibility of the dialectical sublation of ambiguous meanings, whereas

the ambiguity of the infrastructures is not the positive sign of a dialectical or speculative state of affairs. . . . The specific ambiguity of the infrastructures cannot be sublated or made to sound in unison. If determinacy requires self-identify, then the ambiguity of the infrastructures has no boundaries.

Therefore, "it is advisable to avoid the term *ambiguity* altogether in characterizing the infrastructures" and to qualify them "provisionally as undecidables"<sup>36</sup>—a word which

must be understood to refer not only to essential incompleteness and inconsistency, bearing in mind their distinction from ambiguity, but also to indicate a level vaster than that which is encompassed by the opposition between what is decidable and undecidable.<sup>37</sup>

Consequently,

As "originary" syntheses, or economic arrangements of traits, the undecidables constitute both the medium or the element between the binary philosophical oppositions and between philosophy and its Other, as well as the medium that encompasses these coupled terms. They are undecidable because they suspend the decidable opposition between what is true and false and put all the concepts that belong to the philosophical system of decidability into brackets. By virtue of their constituting a space in between conceptual dyads and, at the same time, comprising them, the infrastructural undecidables are "the medium in which opposites are opposed, the movement and the play that links them among themselves, reverses them or makes one side cross over into the other" (*D*, p. 127). Their undecidability, their "floating indetermination," permits the substitution and the play of the conceptual binary oppositions, which, by turning into one another, become incapable of denominating and defining the medium from which they emerge (*D*, p. 93). Thus, if one calls infrastructures "ambivalent" or "ambiguous," it is in the sense that they do not offer themselves to mastery in terms of simple and clear-cut distinctions. Indeed, conceptual couples and their play essentially represent nothing other than the attempt to bring the play of the medium of the undecidables to a stop, to make rational what, according to their implicit and explicit ethos, can only be irrational, to appropriate it, to identify it by forcing a self-identity upon it. The restricted play of the philosophical conceptual couples proceeds to this task by trying to reconstitute the undecidables as dialectical contradictions susceptible of eventual dissolution; but, Derrida notes, undecidability "is not contradiction in the Hegelian form of contradiction" (*P*, p. 101). The undecidables, on the contrary, are what suspend decidability in all its forms, particularly in its dialectical form of a mediation of contraries *and* of that in which

decidability and definiteness carve themselves out. Above all, the "ambiguity" of undecidables is rigorously irreducible and irresolvable because of its essentially *nonsemantic* character.<sup>38</sup>

## II. "How to Avoid Speaking: Denial"

Before interpreting this chapter of Derrida<sup>39</sup> on negative theology and related topics, let us set down points from our previous section which may contribute to that interpretation. (a) Onto-theology and its partner, negative theology, are instances of the reflections or (literally) speculations on the surface of the human mirror which is the mind (see note 30 above). (b) But those reflections are made possible and are affected by the tain of the mirror—i.e., by the infrastructures which are located on succeeding levels of that tain and which allow the reflections to occur (see notes 31–34 above). (c) These infrastructures are negative discourse; they are constellations of heterogeneous predicates (see note 34), grounded in such a way as to be open-ended to further combination and transformation (see note 35). (d) Or one may substitute "undecidables" for "infrastructures" and say that reflections on the mirror's surface are made possible by undecidables (see note 36). These are the medium between philosophy and theology in such a way as to encompass both; they suspend the opposition between what is true and false, between possible and impossible; they are the space between these latter conceptual dyads and yet comprise them; they are the medium within which opposites are opposed, linked together and reversed; they are floating indeterminates which allow conceptual oppositions to combine (thus neither of them dominates) and to make rational what can only be irrational by trying to reconcile undecidables; they are the philosophical and theological conceptual couples which can be misconstrued as dialectical contradiction susceptible (with Hegel) of eventual dissolution; they suspend decidability in all its forms but especially as a mediation of contradictions; because nonsemantic in character these are rigorously irreducible and irresolvable (see note 38 above).

Perhaps some of those points may help us in interpreting Derrida's comments on avoiding speaking through denial. His chapter shows itself to consist of two main parts, the first of which runs from p. 73 to p. 96, the second from p. 96 to p. 131. In the first he considers negative theology as traditionally understood (e.g., is it one or multiple?) and practiced by Pseudo-Dionysius and by Meister Eckhart. He then faces

three objections leveled at himself: he is a nihilist or, at least, an obscurantist; he speaks solely for the sake of speaking and writing; granted that negative discourse is not sterile or obscurantist, but it might make all discourse theology if "God" is the truth of any negativity (see pp. 75–77). His answering those objections occurs in two stages: by speaking of negative theology first in general (pp. 77–82) and second in greater detail with reference to "promise" and "secret" (pp. 82–96).

The second main part of his chapter begins with a consideration of place (e.g., Jerusalem, where the colloquium is to take place); figurative spatialization in speech and writing and in meaning and reference; the rhetorical *topoi* which concern apophatic procedures (pp. 96–100). These pages lead into three subordinate parts concerned with three paradigms of negative theology, the first of which (pp. 100–108) centers on the *epekeinas tēs ousias* of Plato's *Republic* (509B sqq.) and on the *khōra* of his *Timaeus* (48E sqq.), the second (pp. 108–22) on the nonexperiential experience of the *khōra* and on Christian *via negativa*, the third (pp. 122–31) on Heidegger's writing and reading *Sein* under erasure.<sup>40</sup>

Now let us turn to the chapter itself, "How to Avoid Speaking: Denial," where Derrida mixes comments on traditional negative theology with his own replacement of it by never-ending negation. Let us reread his pages 74 and 75, where he describes negative theology as traditionally understood, followed by his deconstruction of it.<sup>41</sup> [a] Negative theology (he begins) considers "that every predicative language is inadequate to the essence, in truth to the hyperessentiality (the being beyond Being) of God; consequently, only a negative ('apophatic') attribution can claim to approach God, and to prepare us for a silent intuition of God." [b] Accordingly, "one would recognize some traits, the family resemblance of negative theology, in every discourse that seems to return in a regular and insistent manner to this rhetoric of negative determination, endlessly multiplying the defenses and the apophatic warnings." [c] Hence, *X* (whatever that may stand for) "is" neither this nor that, neither sensible nor intelligible, neither positive nor negative, neither inside nor outside, neither superior nor inferior, neither active nor passive, neither present nor absent, not even neutral, not even subject to a dialectic with a third moment, [*X* is] without any possible sublation ('*Aufhebung*').<sup>42</sup> [d] Despite appearances, then, "this *X* is neither a concept nor even a name; it does *lend itself* to a series of names, but calls for another syntax, and exceeds even the

order and the structure of predicative discourse. It 'is' not and does not say what it 'is.' It is written completely otherwise."<sup>42</sup>

But on page 76 Derrida sketches what seems to deconstruct negative theology by substituting negativity (and, in this context, God even) for it. [e] "Once the apophatic discourse is analyzed in its logical-grammatical form," ... it perhaps leads us to consider the becoming-theological of all discourse. From the moment a proposition takes a negative form, the negativity that manifests itself need only be pushed to the limit, and it at least resembles an apophatic theology. [f] Every time I say: X is neither this nor that, neither the contrary of this nor of that... I would start to speak of God, under this name or another. God's name would then be the hyperbolic effect of that negativity or all negativity that is consistent in its discourse. God's name would suit everything that may not be broached, approached or designated, except in an indirect and negative manner. Every negative sentence would already be haunted by God or by the name of God, the distinction between God and God's name opening up the very space of this enigma. If there is a work of negativity in discourse and predication, it will produce divinity." [g] In fact, though, "divinity is not produced but productive. Infinitely productive. Hegel would say.... God would be not merely the end, but the origin of this work of the negative. Not only would atheism not be the truth of negative theology; rather, God would be the truth of all negativity. [h] One would thus arrive at a kind of proof of God... by His effects, or more precisely a proof of what one calls God... by effects without cause, by the *without cause*.... In the absolutely singular logic of this proof, 'God' would name *that without which* one would not know how to account for any negativity: grammatical or logical negation, illness, evil and finally neurosis which far from permitting psychoanalysis to reduce religion to a symptom, would obligate it to recognize in the symptom the negative manifestation to God. [i] Without saying that there must be at least as much 'reality' in the cause as in the effect,... one would see... in the negation or suspension of the predicate, even of the thesis of 'existence'—the first mark of respect for a divine cause which does not even need 'to be.' [j] And those who would like to consider 'deconstruction' a symptom of modern or postmodern nihilism could indeed, if they wished, recognize in it the last testimony—not to say martyrdom—of faith in the present *fin de siècle*. This reading will always be possible. Who could prohibit it? In the name of what?"<sup>43</sup>

In summary we can say that statements #a–#d above are a recognizable presentation of traditional negative theology: as transcending being, God also transcends affirmative predications (#a–#b), and allows one to make negative predications at best (#c–#d). But statements #e–#j eliminate even negative predications (#f) and "God" no longer names transcendent being but stands for negation itself (#g), whether grammatical or logical, whether the privation of physical, moral or mental health (see #h–#i). So understood, deconstruction is not nihilism but the sole testimony of or martyrdom for "faith" in these our final days (#j).

Does Derrida provide further information? Yes, seemingly, while attending to the *khôra* which Plato introduces in *Timaeus* 48E as a "third species."<sup>44</sup> [k] Neither subsistent Form nor image of a Form, *khôra* is "this absolutely necessary place" in which the images "of the eternal beings originate by impressing themselves there.... At the moment, so to speak, when the demiurge organizes the cosmos by cutting, introducing and impressing the images of the paradigms 'into' the *khôra*, the latter must already have been *there*, as the *there* itself, beyond time or in any case beyond becoming, in a beyond time without common measure with the eternity of the ideas and the becoming of sensible things." But "how does Plato deal with this disproportion and heterogeneity?" There are, for Derrida, "two concurrent languages in these pages of the *Timaeus*."<sup>45</sup>

[l] "One of these languages multiplies the negations, the warnings, the evasions, the detours, the tropes, but *with a view* to reappropriating the thinking of the *khôra* for ontology and for Platonic dialectic in its most dominant schemas. If the *khôra*... is neither sensible nor intelligible, it seems to *participate* in the intelligible in an enigmatic way (*Timaeus* 51A). Since it 'receives all,' it makes possible the formation of the cosmos. As it is neither this nor that (neither intelligible nor sensible), one may speak as if it were a joint participant in both. *Neither/nor* easily becomes *both/and*, both this and that." [m] Because of Aristotle, *Physics* IV, "one has always interpreted this passage on the *khôra* as being at the *interior* of philosophy.... The *khôra* is the atemporality of the spacing; it (a)temporalizes, it calls forth atemporality, provokes it immutably from the pretemporal *already* that gives place to every inscription."<sup>47</sup>

[n] The other language one finds in the *Timaeus* "and the other interpretive decision, without ceasing to be atemporal or anachronistic in their way... would inscribe an irreducible spacing interior" but

also exterior to Platonism. "Under the name of *khôra* the place belongs neither to the sensible nor to the intelligible, neither to becoming nor to non-being ... nor to Being." [o] And all such aporias "would signify that *there is* something that is neither a being nor a nothingness; something that no dialectic, participatory schema, or analogy would allow one to rearticulate together with any philosopheme whatsoever, neither 'in' Plato's works nor in the history that Platonism inaugurates and dominates. The *neither/nor* may no longer be reconverted into *both...and*. Hence, the so-called 'metaphors' are not only inadequate, in that they borrow figures from the sensible forms inscribed in the *khôra*, without pertinence for designating the *khôra* itself. They are no longer metaphors."<sup>44</sup>

[p] Yet to say that "Plato does not use metaphor or sensible figures to designate the place does not imply that he speaks appropriately of the proper and properly intelligible meaning of *khôra*. The import of receptivity or of receptacle which, one may say, forms the elementary nonvariable of this word's determination, seems to me to transcend the opposition between figurative and proper meaning. The spacing of *khôra* introduces a dissociation or a difference in the proper meaning that it renders possible."<sup>45</sup> [q] "Radically nonhuman and atheological [as the *khôra* is], one cannot say that it gives place or that *there is* the *khôra*.... It does not give place as one would give something, whatever it may be; it neither creates nor produces anything, not even an event insofar as it takes place. It gives no order and makes no promise. It is radically ahistorical, because nothing happens through it and nothing happens to it. Plato insists on its necessary indifference; to receive all and allow itself to be marked or affected by what is inscribed in it, the *khôra* must remain without form and without proper determination. But if it is amorphous (*Timaeus* 50D), this signifies neither lack nor privation. *Khôra* is nothing positive or negative. It is impassive, but it is neither passive nor active."<sup>46</sup>

What can be said of the preceding paragraphs #k to #q? Derrida's remarks there on the *khôra* of Plato's *Timaeus* 48E sqq. present, in an admittedly opaque manner, a twofold interpretation of negative theology and of its deconstruction parallel to that found above in paragraphs #a to #j. That is, paragraphs #k to #q investigate the two languages running concurrently in Plato's description of *khôra* (#k), the first of which (#l-#m) concerns Platonisms as positions corresponding to onto-theologies and negative theologies.<sup>47</sup> Although itself neither Form nor image of a Form, *khôra* is the indispensable place in which

those images originate from the Forms as models and from the agency of the divine demiurge (#k). As atemporal space, the *khôra* thus makes possible, even though it itself is neither sensible nor intelligible nor temporal, "the formation of the cosmos" by receiving all *as if* it were a joint participant of sensibility and intelligibility (#m).

The second language (#n-#q) which the *Timaeus* speaks concerns the *khôra* as that which is beneath even negations: "there is something that is neither a being nor a nothingness," something that escapes the dialectics, participation and analogy Plato or later Platonisms might use to appropriate it.<sup>48</sup> something which escapes even metaphors (#n-#o). *Khôra*, although termed receptivity or receptacle, "transcends the opposition between figurate and proper meaning" and inserts "dissociation" or "difference" into language (#p). "Radically nonhuman and atheological" and "ahistorical" as it is, one cannot say even that the *khôra* is or that it gives place to anything or that it produces any event. Of itself it is without form or determination. It is neither positive nor negative, neither passive nor active (#q).

What do my two immediately preceding paragraphs establish? The two languages running concurrently in Plato's depiction of the *khôra* (*Timaeus* 48E sqq.) parallel Derrida's presentation earlier of traditional negative theology (#a-#d) and its deconstruction through elimination even of negative predications themselves (#e-#j). What grounds that parallel? The fact that the *khôra*, although neither Form nor image nor God and although neither sensible nor intelligible nor temporal, provides place within which the images originate from the Forms and from divine agency so as to form this cosmos and so as (even more relevantly) to ground Platonic onto-theologies and Neoplatonic negative theologies (see #l-#m). Second, the *khôra* as neither being nor nothingness also lies beneath the negations of traditional apophatic theologies and thus cannot be appropriated by Platonisms—it eludes dialectics, participation, analogy, metaphor, literal and figurative speech; it inscribes dissociation and difference into language (see #n-#q above).

What then does the factor eliminating even negative predications (an elimination which Derrida himself names "deconstruction"—see #j above) have in common with *khôra* as the underground which no Platonism as such can appropriate? Apparently that factor would correspond to the "tain" of which we spoke above (see paragraphs linked with notes 30 sqq.). The tain of the mirror makes possible the reflections (which correspond to traditional onto-theologies) on its surface—a

possibility which issues from the infrastructures or undecidables (e.g., différance, re-mark, arche-trace, iterability, supplementarity) on succeeding levels of the tain (see initial paragraph linked to note 39 above). Similarly, the deconstructive elimination of negative predications and, then, the *khôra* of the *Timaeus* each makes possible the traditional onto-theologies, which however rest upon the endlessly deepening levels of negativity.<sup>53</sup>

If my interpretation is accurate, deconstructionists might well be pictured as terminating each day in a silence of exhaustion from having been endlessly thinking, speaking, writing otherwise than whatever precedes. Their silence would (I might add and as I hope to show presently) be in contrast to that of Plotinus, Pseudo-Dionysius and other Neoplatonists, who terminate each day in a sacred silence of adoration of the God who exists but transcends being and knowledge.

If one were asked why the former group ends up exhausted each day, it is because of where they start. If in knowing you begin with Descartes by liberating yourself from objects (i.e., from actual existents in concrete cases) and next from even the experience itself of such objects, you then are confined to language (spoken or written), to texts, to textual exegesis but with nothing outside to control meaning. The result? One either sells cars or plays computer games or, if one is an academic, goes below texts to endlessly deepening levels of deconstruction, of differing and deferring.<sup>54</sup> One never reaches the last word: there is no last word, there is always another word afterwards.

Now let us briefly turn to Neoplatonism and to the silent adoration of God one can find there.

### III. Neoplatonism and Negative Theology

In contrast to Jacques Derrida, Neoplatonic expositions of God and of negative theology are relatively simple and clear because reality (= value, worth) for every Neoplatonist consists in unity: to be real is to be one.

#### *Plotinus*

As a first example consider Plotinus (205–270), the founder of Neoplatonism.<sup>55</sup> According to him to be real is to be one, with the result that God *is* the One and all else emanating from God (e.g., Intellect and intellects, Soul and souls) are real to the extent that they are the-One-on-a-lower-level. Since Being is a combination of

one-many (= the emanated level of Intellect) and Becoming a combination of many-one (= the emanated level of Soul), God transcends being (as well as what is linked with being—namely, intellection, life, eternity, immutability) and becoming (together with what is linked with becoming—namely, reasoning, sensation, time, motion). Thus God escapes all descriptions—including, finally, that of “unity” too.<sup>56</sup> Consequently with Plotinus it is best to be in a state of silent adoration of the actually existing God,<sup>57</sup> who is entirely above entity, knowledge and language. This silence of adoration continues until I become literally one with God and thereby I am truly and fully real (although there is no “I” any longer, which was a burden, an imperfection, an unreality anyway). In any human person’s state of union with God

there were not two, but the seer himself was one with the Seen (for it was not really seen but united to him).... He was one himself then, with no distinction in him either in relation to himself or to anything else; for there was no movement in him, and he had no emotion, no desire for anything else when he had made the ascent, no reason or thought; his own self was not there for him, if we should say even this. He was as if carried away or possessed by a god, in a quiet solitude, in the stillness of his being turning away to nothing and not busy about himself, altogether at rest and having become a kind of rest. He did not belong to the realm of beauties but had already passed beyond Beauty [which is on the level of Intellect].... [After his contemplation and intimacy with God—but perhaps that] was not a contemplation but another kind of seeing, a being out of oneself [*ekstasis*], a simplifying, a self-surrender, a pressing toward contact, a rest, a sustained thought directed to perfect conformity [and identity with God].... Before the vision [one has of God] one seeks what is beyond the vision, and what is beyond the vision is that which exists [*to ho estin*] before all [= God].... When a soul travels [away from matter] it comes, not to something else, but to itself; and so when it is not in anything else it is in nothing but itself. But when it is in itself alone it is not in being, it is in That [= God]; for one becomes oneself not as being but beyond being by that intercourse.... This is the life of gods and divine and blessed men, deliverance from the things of this world, a life which takes no delight in things of this world, escape in solitude to the Solitary.<sup>58</sup>

#### *Dionysius the Pseudo-Areopagite*

If one can prudently locate Dionysius as *florens* between 485 and 533,<sup>59</sup> he obviously postdates Plotinus by two centuries and has been subjected to influences (both pagan and Christian) of which the former is free.<sup>60</sup> But the basic constituents of Neoplatonism are still there.

Consider Dionysius' address to his friend Timothy in *The Mystical Theology* [hereafter: *MT*].

[a] My advice to you as you look for a sight of the mysterious things, is to leave behind you everything perceived and understood, everything perceptible and understandable, all that is not and all that is, and, with your understanding laid aside, to strive upward as much as you can toward union with him who is beyond all being and knowledge. By an undivided and absolute abandonment of yourself and everything, shedding all and freed from all, you will be uplifted to the ray of the divine shadow which is above everything that is.<sup>61</sup>

After warning Timothy not to disclose what had just been said to "the uninformed, that is to say, to those caught up with the things of the world," Dionysius speaks of God as [b] "the transcendent cause of all things." Since it is

cause of all beings, we should posit and ascribe to it all the affirmations we make in regard to beings, and, more appropriately, we should negate all these affirmations, since it surpasses all being. Now we should not conclude that the negations are simply the opposites of the affirmations, but rather that the cause of all is considerably prior to this, beyond privations, beyond every denial, beyond every assertion (*MT*, p. 135).

[c] This transcendent cause

of all is both eloquent and taciturn, indeed wordless. It has neither word nor act of understanding, since it is on a plane above all this, and it is made manifest only to those who travel through foul and fair, who pass beyond the summit of every holy ascent, who leave behind them every divine light, every voice, every word from heaven, and who plunge into the darkness where, as scripture proclaims, there dwells the One who is beyond all things (*ibid.*).

[d] Elsewhere, he continues, I have

praised the notions which are most appropriate to affirmative theology. I have shown the sense in which the divine and good nature is said to be one and then triune, how Fatherhood and Sonship are predicated of it, the meaning of the theology of the Spirit, how these core lights of goodness grew from the incorporeal and indivisible good, and how in this sprouting they have remained inseparable from their co-eternal foundation in it, in themselves, and in each other. I have spoken of how Jesus, who

is above individual being, became a being with a true human nature (*MT*, ch. 3, pp. 138–39).

Such are the concerns of affirmative theology.

[e] But there is also a negative theology.

The more we take flight upward, the more our words are confined to the ideas we are capable of forming; so that now as we plunge into that darkness which is beyond intellect, we shall find ourselves not simply running short of words but actually speechless and unknowing.... My argument now rises from what is below up to the transcendent, and the more it climbs, the more language falters, and when it has passed up and beyond the ascent, it will turn silent completely, since it will finally be at one with him who is indescribable (*MT*, ch. 3, p. 139).

Dionysius recapitulates.

[f] The Cause of all is above all and [yet] is not without entity, lifeless, speechless, mindless. It is not a material body, and hence has neither shape nor form, quality, quantity, or weight. It is not in any place and can neither be seen nor be touched. It is neither perceived nor is it perceptible. It suffers neither disorder nor disturbance and is overwhelmed by no earthly passion. It is not powerless and subject to the disturbances caused by sense perception. It endures no deprivation of light. It passes through no change, decay, division, loss, no ebb and flow, nothing of which the senses may be aware. None of all this can either be identified with it nor attributed to it (*MT*, ch. 4, pp. 140–41).

[g] Again, as we climb higher we say this. It is not soul or mind, nor does it possess imagination, conviction, speech, or understanding. Nor is it speech per se, understanding per se. It cannot be spoken of and it cannot be grasped by understanding. It is not number or order, greatness or smallness, equality or inequality, similarity or dissimilarity. It is not immovable, moving, or at rest. It has no power, it is not power, nor is it light. It does not live nor is it life. It is not an entity, nor is it eternity or time. It cannot be grasped by the understanding since it is neither knowledge nor truth. It is not kingship. It is not wisdom. It is neither one nor oneness, divinity nor goodness. Nor is it a spirit, in the sense in which we understand that term. It is not sonship or fatherhood and it is nothing known to us or to any other being. It falls neither within the predicate of nonbeing nor of being. Beings do not know it as it is being and it does not know them as they are beings. There is no speaking of it, nor name nor knowledge

of it. Darkness and light, error and truth—it is none of these. It is beyond assertion and denial. We make assertions and denials of what is next to it, but never of it, for it is both beyond every assertion, being the perfect and unique cause of all things, and, by virtue of its preeminently simple and absolute nature, free of every limitation, beyond every limitation; it is also beyond every denial (*MT*, ch. 5, p. 141).

### Commentary

Dionysius' communication to Timothy is rich with details and yet is comparatively clear. God, who is the transcendent cause of all beings (#b, #f), resides in the darkness (#c, #e; also see #a) above all affirmations and denials (#b, #g) and above all our intellections and language (#e). Theology nonetheless can be characterized as affirmative and as negative. The first describes the descending journey the divine and good nature undertakes from darkness to illuminations, which are God first as triune (Father, Son, Holy Spirit) and then as the incarnate Jesus (see #d) and which continue on in and through the celestial and the ecclesiastical hierarchies.<sup>62</sup> On the other hand, negative theology ascends from and through both these until it rises above not only all material and spiritual existents (#e, #g) but also the trinity and divinity (#g) and thereby achieves complete silence so as finally to be one with the Indescribable (#e). Accordingly, Dionysius' achievement seemingly parallels Plotinus': silent adoration terminating in final oneness of self and God.

How different is the journey a human person thus takes in Neoplatonism and in deconstruction: sacred silence and identification in contrast to descent into an endless shifting and sifting of words.<sup>63</sup>

Let me conclude with the prayer (prior to Text #a above) with which Dionysius begins his treatise *Mystical Theology* and which Derrida repeats after adding these introductory words: "Dionysius addresses himself directly to You, to God, from now on determined as 'hyperessential Trinity' in the prayer that prepares the theologemes of the *via negativa*":

O Trinity beyond being (*Trias hyperousiè*), beyond divinity (*hyperthèe*), beyond goodness (*hyperagathè*), and guide of Christians in divine wisdom (*theosophias*), direct us to the mystical summits more than unknown and beyond light. There the simple, absolved, and unchanged mysteries of theology lie hidden in the darkness beyond light of the hidden mystical silence, there, in the greatest darkness, that beyond all that is most evident exceedingly illuminates the sightless intellects. There, in the wholly imperceptible

and invisible, that beyond all that is most evident fills to overflowing, with the glories beyond all beauty the intellects who know how to close their eyes (*tous anemmatous noas*). This is my prayer ('*Emoi men our tauta eutkhô*). And you, dear Timothy, be earnest in the exercise of mystical contemplation. (ch. 1: 998a)<sup>64</sup>

At the end of the prayer Derrida adds these comments.

What happens here?

After having prayed (he [Dionysius] writes, we read), he presents his prayer. He quotes it and I have just quoted his quotation. He quotes it in what is properly an *apostrophe* to its addressee, Timothy. The *Mystical Theology* is dedicated to him; in order to initiate him, it must lead him on the paths toward which Dionysius himself has prayed to God to lead him, or more literally to *direct* him in a straight (*ithunon*) line. A pedagogy which is also a *mystagogy* and a *psychagogy*: here the gesture of leading or directing the *psyche* of the other passes through *apostrophe*. The one who asks to be led by God turns for an instant toward another addressee, in order to lead him in turn. He does not simply turn himself away from his first addressee who is in *truth* the first Cause of his prayer and already guides it. It is exactly because he does not turn away from God that he can turn toward Timothy and *pass from one address to the other without changing direction*.<sup>65</sup>

If only Derrida had himself traveled that straight-line path, which is at once a pedagogy, a psychagogy and a mystagogy! That path would have terminated in a silent adoration of and unity with the subsistent and yet transcendent God instead of ending in the silence of ennui, which a deconstructionist experiences today while awaiting tomorrow's similar exhausting pursuit of sifting and shifting words, of differing and deferring.

I acknowledge with gratitude the help of Matthew Edgar and Brent Adkins in researching and writing this paper.

Pells, *The Liberal Mind in a Conservative Age: American Intellectuals in the 1940s and 1950s* (New York: Harper and Row, 1985); Eric Gans, *The End of Culture: Toward a Generative Anthropology* (Berkeley: University of California Press, 1985); Daniel Bell, “American Intellectual Life, 1965–1992,” *The Wilson Quarterly* (Summer 1992), 74–107.
18. New York: Alfred A. Knopf, 1994. Hereafter I shall refer to Himmelfarb’s book as *Looking into the Abyss*.
19. *Ibid.*, p. 13.
20. *Ibid.*, p. 133. For an exposition of Richard Rorty’s “light-minded” pragmatism, which allows him to believe “there is no fixed or fundamental principle, no ‘essential’ truth or reality” and thus philosophy is not an independent discipline (*ibid.*, p. 14), but is to be replaced by a “light-minded aestheticism,” which extends even to morality so that the historical account of Hitler’s persecution of the Jews is to be read as a novel, see *ibid.*, pp. 13–17. This deconstructing of history (pp. 17 sqq.) is at the core (and rightly so, I would say) of Himmelfarb’s rejection of Derrida and other deconstructionists.
21. *New York Times Book Review*, March 6, 1994, pp. 11–12.
22. New York: Poseidon Press, 1991.
23. The final count is 180 articles—170 published in *Le Soir* and ten more in *Het Vlaamsche Land*—see Lehman, p. 165.

24. Edited by W. Hamacher, N. Hertz and T. Keenan (Lincoln: University of Nebraska Press, 1989). Derrida's chapter is on pp. 127–64. For Himmelfarb's evaluation of his chapter, see *Looking into the Abyss*, pp. 19–23.
  25. See D. Lehman, ch. 10, pp. 245–58, for reactions to Derrida's attempted exoneration. In a private conversation, Brent Adkins (see bibliography below) preferred to express Derrida's reaction to P. de Man's 1940–42 writings not as an exoneration but as demonstrating the undecidable matrix out of which the writings of de Man could occur but at the same time as deconstructing that writing.
  26. Quoted by Derrida, *Negative Theology*, p. 289. For data on Silesius, see *ibid.*, p. 322, n. 3. Also see n. 4 above.
  27. For bibliographical data on the first appearance in 1987 of this definition of deconstruction, see *ibid.*, p. 323, n. 5.
  28. Rodolphe Gasché, *The Tain of the Mirror: Derrida and the Philosophy of Reflection* [hereafter: *Tain*] (Cambridge, Mass.: Harvard University Press, 1986), p. 13. For review of *Tain* see Henry Staten, *Criticism* 30 (1988), 144–49; Charles Altieri, *Comparative Literature Studies* 26 (1989), 376–84; Christopher Fynsk, *Review of Metaphysics* 41 (1987), 137–39; John D. Caputo, *Research in Phenomenology* 17 (1987), 245–59.
- In contrast to the Cartesian methodology which Gasché applies to modern philosophers, Aristotle's and Aquinas's epistemologies consist of "straightforward consideration of objects," which are the content-determining-causes of all nonconstructural knowledges, by and in which we are one with the known. See L. Sweeney, S.J., *Christian Philosophy: Greek, Medieval, Contemporary Reflections* [hereafter: *Christian Philosophy*] (New York/Bern: Peter Lang Publishing, Inc., 1997), ch. 21: "Preller and Aquinas: Second Thoughts on Epistemology," pp. 537–62.
29. *Tain*, p. 14.
  30. *Ibid.*, pp. 6 and 7. When speaking of Hegel, Derrida himself (*Dissemination*, pp. 32–33) alludes to *tain*: "It is because we have now arrived at the point where the relation between the 'text'—in the narrow, classical sense of the term—and the 'real' is being played out, and because the very concepts of text and of extratext, the very transformation of the relation between them and of the preface we are engaged in, the practical and theoretical problematic of that transformation, are at stake. The new kind of text that retains and seems to limit us here is in fact the infinite excess facing [*débord*] of its classical representation. This lining fringe, this extra edge, this de-limitation, invites ■ rereading of the form of our relation to Hegel's logic and to all that can be subsumed therein. The breakthrough toward radical otherness (with respect to the philosophical concept—of the

concept) always takes, *within philosophy*, the *form* of an a posteriority or an empiricism. But this is an effect of the specular nature of philosophical reflection, philosophy being incapable of inscribing (comprehending) what is outside it otherwise than through the appropriating assimilation of a negative image of it, and dissemination is written on the back—the *tain*—of that mirror. Not on its inverted specter. Nor in the triadic symbolic order of its sublimation. The question is to find out what it is that, written under the mask of empiricism, turning speculation upside down, *also does something else* and renders a Hegelian sublation [*relève*] of the preface impracticable. This question calls for prudent, differentiated, slow, stratified readings."

31. *Tain*, p. 238. On the "structurally limitless play of the undecidables," see R. Gasché, "Nontotalization without Spuriousness: Hegel and Derrida on the Infinite," *Journal of the British Society for Phenomenology* 17 (1986), 289–307, where Gasché lists Derrida's statements on the "infinite substitutability" which characterizes language and texts and which aborts "all possible totalization" of language or texts (p. 289).
- "Infinity" as Derrida uses it is similar to Aristotle's use, for whom any actual extension is always definite but is potentially infinite as capable of further bisection. See L. Sweeney, *Divine Infinity in Greek and Medieval Thought* [hereafter: *Divine Infinity*] (New York/Bern: Peter Lang Publishing, Inc., 1998), ch. 8: "Aristotle's Infinity of Quantity," pp. 143–65.
32. *Tain*, p. 238.
  33. *Ibid.*, pp. 238–39.
  34. *Ibid.*, p. 239.
  35. *Ibid.*, pp. 239–40.
  36. *Ibid.*, p. 240.
  37. *Ibid.*, p. 241.
  38. *Ibid.*, pp. 241–42. In the quotation, "D, p. 127," "D, p. 93" and "P, p. 101" refer to Derrida's *Dissemination*, trans. B. Johnson (University of Chicago Press, 1981), and *Positions*, trans. B. Harlow (University of Chicago Press, 1971).
  39. *Negative Theology*, pp. 73–142 (see n. 2 above). In the points to be made now, my parenthetical references to note 30, etc., should be read as referring to "the paragraph corresponding to note 30 above," etc.
  40. See *ibid.*, pp. 125–29. On erasure in Derrida, see *ibid.*, pp. 260–61; Kevin Hart, *The Trespass of the Sign: Deconstruction, Theology and Philosophy* (Cambridge University Press, 1989), "Erasure and palaeonymy," pp. 128–37. See *ibid.*, pp. 123–24 (especially n. 33), with reference to the "possible/impossible," which is discussed in the prgrs. corresponding to my n. 27 above.

41. Lowercase letters are bracketed in subsequent paragraphs to make references easier.
42. "How to Avoid," p. 74.
43. See #a-#d in previous prgr.
44. "How to Avoid," pp. 76-77.
45. Plato in the *Timaeus* names this third aspect of physical reality not only *khôra* but also "receptacle," "nurse," "mother," "pliable stuff," "necessity." For references to the Greek text and to secondary literature, see L. Sweeney, "Participation in Plato's Dialogues," *Divine Infinity*, pp. 142-46.
46. "How to Avoid," p. 104.
47. *Ibid.*, pp. 104-5.
48. *Ibid.*, pp. 105-6.
49. *Ibid.*, p. 106.
50. *Ibid.*, pp. 106-7.
51. The Neoplatonism of Pseudo-Dionysius and others would fit here.
52. See previous note.
53. Another correspondent to *tain* and *khôra* is the "Mystic Writing Pad," which Freud compared to the unconscious in a human psyche. Why so? Because the pad offers an "ever-ready receptive surface and permanent traces of the inscriptions that have been made upon it" ("A Note upon the 'Mystic Writing Pad' " [1925], quoted by Derrida, *Writing and Difference*, p. 223). For Derrida "the depth of the Mystic Pad is simultaneously a depth without bottom, an infinite allusion, and a perfectly superficial exteriority: ■ stratification of surfaces each of whose relation to itself, each of whose interior, is but the implication of another similarly exposed surface. It joins the two empirical certainties by which we are constituted: infinite depth in the implication of meaning, in the unlimited envelopment of the present, and, simultaneously, the pellicular essence of being, the absolute absence of any foundation" (*ibid.*, p. 224).
54. See Kevin Hart, *Trespass of the Sign*, p. 19: "Often Derrida does not read a text to put pressure on western metaphysics but rather to affirm those elements forgotten or repressed by previous readings. In other words he does not stop at showing that a text does overrun its limits, but he explores the streams, the runnels and deltas which that overflow causes, although with the sediment it brings to the surface only to deposit elsewhere."
55. Although Porphyry, Iamblichus and other later Neoplatonists diverge from Plotinus in their conceptions of soul and intellect, in their eschatologies and in their epistemology and logic, they do agree with him in their basic metaphysics: for all, to be real is to be one. See L. Sweeney, *Christian Philosophy*, pp. 416-31.

56. See *Enneads* V, 5 (32), 6, 16-37; L. Sweeney, *Divine Infinity*, pp. 185-86 and 236-37.
57. Although God is above entity, Plotinus explicitly states that He actually exists—see V, 5 (32), 13, 12-14: "If then one takes away everything and says nothing about him and does not say falsely about anything that it is with him, he allows him his 'existence' (*eiase to estin*) without attributing to him anything which is not there." Also see VI, 9, (9), 3, 51: *ekeinou ontos en hautô*. See L. Sweeney, *Divine Infinity*, pp. 240-41.
58. VI, 9 (9), 11, 4-51.
59. The first date is that of Proclus' death, whereas 533 is when Severus, the monophysite Patriarch of Antioch, quoted Dionysius for the first time. See Jaroslav Pelikan, "The Odyssey of Dionysian Spirituality," in *Pseudo-Dionysius, the Areopagite*, "The Classics of Western Spirituality" (New York: Paulist Press, 1987), pp. 11-24; Paul Rorem, *Biblical and Liturgical Symbols within the Pseudo-Dionysian Synthesis* (Toronto: Pontifical Institute of Mediaeval Studies, 1984), pp. 3-10; William J. Carroll, "Participation in Selected Texts of Pseudo-Dionysius the Areopagite's *The Divine Names*" (Ph.D. diss., The Catholic University of America, Washington, D.C., 1981), pp. 167-69, for a listing of "the many names in the history of thought with whom Dionysius has been identified," starting from the year 129 and ending with the year 544. Also see *ibid.*, pp. 4-15.
60. A major pagan influence on Dionysius is that of Proclus (410-485), whose theory of magical theurgy may have influenced Dionysius on the sacraments. Proclus' distinction (to some degree) of Being, Life and Intellect, as well as his structured theory of participation, certainly influenced Dionysius. See L. Sweeney, *Divine Infinity*, ch. 12: "Participation and the Structure of Being in Proclus' *Elements of Theology*," pp. 257-88. Also see R. T. Wallis, *Neoplatonism* (New York: Charles Scribner's Sons, 1972), p. 161: "The problem posed by the Dionysian corpus, despite its supposed Apostolic authority, was that its Neoplatonism was that of the more avowedly pagan Athenian School [= Proclus]; in particular Dionysius' angelology seems too reminiscent of the Athenian School's order of gods. Hence, his God tended to become merely the supreme term in the metaphysical hierarchy, and as such to be conceived as operating on the material world only through intermediaries. In this Dionysius echoed the ambivalent tendencies of pagan Neoplatonism and, what was perhaps even more serious, he seemed equally equivocal on the fundamental point separating Neoplatonic and Christian world-views, whether creation is a result of the divine nature or of a gratuitous act of grace. Hence his sacramentalism tended to lose its supernatural element and become hard to distinguish from pagan theurgy. Finally Dionysius

- seemed to pay too little attention to the Incarnation."
61. The translation is that of Colm Luibheid in "The Classics of Western Spirituality," *MT*, ch. 1, p. 135.
  62. The celestial hierarchies consist of three triads in this descending order: seraphim, cherubim, thrones; dominations, powers, virtues; principalities, archangels, angels. The ecclesiastical hierarchies consist also of three triads in this descending order: bishop, priest, deacon; monks, holy people, purified orders; catechumens, penitents, possessed. Both hierarchies have in common this definition: "A hierarchy is a sacred order, ■ state of understanding and an activity approximating as closely as possible to the divine. And it is uplifted to the imitation of God in proportion to the enlightenments divinely given to it.... The goal of a hierarchy, then, is to enable beings to be as like as possible to God and to be at one with Him.... Hierarchy causes its members to be images of God in all respects, to be clear and spotless mirrors reflecting the glow of primordial light and indeed of God himself. It ensures that when its members have received this full and divine splendor they can then pass on this light generously and in accordance with God's will to beings further down the scale" (*The Celestial Hierarchy*, ch. 3, pp. 153-54). Also see John Meyendorff, *Christ in Eastern Christian Thought* (Washington: Corpus Books, 1969), ch. 5: "Pseudo-Dionysius," pp. 68-84; Eric Perl, "Hierarchy and Participation in Dionysius the Areopagite and Greek Neoplatonism," *American Catholic Philosophical Quarterly* 68 (1994), 15-30; Jaroslav Pelikan, *The Christian Tradition: A History of the Development of Doctrine*, vol. 1, pp. 344-49.
  63. Different from both the Neoplatonic and the deconstructionist journeys is that of Thomas Aquinas, who starts from contingent material actual existents and rises to God as subsistent and infinite Existence—a philosophy and theology resting on the awareness that to be real is actually to exist. See last prgr. of n. 28 above; also L. Sweeney, *Authentic Metaphysics in an Age of Unreality*, 2d ed. (New York/Bern: Peter Lang Publishing, Inc., 1993), chs. 4-6.
  64. The translation is that given in "How to Avoid Speaking," p. 116.
  65. *Ibid.*, p. 117.

# Signifying Nothing: Being as Sign in Neoplatonism and Derrida

Eric D. Perl

The basis for the much-discussed connection between Neoplatonic negative theology and deconstruction<sup>1</sup> is not hard to see. Deconstruction is fundamentally a theory of signification, which attacks the (supposedly) traditional notion that a signifier (word, text, or image) refers to a signified, the meaning which the signifier expresses, and which itself is prior to and independent of the signifier. Derrida calls this the "transcendental signified": the meaning underlying the expression, the archetype underlying the image, that which is not sign but "pure signified." On the traditional assumption, any system of meaning, be it a written text or the cosmos itself, has such a transcendental signified. In the case of a text, it is the author's intent, what he means to express; in the case of the world, understood as a system of signs, it is God. In Derrida's much-quoted words, "The intelligible face of the sign remains turned toward the word and the face of God....The sign and divinity have the same place and time of birth."<sup>2</sup> The idea that the world has a transcendent ground is simply a special case of the traditional understanding of the relation of signifier to signified, so that God, for Derrida, is simply a version of the transcendental signified. Hence Derrida believes that in declaring the insuperable absence of the transcendental signified he is striking at the roots of traditional western metaphysics, characterized by Heidegger as "ontotheology."

For Derrida's project is to show that this entire theory of signification is wrong, that no "pure" or transcendental signified can ever be found, prior to and outside of the sign, text, or world. Whatever we posit as the pure meaning turns out to be another sign, constituted only within the system of signification, the "text," whose meaning it purports to be. This process of showing the meaning to be constituted only within and by the text to which it is

supposedly prior is precisely the activity of deconstruction. All we have, all we can ever have, then, is signs; we can never transcend signs to arrive at a pure signified which is not itself a sign. And it is here that the affinity between deconstruction and Neoplatonism becomes clear. For Neoplatonism, too, declares the radical and absolute inaccessibility of God, the One or the Good. Being is that which is intelligible, and this does not include God, who is "beyond being." Anything that can be thought, and hence all that is, is *ipso facto* not God but only an image, sign, or expression. God himself, the ultimate meaning underlying all expressions, the source and archetype of the world-image, is as absolutely unavailable, inexpressible, not belonging to the whole of reality, as deconstruction declares the transcendental signified to be. Hence Neoplatonism refuses to allow any name, word, concept, or thought—even, in the end, negative ones—to apply to God, and ends in utter silence. Thus the connection between negative theology and deconstruction lies in their common insistence that all that is, all that is available for thought, is sign; that no ultimate meaning, no transcendental signified, no pure presence, can be attained. But whereas for Neoplatonism this implies that the world is infinitely meaningful, the manifestation of God, for deconstructionism it implies that the world is meaningless.

Derrida has more than once found it necessary to deny that his own project is a version of negative theology, and has tried to articulate the difference between the two.<sup>3</sup> He argues that negative theology continues to posit a transcendental signified in that, in its very insistence that God is not (a) being but "beyond being," it is attempting, in his words, to "disengage ■ superessentiality," to locate a presence above and other than all beings, or signs.<sup>4</sup> But this reveals a fundamental misunderstanding of Neoplatonism.<sup>5</sup> Properly understood, Neoplatonic negative theology already anticipates and incorporates Derrida's insights into the nature of signification, and consequently offers an interpretation of transcendence and a view of the world as sign which is not subject to Derrida's critique of the entire western tradition as "metaphysics of presence." My own project, then, is not to adopt but rather to co-opt Derrida's postmodern arguments in favor of a fundamentally pre-modern, Neoplatonic vision of being as nothing but sign. We agree only in holding that all that is and is intelligible is nothing but sign and image, in our common denial of a God who is encountered

as a pure presence, an inner core of meaning which remains when all signs and expressions have been stripped away. In short, as the title suggests, my thesis might be summarized in the old quip that the only difference between ■ mystic and an atheist is that the mystic spells 'Nothing' with a capital 'N'.

## I

Derrida's argument may be said to begin with the simple idea that meaning is constituted by the "play of differences" within a system of signification. A sign can be meaningful only in virtue of its difference from other signs, so that difference is the "condition of signification."<sup>6</sup> Consequently, meaning can occur only in a system of mutually differentiated signs, or, in short, a "text." "This principle dictates to us...to consider every process of signification as a formal play of differences." This "play of differences" is what Derrida calls "différance." "The signified concept is never present in itself, in a sufficient presence which would refer only to itself. Every concept is...essentially inscribed in a chain or in a system in the interior of which it refers to the other, to other concepts, by systematic play of differences. Such a play, *la différance*, then, is no longer simply a concept but the possibility of conceptuality, of the conceptual system and process in general."<sup>7</sup> Différance, "which is neither a word nor a concept," is, we might say, the production of differences, and therefore of meaning. But this brings us to the crucial point. On the one hand, the system of signification depends on and is constituted by the differences within it. On the other hand, these differences occur only within, and are constituted by, the system itself. They cannot be present prior to, or apart from, the system of signs which they themselves determine. Différance founds the system, but itself takes place only within the system: "If *différance* (I also place the 'is' under erasure) that which makes possible the presentation of the being-present, it never presents itself as such. It never gives itself to the present."<sup>8</sup> It is neither one element within the system, nor outside of and prior the system, but is the production of the system itself. "We must therefore admit, before every dissociation language/word, code/message, etc., [in short, signifier/signified] ...a systematic production of differences, the *production* of a system of differences—a *différance*."<sup>10</sup> This

word "production" attempts to capture the indeterminacy between the active and the passive which, Derrida explains, is represented by the 'a' of "différance."<sup>11</sup> It is the *production* of the system: neither merely a prior cause which produces it nor an effect produced by it. Hence it is neither the system as a whole, nor any part of it, nor something else prior to it. The term 'différance' is a way of indicating our awareness of the system of signification as constituted by and consisting of differences, and of the differences as constituted by the system, so that no ultimate origin, or pure presence, can be identified.<sup>12</sup>

It is because meaning occurs only through difference and therefore within a system of differences that no transcendental signified can be found. "From the moment that there is meaning, there are nothing but signs. We *think only in signs*... One could call *play* the absence of the transcendental signified as limitlessness of play, that is to say as the destruction of ontotheology and the metaphysics of presence [*italics in original*]."<sup>13</sup> In opposition to this principle, Derrida describes what he regards as the traditional view of signification:

This layer of pure meaning or signified goes back...to a layer of pre-linguistic or pre-semiotic meaning...of which the presence would be thinkable outside of and before the work of *différance*, outside of and before the process or the system of signification. The latter would come only to bring the meaning to light, translating it, transporting it, communicating it, incarnating it, expressing it, etc.... Such a meaning... would therefore not be...inscribed in the relational and differential tissue. Metaphysics has always consisted...in wanting to pull out the presence of meaning, under this name or under another, from *différance*; and each time one claims to cut off or rigorously isolate a region or a layer of pure meaning or pure signified, one makes the same move.<sup>14</sup>

But this move is impossible, precisely because meaning cannot be torn out from difference: "In so far as that which is called the 'meaning' (to 'be expressed') is already...constituted of a tissue of difference, in so far as there is already a *text*..., a textual transformation in which each supposedly 'simple' term is marked by the trace of an other, the presumed interiority of the meaning is already worked by its own outside. It always already carries itself outside itself."<sup>15</sup> Thus, whenever a supposed "transcendental

signified" is posited, it turns out, necessarily, to be defined and constituted by difference, and therefore produced within the system, the text, to which it is supposedly prior and independent. This is why Derrida rejects the notion of a "subject," an interiority of thought or intent which then expresses itself outwardly in language. Quoting Saussure, he insists that "language...is not a function of a speaking subject." This implies that the subject...is inscribed in language, is a 'function' of language.<sup>16</sup> And again, "There is no subject who is the agent, author, and master of *différance*...Subjectivity—like objectivity—is an effect of *différance*, an effect inscribed in a system of *différance*...The subject, and especially the conscious and speaking subject, depends on the system of differences and the movement of *différance*."<sup>17</sup>

Language, then, is not the outward expression of a prior, inward, non-linguistic subject or thought. This is why Derrida rejects the idea of "authorial intent" underlying a text as its meaning. Meaning occurs only within the text; it cannot be isolated or detached from the text, the expression, the sign. But therefore, the text, language, or sign is not the expression of *anything* prior to itself. It is, indeed, expression, but not the expression of *anything* (else); it is sign, but does not refer to a separate signified. The differences which constitute language, according to Derrida, "are produced effects, but effects which do not have for cause a subject or a substance, a thing in general, a being somewhere present and itself escaping from the play of *différance*. If such a presence were implied...in the concept of cause in general, it would be necessary therefore to speak of effect without cause."<sup>18</sup> This recognition of any system of meaning as "effect without cause" is what Derrida tries to indicate by calling it "trace": whatever we can say or think is not pure presence but trace, referring elsewhere, but never to any referent, anything which is not itself a trace, outside the system. In the traditional view, a sign is, as Derrida says, always "second and provisional: second from an original and lost presence from which the sign has just derived; provisional with regard to this final, lacking presence in view of which the sign would be in movement of mediation."<sup>19</sup> But for Derrida, it is, we might say, a second without a first, for while, as a sign, it is always derivative and refers outside itself, there is nothing there for it to derive from and refer to. Hence he concludes that "the representation of language as 'expression' is not an accidental prejudice, it is a sort of structural

decoy, what Kant would have called a transcendental illusion."<sup>20</sup> The idea that language expresses a prior meaning is an illusion, but an illusion that inevitably and necessarily arises from the very nature of language itself. Deconstruction is the endless exposure of this illusion: necessarily endless because the illusion itself is inevitable and can never be definitively escaped.

Derrida, then, breaks down an entire series of parallel metaphysical dualisms which he sees as central to the western, Platonic tradition. "All these metaphysical oppositions (signifier/signified, sensible/intelligible, writing/spoken word...) become non-relevant. They all come back...to subordinating the movement of *différance* to the presence of a value or a meaning which would be anterior to *différance*, more originary than it...This is still the presence of...the 'transcendental signified.'"<sup>21</sup> With Derrida, the signifier is no longer the expression of a signified; the sensible is no longer the expression of the intelligible; language is no longer the expression of thought; the outward is no longer the expression of the inward. And we may complete and summarize this list by adding that the world is no longer the expression of God. Derrida's view is nicely captured by Umberto Eco's metaphor of an onion: we wish to peel the onion to arrive at the core, to penetrate through all signs to arrive at the inner core of meaning. But "the universe is peeled like an onion, and an onion is all peel."<sup>22</sup> When all the layers of peel, all signs, have been removed, nothing remains. All is outside with no inside, image with no archetype, expression with no subject. All language, all being, is like an onion, all peel and no core—an endless play of signifiers, signifying nothing.

## II

Derrida's account of the constitution of meaning by difference, and his insistence that nothing can be present outside the system of differentiated signifiers, cannot fail to strike a familiar note for anyone acquainted with Plotinus' account of the nature of intelligible being. For Plotinus, being, τὸ ὄν, that which is, is trace, sign, and image, a complex system of forms or intelligible natures, a "one-many" reflecting and expressing the One.<sup>23</sup> For Plotinus as for Derrida, all that is available for thought, is sign.

Each being (ὄν) is a form, and being as a whole is the interconnected and interpenetrating totality of these forms.<sup>24</sup> As such it is the total content of thought, at once act-of-thinking and object of thought, and thus also goes by the name of Intellect. Being and thought are not only correlated and co-extensive but identical. "We have here, then, one nature, Intellect, all realities, and truth."<sup>25</sup> But since, for Plotinus, to be is to be intelligible, being is constituted by differences. To be intelligible, an object and content of thought, is to be determinate. "Being must not fluctuate, so to speak, in the indefinite, but must be fixed by limit and stability; and stability in the intelligible world is limitation and shape, and it is by these that it receives existence."<sup>26</sup> But to be determinate is to be defined over against other beings, to be this and not that. Determination depends on, or indeed is constituted by, otherness or difference. This is one of the reasons why being, as intelligible, cannot be absolutely simple, but must be a multiplicity of distinct forms. Where there is no multiplicity, there is no otherness and therefore no determination, no intelligibility, no being. "Each of the things which are being thought brings out along with itself sameness and otherness....Therefore the thinker must apprehend one thing different from another and the object of thought in being thought must contain variety."<sup>27</sup> Hence Plotinus' forms are established precisely as Derrida describes the play of signifiers within a text. Intelligibility, and therefore being, is constituted only in and by the differences of one form from another within the system of being. Being itself is a text, an interweaving of forms constituting one another through their mutual differentiation. This is why no form can be isolated and considered apart from the others. They are related, as Plotinus says, like theorems in a body of knowledge,<sup>28</sup> so that each one both implies and is implied by the whole, and the extraction of any one would involve the destruction of itself and of the entire system. What Derrida says of all concepts applies precisely to Plotinus' forms: "Every concept is...inscribed in a chain or in a system in the interior of which it refers to the other, to other concepts, by a systematic play of differences."<sup>29</sup> Here Plotinus and Derrida are in complete agreement as to the nature of intelligibility. Only within the system of differences can anything be thought, and therefore no object of thought, no being, can be isolated outside this system and encountered as a pure presence. Intelligibility and therefore being

is constituted by the play of differences within the system of intelligible beings. Differentiation is not prior to being, since there can be no difference without beings which differ (from each other) but neither is being prior to differentiation, since there can be no being without determination and therefore difference. Plotinus' account of being and difference, then, matches Derrida's notion of *différance*. The play of differences which constitutes being takes place only within the system of being itself, and nothing can be prior to, or escape from, this intra-systemic play of signifiers.

At this point, however, an obvious objection arises. To be sure, Plotinus regards being as sign, image, and trace. But for Plotinus, is it not the sign of something, a trace of the One or the Good? Being is precisely not ultimate and supreme, but points beyond and behind itself to the One, which would be, in Derrida's terms, the transcendental signified, the meaning of the text, the core of the onion, the ultimate first principle to which being, as sign, is second and provisional, that which is not itself a sign and is prior to, exempt from, not included within the system of being or difference. Indeed, Plotinus describes being as not only the image and trace of the One, but as its *λόγος* or expression.<sup>30</sup> Is he not then guilty of metaphysics as Derrida describes it, adhering to the classical system of dualisms which Derrida deconstructs? The One is the "inside" of which being is the outward presentation. The One is the "subject" which "speaks" being as its self-expression. The One is the archetype of which being is the image. Indeed it would seem that Neoplatonism is the clearest, even the paradigmatic case, of the attempt to isolate a pure presence, a transcendental signified, prior to the play of differences. This is, indeed, precisely how Derrida distinguishes his own project from negative theology:

Negative theology [is] always concerned with disengaging, as one knows, a superessentiality beyond the finite categories of essence and existence, that is of presence, and eager always to remember that if the predicate is refused to God, this is to recognize for him a superior, inconceivable, ineffable mode of being.<sup>31</sup>

And Derrida has already deconstructed any such move. If the One is said to be "beyond being," this simply defines it over against being, and thereby re-inscribes it within the system of differences. The One is, in short, a supposed transcendental signified, and as such can easily be shown to be not truly transcendental, but

involved in and produced by the system which it supposedly founds. This, however, is a fundamental misreading of Plotinus' idea of being and the One, a misreading which is not by any means unique to Derrida, but which is made by all those, including some of Plotinus' supporters, who fail to realize the true meaning and radical implications of "beyond being." Because to be is to be intelligible, and therefore finite, determinate, and complex, whatever is is therefore derivative, dependent on the determination and unity whereby it is. No *being* can be the first principle, for to be a being, i.e. to be, is to be derivative. "For all things [together, the totality of being] are not an origin, but they came from an origin, and this is no more all things, or one of them."<sup>32</sup> Consequently the One, precisely as not derivative and dependent, neither is nor is intelligible. The central point of Plotinus' doctrine that being is not supreme, but is the product and expression of the One which transcends it, is that *anything whatsoever* is not and cannot be the ultimate ground. The unfortunate common phrase "Supreme Being" would be, for Plotinus, a sheer contradiction in terms: no *being* can be supreme. The One, therefore, as Plotinus repeatedly says, is not any thing, indeed is Nothing. No common term whatsoever can be applied to beings and to the One. As Plotinus explains, "It is not equal to the other units so as to be one of their company; otherwise, there will be something in common between it and those which are included in the count with it, and that something in common will be before the One itself."<sup>33</sup> Thus it is not the case that Plotinus, as Derrida says of negative theology, "recognizes for [God] a superior, inconceivable, ineffable mode of being." This would imply that being can be predicated, albeit in radically different "modes," of both finite beings and the One, thus situating the One, however "differently," within the totality of being, and making it subject to a term more inclusive than, and hence prior to, itself. This is precisely what Plotinus intends to avoid when he insists that nothing can be predicated of the One in any way whatsoever.<sup>34</sup> Indeed, since to be is to be intelligible, an "inconceivable, ineffable mode of being" is simply contradiction and nonsense. Hence, when Plotinus says that to attain the One we must "take away everything,"<sup>35</sup> he means no less than he says: not "everything else," but, strictly and simply, "everything." For Plotinus knows, like Derrida, that if the One is anything at all, it

will inevitably be re-inscribed within the system of differences which constitutes intelligible being.<sup>36</sup>

What then are we to make of Plotinus' innumerable descriptions of the One in terms appropriate to a transcendental signified, as *something* which is beyond being, other than and prior to being? Such statements must be interpreted in the light of the philosophical principles already articulated. First, Plotinus is well aware that the One cannot be other than being in the sense in which one being is other than another, for this would ascribe determination to the One. "It is the nature of the Good not to be all things and not to be any one of them; for [if he were] he would come under one and the same classification as all of them, and if he came under the same classification, he would differ only by his individuality and specific difference and some added attribute."<sup>37</sup> This is precisely why Plotinus says that the One "has no otherness."<sup>38</sup> If the One were other than being, it would be another being, and so would not be truly other than all things. To be truly, absolutely "other" than all things, truly transcendent, the One must be not even other. Here already we see Plotinus developing a notion of transcendence quite different from that which Derrida criticizes. The many indications of the One's "priority," too, cannot be taken at face value, for that which is prior to being would, again, be something, a being, other than other beings, which Plotinus denies for the One. Rather, we must take his references to the One's "priority" as nothing but a way of describing the secondariness of being, its derivativeness, its non-ultimacy. Plotinus indeed tells us as much when he says, "Even to say 'cause' is not to predicate something accidental of it [the One] but of us, that we have something from it, while That is in itself; but neither ought one who speaks precisely say 'that' or 'is'..."<sup>39</sup> Even "cause," and hence, of course, ontological priority, must be negated, as indicating only our secondariness, not a positive priority on the part of the One.

Plotinus' One, then, is not a transcendental signified but rather has far more in common with Derrida's *différance*. In explaining why his project bears an apparent resemblance to negative theology, Derrida says that *différance* "is not, does not exist, is not a being-present (*on*) whatsoever; and we will be led to indicate also everything *which it is not*, that is, everything; and consequently that it has neither existence nor essence. It belongs to no category of being, whether it be present or absent."<sup>40</sup> It is after this that he goes

on to distinguish his project from negative theology, in a way that we have already seen to be inaccurate. For the One is neither a word nor a concept nor a being, but rather, we might say, the making-possible of being. That which is can be intelligible, and so can be, only by being one, by being finite, determinate, unitary. And hence every being, and being as a whole, in that it is one, is a trace and sign of the One. But the One itself is not anything. Therefore, for Plotinus as for Derrida, being is a trace, but not a trace of *something*; a sign, but not a sign of some signified, some presence rising above the sign. "And thus [the One] is none of all things, but before all things. What is it, then? The power of all things."<sup>41</sup> This frequently recurring expression (*δύναμις τῶν πάντων*)<sup>42</sup> indicates the One as not any being but the possibility of all beings, not intelligible but the possibility of intelligibility, precisely as Derrida describes *différance* as not a concept but "the possibility of conceptuality." Being as intelligible is a system of differences, and the One is the production (not the producer) of these differences: not a differentiator, but the differentiation itself of being. Derrida says, "This (active) movement of the (production of) *différance* without origin, could one not have called it, simply and without neographism, differentiation? Among other confusions, such a word would have let think some organic unity, originary and homogeneous, coming eventually to divide itself, to receive difference as an event."<sup>43</sup> This is, unfortunately, precisely how Plotinus' One is often erroneously presented. But in fact, the One is not something which in any sense first is and then produces difference, an agent distinct from and prior to its productive action, but is rather Differentiating, the production of difference, itself. This is what Plotinus intends to express by his insistence that the One is not a being which acts but rather is (productive) activity.<sup>44</sup> All this is involved in saying that the One is the "power of all things," itself Nothing, not a cause which lies behind and prior to its effects.

Plotinus thus offers an understanding of transcendence quite different from that which Derrida takes to be the universal norm in the western tradition. Transcendence here does not mean priority, separability, or, to use Derrida's term, disengageability from that which it transcends. Plotinus' One is not a "superessentiality" which can be "disengaged" from intelligible being. The One, as the differentiating which occurs in being, establishes being, so to

speaking from within. There is no One without being, for the One, itself Nothing, is the production of being. There is, as Derrida insists, no meaning, no signified, apart from the system of signifiers. The One, the meaning of being as sign, is indeed transcendent, in that it is not reducible to or identifiable with being as a whole or any part of it.<sup>45</sup> But it is transcendent to being only as immanent in being. Indeed, for Neoplatonism, transcendence is not prior to immanence, as in the metaphysics which Derrida criticizes, but rather identical with it. Plotinus explains with the utmost clarity why this identity is necessary:

[The One] is there and not there; it is not there because it is not in the grasp of anything, but because it is free from everything it is not prevented from being anywhere. For if, on the other hand, it was prevented, it would be limited by something else, and...God would go just so far, and would not be independent but a slave to the beings which come after him. The things, therefore, which are in something are there where they are; but everything which is not somewhere has nowhere where it is not. For if it is not here, it is clear that another place contains it, and it is here in something else, so that the "not somewhere" is false. If therefore the "not somewhere" is true and the "somewhere" is false...it will not be absent from anything. But if it is not absent from anything and is not anywhere, it is everywhere independent.<sup>46</sup>

As transcendent, the One cannot be "somewhere," i.e. determinate, for it would then be finite, a part of the system of being. But precisely because it is "not somewhere," it is, at once and identically, nowhere and everywhere, transcendent and immanent. For if it were "not here," i.e. merely other, it would be somewhere else, a determinate being. Precisely in order to be not somewhere, not any thing, and so not derivative, it must be everywhere, all things. Transcendence which is not immanence is not true transcendence, but mere otherness. Real transcendence is universal immanence. "The One: all things and not even one,"<sup>47</sup> says Plotinus, and again, "All these things are the One and not the One."<sup>48</sup>

Another way of putting this is to say that the One cannot be, as it is often described, the center-point from which being emerges as a surrounding circle. There can be no such identifiable center-point, for any such point would be one point within the system, determined or located relative to all other points. The lack of a

center for being or thought is another common way of expressing the deconstructionist denial of the transcendental signified. Plotinus' One is not the center as one point within the system, for then it would not be truly transcendent, truly Nothing. But for Plotinus, this implies that the center is everywhere and everywhere is the center, that no one point is the center because all is center. Where anything is, there is the center; and therefore, no one thing is the center. Plotinus expresses this by asking us first to envisage being proceeding from the One as light from a point-source, and then instructing us to remove the determinate source but retain "the power of the light."

Would you still say that the light was somewhere, or would it be equally present over the whole outer sphere? You will no longer rest in your thought on the place where it was before...you see the light everywhere.<sup>49</sup>

Returning to the image of the onion, we can see clearly just where Derrida and Plotinus meet: they agree in rejecting the dualism of peel and core, the notion of peeling off all the layers of signs until we arrive at, or "disengage," a pure signified. When all the signs have been stripped off, we are left with nothing. But for Plotinus, this means that it is as true to say it is all core as that it is all peel. The center is everywhere. This is quite different from Derrida's notion that traditional western metaphysics invariably seeks the transcendental signified as an identifiable center distinct from that which surrounds it.

Plotinus' One, then, is not a "pure presence." Indeed, Plotinus' philosophy is not fundamentally a doctrine of the One (there can be no such doctrine, for nothing can be said of the One), but a study of being, of that which is; and what it discovers is that being, all that is, is not ultimate or autonomous, but is trace, sign, and image. Plotinus wishes us to see reality as sign and image, but not in a dualist manner, not as the sign and image of some separate, independent Other. It is, as Derrida describes any system of signification, an effect without a cause, a second without a first. It is not the isolation of a transcendental signified, but rather the recognition of being as sign, that Plotinus is trying to indicate by his description of being as the trace of the One. Thus he says, "[The Good] has given from itself a trace of itself to the seeing Intellect

to have; so that there is desire in Intellect, and it is always desiring and always attaining;"<sup>50</sup> not first desiring and then attaining, as it would if the One could be disengaged as a pure presence, a stopping-point for the motion of being, but "always desiring and always attaining." Being can never rest, because it is not signified but sign; but in its very motion of referring it presents what is never present, it has what it desires. It is not in stripping away the sign to disengage the signified, but in reading being as sign, that we encounter its meaning. In this way may retain the meaningfulness of the text, of being, without falling into either the pernicious dualism of signifier and signified which Derrida rightly criticizes, or the nihilist meaninglessness which the mere absence of the transcendental signified entails.

### III

The same theme emerges still more explicitly in the thought of Dionysius the Areopagite. For Dionysius, as for Plotinus, God is "beyond being,"<sup>51</sup> beyond not only all affirmative but also all negative predication,<sup>52</sup> indeed not only ineffable and unknowable but beyond ineffability and unknowing (ὑπερὰ ῥήτως, ὑπεράγνωστον).<sup>53</sup> Hence his negative theology consists not of negative statements about God, which would still leave God defined over against being, but rather of utter silence. We must "honor the hidden of the divinity beyond mind and being with unsearchable and sacred reverence of mind, and ineffable things with a wise silence,"<sup>54</sup> and union with God "comes about in the cessation of every intellectual activity,"<sup>55</sup> in complete "non-activity of all knowledge."<sup>56</sup> And this is for the same reason that we found in Plotinus. If God were anything at all or were accessible to the mind in any way at all, he would be determinate, derivative, and hence not God. "If someone, having seen God, understood what he saw, he did not see God, but something of those things of his which are and are known."<sup>57</sup>

Since, for Dionysius as for Plotinus, to be is to intelligible, or determinate, what makes a thing to be is what makes it to be itself and not any other. Consequently God is not determinate and is not anything. But at the same time, the determination or differentiation whereby each being is itself and thus is, is its creator, God-in-it.

This is why Dionysius says, "The being of all things is the divinity beyond being."<sup>58</sup> God, himself not anything, is the creative determination, the being, of all things:

In the cause of all things the paradigms of all beings pre-exist, in one embracing union beyond being...Paradigms, we say, are the being-making (οὐσιοποιούς) logoi of all beings, which pre-exist uniformly in God, which theology calls pre-determinations...determinative and creative (ἀφοριστικά καὶ ποιητικά) of beings, according to which the Beyond Being both predetermined and produced all beings.<sup>59</sup>

On this ground Dionysius even ascribes the name "Different" to God, as the differentiation which makes all things. God is called "different, because he is present providentially to all things, and becomes all things in all things for the preservation of all...Let us consider the divine difference not as some alteration of its super-unchangeable identity, but as the single multiplication of itself and the uniform processions of its fecundity to all."<sup>60</sup> Hence, as the differentiation of beings by which all things are, Dionysius' God, like Plotinus', is at once radically transcendent and totally immanent, no thing and all things, "all beings and none of beings."<sup>61</sup> Consequently God is at once absolutely unknowable and totally manifest:

God is known in all things and apart from all things; and he is known by knowledge, and by unknowing, and of him there is intellection, and reason, and science, and touching, and sense perception, and opinion, and imagination, and name, and all other things; and he is neither thought, nor spoken, nor named; and he is not any of the things that are, nor is he known in any of the things that are; and he is all things in all things and nothing in any, and he is known to all from all and to none from any.<sup>62</sup>

Since all being is theophany, the unfolding of God into the intelligible multiplicity which constitutes beings, every cognition is an experience of God; and since he is not any being whatsoever, no cognition grasps him. It is in this sense that all creatures, i.e. beings, are symbols or images of God. Thus Dionysius' vision of creation as theophany agrees with Plotinus' understanding of being as sign, but not sign of a disengageable "pure presence."

Derrida, however, does not read Dionysius in this way. In "How to Avoid Speaking," his fullest discussion of the relation of his thought to Neoplatonic negative theology, he expresses his awareness that deconstruction can be given such a Neoplatonic twist:

One would thus arrive at ■ kind of proof of God—not a proof of the *existence* of God, but a proof of God *by his effects*, or more precisely a proof of what one calls God...by effects without cause, by the *without cause*...And those who would like to consider 'deconstruction' a symptom of modern or postmodern nihilism could indeed, if they wished, recognize in it the last testimony—not to say the martyrdom—of faith in the present fin de siècle. This reading will always be possible.<sup>63</sup>

But Derrida proceeds to explain why he does not adopt this reading. He contends, first, that negative theology "seems to reserve, beyond all positive predication, beyond all negation, even beyond Being, some hyperessentiality—a being beyond Being."<sup>64</sup> That is, he thinks that even Dionysius posits, and intends to "disengage," a transcendental signified, a pure presence to be encountered in a mystical union above all signs. "My uneasiness was...directed toward the promise of that presence given to intuition or vision. The promise of such a presence often accompanies the apophatic voyage. It is doubtless the vision of a dark light, no doubt an intuition of 'more than luminous...darkness,' but still it is the immediacy of a presence."<sup>65</sup> The "ascent" to this intuition, for Dionysius, he says, "corresponds to ■ rarefaction of signs, figures, symbols."<sup>66</sup> He quotes Dionysius' characterization of symbols as "shields" which hide a "secret" from the uninitiate<sup>67</sup> to argue that Dionysius retains the notion that there is a secret, a meaning which lies hidden behind all the symbols or expressions. Hence he concludes that in "apophatic discourse," "the possible absence of a referent still beckons, if not toward the thing of which one speaks (such is God, who is nothing because he takes place, without place, beyond Being), at least toward the other (other than Being)."<sup>68</sup> For Derrida, then, Dionysius' God remains "other," and therefore "the most negative discourse, even beyond all nihilism and negative dialectics, preserves a trace of the other."<sup>69</sup> Hence it cannot escape the signifier/signified dualism, and cannot altogether avoid positing a transcendental signified.

Derrida, then, reads Dionysius in the all-too-conventional way as a kind of "mystical iconoclast,"<sup>70</sup> who calls us to strip away all created symbols and images and attain a non-symbolic vision of and union with God as a "pure signified." But all this is a misreading of Dionysius' understanding of creation as symbol. First, as we have already seen, God is not "other" in such a way as to be defined over against being and therefore encountered outside of or apart from it. For Dionysius, he is no more "not-being" than he is being. By the same token, and for the same reason, there is no final encounter with or presence of God, no "silent intuition," which overcomes, or leaves behind, or dispenses with symbols. The symbols, or beings, cannot be "rarefied" or stripped away until God as a "pure signified" is left. When all symbols are taken away, *nothing* is left. We cannot go to God behind the signs, beyond being, not because of any incapacity on our part, but because there is no there there. All things that are are finite, determinate; creatures, not God; signs, not signified. "For," Dionysius says, "it is not possible for the thearchic ray to illuminate us otherwise than anagogically cloaked in the variety of the sacred veils."<sup>71</sup> This does not promise, but on the contrary excludes, any encounter with God beyond all signs. Since, for Dionysius as for Plotinus, to be is to be determinate, all that is available to us, all that we can encounter, all that is, is not pure signified but sign and symbol. "For if all knowledges are of beings and have their limit in beings, that which is beyond being is also above all knowledge."<sup>72</sup> The "rarefaction" of signs which Derrida finds in Dionysius' account of the ascent to God is therefore not an elimination of signs in favor of a pure signified, but rather a movement into the signs, an understanding or reading of them as signs. "We must, then, contrary to the popular assumption about them, *cross over into* the sacred symbols in a way befitting the sacred, and not despise them, because they are the offspring and impressions of the divine marks, and manifest images of the ineffable and supernatural visions."<sup>73</sup> The "silent intuition" of God, the only possible encounter, is attained not by discarding being but by experiencing it as icon, as sign. God is "present" only in, though, and as the created symbols, not apart from, above, or prior to them. No such presence is possible or promised. God is accessible, is revealed, is present to us, only in the veils, the created symbols, which conceal him from us. The symbol does not, as Derrida suggests, merely conceal something other (a presence, a

secret, a transcendental signified) lying behind it; rather, it reveals what it conceals. The secret does not lie hidden behind the manifestation. The secret itself is manifest, an open secret.

Dionysius says that the symbolic characterizations of God are

sacred compositions of daring God-formation, manifest presentations (προβεβλημένα) of hidden things, and multiplications and divisions of single and indivisible things, and multiform shapings of formless and shapeless things; if anyone is able to see their hidden inner beauty, he will find them all mystical and deiform and filled with much theological light. For let us not think that the manifestations of the compositions have been formulated for themselves, but that they shield (προβεβλήσθαι) the ineffable and invisible knowledge to the many, lest the all-holy things be accessible to the profane; but they are unveiled only to the genuine lovers of divinity, who do away with all childish imagination about the sacred symbols and are able to cross over by simplicity of mind and fittingness of contemplative power to the simple and supernatural and exalted truth of the symbols.<sup>71</sup>

Derrida cites part of this passage to support his contention that Dionysius regards the symbols as "shields" which conceal the secret knowledge of God.<sup>72</sup> But this is only half the story. Dionysius here says not merely that the symbols "shield" such knowledge, but also that they are "manifest presentations" of it. And the crucial point, which Derrida surprisingly misses or ignores, is that it is one and the same Greek word which, in a manner after Derrida's own heart, means both "presentation" and "shield." (The root meaning of this word, προβάλλω, is "to throw forth, to project," so that it comes to mean both "present, put forth," and "shield, screen, set up a defense.") The symbols, then, present what they shield and shield what they present, and the presenting and the shielding are one and the same act. This expresses precisely the relation of being to God. "Before the other participations of him being is presented (προβέβληται)."<sup>73</sup> and "the beyond-goodness-itself is hymned as presenting (προβαλλομένη) the first gift, that of being itself."<sup>74</sup> "The order of all things," Dionysius says, is "προβεβλημένης, presented as a shield, from [God]," and this is why "he is known to all from all and to none from any." Being itself is the presentation which shields and the shield which presents, the veil that reveals and the revelation which veils. Here again transcendence cannot be distinguished from

immanence. The divine silence does not lie behind the words, symbols, beings which express it; the silence is in, or indeed is, the words. The divine darkness does not lie behind or inside the intelligible light, but rather "the divine darkness is the inaccessible light in which God is said to dwell."<sup>75</sup> Thus Dionysius says that the angels, and by implication all things, "reveal in themselves the hidden goodness and are 'angels' because they proclaim the divine silence and, as it were, present (προβεβλημένως) clear lights which interpret that which is in secret."<sup>76</sup> The silence is the words, the darkness is the light, for all words, lights, beings, are symbols proclaiming the divine silence. Thus the relation of symbol to symbolized, of creature to God, does not fall into the dualistic framework of signification which Derrida claims for it.

#### IV

The Neoplatonic vision of all that can be present to thought, of all that is, as sign, thus escapes Derrida's deconstruction of the "transcendental signified" and his blanket characterization of the western tradition as "metaphysics of presence." But deconstructionism has performed a much needed, although purely negative service, in destroying, we may hope once and for all, the false notion of transcendence which has prevailed in the west since at least the late Middle Ages. Postmodernity at least represents our awakening from the dream of a first principle, a God, who is included within the totality of that which is and hence can be disengaged and thought apart from all signs, images, or symbols. Thus deconstruction eliminates any possible dualism between world and God, peel and core, signifier and signified. But this is precisely the lesson of Neoplatonism, with its radical insistence on God as "beyond being," its refusal to locate God at all within the realm of being, intelligibility, presence. In its doctrine of being as icon, as trace, sign, and symbol, Neoplatonism offers us "the rethinking of the idea of transcendence"<sup>77</sup> which our own time so urgently requires: transcendence without dualism, transcendence as immanence.

Like so many of the radical implications of Neoplatonism, this idea is most clearly expressed by Eriugena:

Everything which is understood or sensed is nothing other than the appearance of the non-apparent, the manifestation of the hidden, the affirmation of the negated, the comprehension of the incomprehensible, the expression of the ineffable, the access to the inaccessible, the understanding of the unintelligible, the body of the bodiless, the essence of the superessential, the form of the formless. ...the visibility of the invisible...the definition of the infinite..."

And the hidden, the incomprehensible, is not, of course, *something else* apart from the manifestation, for then it would not be hidden or incomprehensible and the manifestation would not be all that is. Hence Eriugena calls God Nothing, and expresses the relation between God and the world thus:

We ought not to understand God and the creature as two things distinct from one another, but as one and the same. For the creature is subsisting in God; and God, manifesting himself, in a marvelous and ineffable manner is created in the creature, the invisible making himself visible and the incomprehensible comprehensible and the hidden revealed...and the simple composite...and the infinite finite and the uncircumscribed circumscribed...and creating all things he is created in all things and making all things is made in all things...and...he...becomes all things in all things. And I am...here speaking...of the ineffable descent of the Supreme Goodness. ...into the things that are so as to make them be, indeed, so as itself to be."

The world is God's self-creation, his emergence into being and intelligibility. Just as meaning occurs within the text which it produces, so transcendence is found within the world which it establishes. "Except for the point, the still point, there would be no dance, and there is only the dance."<sup>1</sup> The still point makes the dance possible, but "there is only the dance:" not both the still point and the dance. When we speak, in traditional terms, of the world as a book which expresses God, we must conceive this relation not as that of a text to its author but as that of a text to its meaning. The meaning grounds the text, but occurs only in the text. Thus we are left, not with God-and-the-world, but with, only, the theophanic world. All is sign and nothing but sign. But for this very reason, the world is not meaningless but infinitely meaningful.

Understood in this way, Neoplatonism has the greatest significance for our current intellectual and cultural predicament. The modern world-view, having taken its origins in the later Middle

Ages, has now collapsed into postmodernity (including deconstruction), which is not opposed to modernity but is rather in continuity with it, its inevitable fulfilment and self-destruction. Modernity may be said to begin with the loss of the Neoplatonic doctrine of God as beyond being, the inclusion of God within the totality of that which is.<sup>2</sup> This leads to the ontotheological dualism in which God is one thing and the world is another. God is now merely another being, outside of and apart from creation, and so neither truly transcendent nor truly immanent. Hence we lose the vision of the world as sign, which expresses the unity of transcendence and immanence. The world can now be viewed as autonomous, rather than as nothing but sign, and the basis has been laid for modern science and modern secularism. Deconstruction at least does away with this modern illusion, exposing the bankruptcy of any claim to arrive at an ultimate account of reality which is not mythic, metaphorical, and symbolic, and thus showing how the modern rejection of myth and symbol, the loss of authentic transcendence, inevitably collapses into nihilism. But by bringing modernity to this conclusion, postmodernism reveals the necessity of mysticism and sacramentalism as the only way of preserving reason and meaning. The postmodern deconstruction of modernity, although purely negative and destructive in itself, may thus open the way, for the first time in many centuries, for a return to Neoplatonism's sacramental mysticism and mystical sacramentalism, to the vision of the world as the sign and icon in which we encounter the divine Nothing. "So the darkness shall be the light, and the stillness the dancing."<sup>3</sup>

#### NOTES

1. Attested, for instance, by the recent book *Derrida and Negative Theology*, ed. Harold Coward and Toby Foshay (New York, 1992). But the essays in this book tend to consider negative theology simply as a linguistic phenomenon, a way of speaking (or not speaking) about God, rather than as a way of viewing the world, an account of the nature of reality.
2. Jacques Derrida, *Of Grammatology*, tr. G. Chakravorty (Baltimore, 1976), pp. 13-14.

3. No doubt this is motivated in part by his wish to include Neoplatonism in his characterization of the entire western tradition as "metaphysics of presence."
4. Jacques Derrida, "La différence," in *Marges de la Philosophie* (Paris, 1972), p. 6; cf. "How To Avoid Speaking: Denials," tr. Ken Frieden, in *Languages of the Unsayable: The Play of Negativity in Literature and Literary Theory*, ed. Sanford Budick and Wolfgang Iser (New York, 1989), pp. 7-11, 20-24.
5. Jean-Luc Marion, in *L'idole et la distance* (Paris, 1977), p. 318 n. 39, quoting this passage from *La différence*, rightly remarks, "We have seen that, precisely, the theology called negative, in its depth, does not aim at re-establishing a 'super-essentiality' since it aims neither at predication or at Being." The relevant part of Derrida's reply ("How To Avoid Speaking," pp. 63-64, n. 2) is that "it is necessary to elaborate an interpretive discourse as interesting and original as that of Marion...to distinguish the 'depths' (the thinking of the gift, of paternity, of distance, of celebration, etc.) from what in the so-called 'negative theology' still seems to be very concerned with hyperessentiality." This merely reveals Derrida's inadequate understanding of negative theology (see below, pp. 132ff.). In fact, all that Marion finds in Dionysius is actually there, and Marion's "interpretive discourse" represents simply a sound understanding of what Dionysius, and by extension Neoplatonic negative theology in general, is trying to achieve.

24. This description of Being, Intellect, or the "world of Forms," covers the whole of reality for Plotinus. The sensible cosmos is not another world, a set of beings additional to the Forms (see e.g. VI.2.1). The intelligible, or Being, as Plotinus repeatedly insists, is all things, all that is, and the sensible is simply the manifestation in greater multiplicity (and hence less reality) of what is already contained in greater unity in the intelligible. (See my "Hierarchy and Participation in Dionysius the Areopagite and Greek Neoplatonism," *American Catholic Philosophical Quarterly* 68 (1994), pp. 24-27.) Thus there is no fundamental opposition between the sensible and the intelligible; the sensible is the intelligible, only less so, so that Plotinus can say that sensibles, and even matter, are forms, albeit lesser ones: "All this universe is held fast by forms from beginning to end: matter first of all by the forms of the elements, and then other forms upon these, and then again others...Then matter, too, is a sort of ultimate form; so this universe is all form, and all the things in it are forms; for its archetype is form" (V.8.7). Correspondingly, sense-perception, as a way of apprehending form or being, is not opposed to intellection, but is simply a lesser mode of it: "Sense-perceptions are dim intellections, and...intellections are clear sense-perceptions" (VI.7.12). Contrary to a common misreading, therefore, the fundamental distinction for Plotinus is not between the sensible and the intelligible (the latter then being subdivided into One, Intellect, and Soul), but rather between the intelligible, or being (including soul and the sensible as lesser modes of intelligibility and being) and the One. And this distinction, as we shall see, cannot imply any sort of dualism, for the One is not anything.

32. III.8.9; cf. V.5.6: "Since the substance which is generated [from the One] is form...the One must be without form. But if it is without form it is not a substance; for a substance must be some one particular thing, something, that is, defined and limited; but it is impossible to apprehend the One as a particular thing: for then it would not be the principle, but only that particular thing which you said it was. But if all things are in that which is generated [from the One], which of the things in it are you going to say that the One is? Since it is none of them, it can only be said to be beyond them. But these things are

beings, and being: so it is 'beyond being'."

35. V.3.17.
36. John Rist, in his otherwise admirable Plotinus: *The Road to Reality* (Cambridge, 1967), has argued that when Plotinus says that the One is "beyond being," he means that it is "infinite being;" that it is not the case that the One is Nothing; and that there must therefore be an analogy of being between finite beings and the One. Apart from its textual difficulties (the description of the One as Nothing is not, as Rist implies, Eriugena's innovation, but occurs frequently in Plotinus), this interpretation misses the fundamental point that since to be is to be intelligible, all that is must necessarily be finite, so that "infinite being" is a self-contradiction. This is not, as Rist argues, merely a limitation of Plotinus' lexicon, in which terms such as οὐσία and ὄν comport finitude, but a strictly philosophical conclusion. To argue as Rist does is to play into Derrida's hands by attributing to the One "a superior, inconceivable, ineffable mode of being," and thus including the One within the totality of that which is.

51. Fran O'Rourke, *Pseudo-Dionysius and the Metaphysics of Aquinas* (Leiden, 1992), p. 203, argues that Dionysius, and indeed the entire Plotinian tradition, cannot ascribe being to God because "Dionysius did not have a fully developed appreciation of the absolute and transcendental nature of Being. Greek philosophy as a whole had not yet discovered the transcendent or universal and analogical value of Being, i.e. that as a concept unrestricted in itself, 'being' adequately [!] expresses the reality both of creatures and of God [emphasis added] while yet allowing their radical distinction. It failed, therefore, to harmonise faithfully within a unified order both the finite and

infinite character of reality." O'Rourke thus claims to find a "concept" more inclusive than God; hence his idea that the finite and the infinite together make up a single "unified order," or "reality." He, and the line of thought he represents, is therefore open both to Plotinus' objection (see above, pp. 129-130, and nn. 32 and 36) that this subordinates God to that concept ("being") and thus includes God within a larger whole ("reality") and turns him into one being among others, and to Derrida's parallel contention that such a God still in some way *is* and so does not escape from the play of *différance*. The radical claim of Neoplatonism (which is not a mere inadequacy of Greek thought) is that *any* inclusion of God under a common concept with creatures is a violation of transcendence. *Reality itself* is secondary and derivative, and so cannot include God. The One, says Plotinus, "is the power of all things, and its product is already *all things*. But if this product is all things, that Principle is beyond all things: therefore 'beyond being'; and if the product is all things but the One is before all things and not on an equality with all things, in this way too it must be 'beyond being'" (V.4.2).

70. The phrase is borrowed from Hans Urs von Balthasar, "Denys," in *The Glory of the Lord: A Theological Aesthetics*, vol. II: Studies in Theological Style: Clerical Styles, tr. A. Louth et al. (San Francisco and New York, 1984), who rightly rejects it: "By no means is Denys just the advocate and architect of negative theology, the mystical iconoclast, as he is generally thought to be...Denys contemplates the divine symbols in creation and the Church with an aesthetic delight. Things are not simply the occasion for his seeing God; rather he sees God in things. Colours, shapes, essences and properties are for him immediate theophanies" (p. 179). And this, as Balthasar realizes, is merely the other side of negative theology: "The same knowledge of God demands both a deeper penetration *into* the image and also a more sublime transcendence *beyond* it, and the two are not separated one from another but are the more fully integrated, the more perfectly they are achieved" (p. 169).

Jean-Luc Marion, "La vanité d'être et le nom de Dieu," in *Analogie et dialectique* (Geneva, 1982), p. 20: "The distinctive feature of modernity, understood as the perfect completion of metaphysics, does not at all consist in a negation of God...Modernity is characterized in the first place by the annulling of God as a question. Why does God no longer abide questioning? Because the response to the question of his essence or of his existence (according to the strict metaphysical acceptation of these terms) becomes indifferent...What then is found put into play in a negation or an affirmation of God? Not God as such, but the compatibility or incompatibility of an idol called 'God' with the totality of the conceptual system where the being in its being (l'étant dans son être) marks the age...Theism or atheism aim equally at an idol. They remain enemies, but enemy brothers in a common and unsurpassable idolatry." In other words, once God is reduced to the level of being, it does not much matter whether we believe that such a God exists or not, for in either case we are failing to envisage true

- transcendence and such a "God" is not God at all but an idol. Marion's thought, as articulated for instance in *Dieu sans l'être* and *L'idole et la distance*, is a highly important example of "contemporary Neoplatonism," the deployment of a profoundly Neoplatonic vision in contemporary language and with regard to contemporary concerns.

# Can Neoplatonism be Harmonized with Postmodernity?

John R. A. Mayer

Postmodernity may be characterized as a philosophical attitude which has abandoned the notion that truth is capable of being articulated in a coherent and rational system of propositions. Rather, assertions are imaginative locutions which evoke responses from readers/listeners. These evocations are echoes of erased traces of not-yet articulated meanings. In some sense Plato's doctrine of *anamnesis* has some kinship with this view, even though Plato was convinced that there is a singular absolute truth which each human has had access to in some pre-incarnate condition of his soul. Postmoderns do not usually accept either the doctrine of an eternal soul, or its cognitive exposure to a transcendent realm of ideas prior to earthly birth. But they do recognize the famous Platonic paradox about learning: namely that one could not seek to find what one does not know, for in that case one would have no criterion in terms of which to accept or recognize what one has sought, or reject what does not constitute the object of one's search. Thus, there must be some double sense of knowing—a pre-accessible or pre-explicit knowledge, in terms of which one accepts some new, previously unthought claim, while one rejects or remains aloof from other such claims. Then there is the more conventional sense of overt, formulable knowledge.

What constitutes plausibility, what constitutes evidence or argument, are all based on the pre-explicit knowledge. This pre-explicit knowledge is neither formulated nor formulable. But it does function in every individual. Unlike Plato, most postmoderns are convinced that this inchoate cognition is not universally identical in all humans, but is partially determined by one's cultural and linguistic experience. It may further be differentiated in individuals with different character, different levels of spirituality, different degrees of access to the inward structures of consciousness. Of

course all of the foregoing is laden with metaphysical and anthropological assumptions, which the post-modern may reject, or at least, question; leaving the field open to alternative characterizations of postmodernity.

Another characteristic of postmodernity is its transvaluation of reason as the principal feature of the human and of reality. For humans the most important faculty is imagination rather than reason. The real is not deemed the rational, as Hegel claimed, rather it is characterizable by it being a judicious admixture of the rational with the novel, the unexpected, the surprising. It is not that these cannot be rationally accounted for once they have taken place: reason is flexible and inventive enough to allow for anything, and account for it in some way. In fact, reason can allow for that which doesn't happen, or will not happen just as well as it can account for what in fact took place or will occur. Thus the predictive characteristic of the rational faculty is what is questioned, and reality is seen to operate on principles additional to rationality, if they can be deemed to operate on principles at all. Perhaps reality just happens: admittedly within the constraints of what has already happened, and what has not. Imagination takes pride of place over reason, and the ability to speak poetically, originally, evocatively is of greater import than restricting articulation to the objective, the quantitative, the repeatable and the empirically demonstrable. Postmodernity is unashamedly pluralistic, reveling in diversity and difference, celebrating the primacy of the particular over the universal. It is also critical of the modern tendency to overvalue the technical and the technological for purposes of problem-solving, and the tendency to encounter the problematic with a will to solve it, rather than to respect it as such.

How can then one speak of Neoplatonism in a postmodern vein? Let us first characterize Neoplatonism briefly. Neoplatonism is a metaphysical teaching about the ultimacy and primacy of the One, which is the source, the origin of everything else, and towards which everything strives. Plotinus, claims that from the One there are a series of emanations: the first of these is *Nous*, or mind, then *Psyche*, or soul, from which *Physis* or the natural world emanates. And just as the One is the origin of this series of emanations, so the One is their ultimate goal or objective: to be achieved in reverse order to the original emanation. The path back to the One is arduous: reason might show the way back all the way to *Nous*; but

from *Nous* to the One the only path is Love, *Eros*. This doctrine, then, claims the ultimate and fundamental oneness of being, the belonging together of all the diverse differences and differentiations which we can make based on experience and rational analysis: contrast is a relative and derivative concept.

This type of doctrine has had an interesting cross-cultural history. Perhaps differing in detail and in the technical terms of description, but fundamentally the Vedanta philosophy of India, the views of Christian mystics, the cosmology of Spinoza, and some Mahayana Buddhist doctrines bear great resemblance to Neoplatonism. Not only has the teaching won converts where it was taught and read; it was reinvented, so to say, independently of the texts which belong to the tradition. In the cultural history of the West Neoplatonism has been a minor strain, nevertheless, because Christianity, based on the Jewish view of Creation came to understand the world to be radically different from its Creator; and objected to Neoplatonic teachings as tending to Pantheism, which it deemed heretical. Exactly because of this it is interesting to note that Neoplatonism continued its appeal throughout the Christian centuries, producing resurgent schools of Neoplatonism throughout the centuries.

But since Neoplatonism is a particular metaphysical claim about the ultimate unity of being, and postmodernism is the rejection of the final adequacy of any metaphysical claim, Neoplatonism included, how can the two positions be brought into harmony?

While the postmodernist does not accept the truth status of a metaphysical truth claim, he does recognize that assertions, claims have a function. The function of Neoplatonic claims is to invite attention to several aspects of reality, which may otherwise escape notice, or be simply overlooked in the immediate obviousness of the claims of pluralism, relativism and naturalism. It is the case that certain positions which in the past have been contending as metaphysical truth claims have a certain immediate obviousness of the claims of pluralism, relativism and naturalism. These have been both simply assumed or explicitly asserted as metaphysical truth-claims in the past, because they have a certain immediate appeal, a self-evidencing quality both for ordinary contemporaries and also for others in different temporal and cultural frameworks. The postmodern philosopher, however, is committed to denying the finality and truth of these positions as well. These are naturalism

and relativism. The former judges reality to be nothing other than the multiplicity of particulars accessible to the senses; the latter asserts that one's culture, disposition, character and experience contribute to what one deems real and/or of value, and as these factors are diverse in different individuals and situations, it is impossible to determine in a singular way what constitutes reality, and what are objective, absolute values. Thus, the naturalist does not consider transcendence a metaphysical possibility. He sees the heterogeneity of the natural world, and tends to think that the whole is "shoes and ships and sealing wax, and cabbages and kings." Such homogenizing principles as "substance" or "matter" are merely human notions applied to the manifold of reality to be large grouping concepts—analogous to smaller grouping concepts such as "dog" or "tree," which terms select a subset of particulars from the multiplicity of all of them, and these "class" names then apply to any one within the selected subset. "Matter" is similar, the only difference is that it applies to a much larger, perhaps nearly all-inclusive subset. What might not be included in that subset are largely the linguistic structures consequent to the formulation of a metalanguage to talk about talk; such a metalanguage contains names of elements or entities which are not objects in the natural world, but are elements of the language used in the natural world. Thus "language" would be a noun referring to something "real," which, however, is not subsumed in the subset of reality designated by "matter." That here we are skirting at the edge of a paradox cannot be explored in the present paper.

The Neoplatonic position, which, of course, intends to reject or refute such naturalism, does not usually offer arguments for its support that would convince the naturalists. It simply makes counter-assertions. What we are arguing for in the present paper is that this contrariety with the naturalist should not be interpreted as making incompatible and contending truth-claims, even if that is exactly how traditionally the issue has been understood. We would rather explore how the naturalists' views and assertions may be integrated with those of the Neoplatonist. If Naturalism is not the whole truth, it may nonetheless be significant and functional. But let us now pose some questions which Neoplatonism makes possible. How does the naturalist know that the natural, the domain of *physis*, is the whole truth? Could it not be that there is a transcendent unity on which the natural manifold depends,

inasmuch as it gets its *quiddity*, its whatness, from consciousness? Without a *psyche* would a tree be a tree, or a dog, a dog? Is not being a tree or a dog a relational notion, since the particular is only a particular, and it requires a consciousness to create the class concept of tree or dog in terms of which this particular is a tree, and that one, a dog? So, to be a tree or a dog requires not only the particulars which are so classified or recognized, but a consciousness which creates the classificatory schema, and applies it, positively or negatively, to particulars, so that this one is the tree and not that; that one is the dog, and not this. So a Neoplatonist invites the naturalist to consider the logical priority of *psyche* to *physis*.

Similarly, one can show that there is some kind of a rational structure presupposed in consciousness; the capacity of consciousness to make inferences and generalizations, to make comparisons and contrasts is essential for consciousness to be consciousness; for without such powers one could neither recognize nor differentiate, thus not be aware, since recognition and differentiation are fundamental to consciousness. These processes in turn are but aspects of order and reason, the structure that Plotinus deems *nous*, mind. And while a similar argument is not possible for the establishment of the priority of the One to the *nous*, Plotinus suggests that some kind of love, desire, longing points beyond reason, to the unity of being. It is this pointing which gave birth to monistic metaphysics. Its function is not the mere assertion of plain truth; no. Its function is to evoke from us a deep-seated memory, a resonance with the call to see the wholeness, the interdependence of things; the structure that lies behind and above the "shoes and ships and sealing wax" that the naturalist not incorrectly insists on. What is perhaps wrong with the naturalist's position is not what he asserts and emphasizes positively, but what he negates, denies or ignores. The metaphysics of transcendence draws attention to these aspects; but perhaps overstates its claims by making pejorative and disvaluational claims about exactly that which is dear to the naturalist's sense of reality. It is this deemed emphasis in disvaluing the "derivative," the temporal, the merely situational and transitory that weakens the Neoplatonic position.

Of course it is not incorrect to say that in some circumstances, as the attitude of one particular mode of consciousness, in one specific and important way of being, the relative importance of the

particular fades, as one contemplates the whole, which embraces and integrates all difference, all contrast, all otherness. Such a way of being, such a disposition of mind is useful for vivial purposes, especially when one is dissatisfied with the specificity of the specific, the contrast with what is, with what might have been, or what ought to be. In other words, the aesthetic, the feeling component of the mode of being that is the source of Neoplatonic metaphysics is a powerful antidote to the ressentiment, the suffering, the dissatisfaction that may arise when one is immersed in the condition in which naturalism and relativism are the persuasive metaphysical claims. Neoplatonism, then, the postmodern may argue, is not primarily a metaphysical dogma, but a call to a new way of being personally disposed; a way, which the Neoplatonist believes—not without some evidence—is available to human consciousness; a way that enhances and enriches rather than reduces or eliminates the ordinary naturalist way of being. Yes, perhaps it imbeds that way in its own; but it opens a way for human orientation which may not be the one and only final truth; but which has a truth to it; and, more importantly, it has a function in developing the dispositional possibilities of human intelligence, human passion and human awareness. Such a development may have an intellectual component, but it certainly also has an existential aspect which enriches and empowers the individual to deal with pain, sorrow, and suffering more effectively both in the first-personal sense, and in the role of one who is compassionate and consoling when the suffering and sorrow touches the lives of others.

As a postmodern, it is not the truth of Neoplatonism that makes for its significance, but rather, its empowering aspect, its capacity to transform. Paradoxically, for in the end all is paradox, it is this empowering that most seriously attests to the truth of Neoplatonism, which we rejected out of hand as the postmodern predilection. Perhaps, if truth and falsity be both recognized as species of half-truths; the former, the half-truth deemed useful in a context; the latter, the half-truth which, though persuasive, is dysfunctional, we can come to appreciate the value of Neoplatonism in a postmodern world, with a postmodern stance. It is an important empowering supplement to the naive and easy naturalism and relativism—which need not be rejected, only transcended, *aufgehoben*, as Hegel would have suggested, into that

postmodern synthesis which asserts both the thesis and the antithesis—in this case naturalism and Neoplatonism—and shows the limitations of each at the same time.

Thus we hope to have shown that postmodernity may be the Hegelian synthesis of naturalism and relativism as one pole—the thesis—Neoplatonism, as its higher opposite, the antithesis. When the focus of our concern is not metaphysical truth but the extension of human existence and human consciousness, the synthesis becomes clearly achievable.

Brock University

# Alexej Losev: A Neoplatonic View of the Dialectic of Absence and Presence in the Nature of Artistic Form<sup>a</sup>

Oleg Bychkov

Recently the traditional views on the nature of thinkable and intelligent reality have been severely challenged. One of the radical expressions of this alternative view is contained in Derrida's "Of grammatology". His task, to put it in his own words, is to undermine an "ontology which...has determined the meaning of being as presence and the meaning of language as the full continuity of speech...to make enigmatic what one thinks one

---

<sup>a</sup>Alexej Fyodorowitch Losev (1893–1988) was the last survivor of the pre-revolutionary generation of great Russian philosophers. Having stayed in the communist Russia, his original philosophical career ended in 1930 with an arrest and an almost two-year stay in Stalin concentration camps. He never again returned to original philosophical writings which now include, above all, five monographs published prior to 1930 (as yet none of them translated into English). After his release, the scholar continued teaching ancient languages and resumed publishing on various subjects pertaining to ancient culture in the 1960's. His most comprehensive work is an eight volume "History of Ancient Aesthetics". Although heavily influenced by Husserl's phenomenology, Losev described his own philosophical method as "dialectical logic" inspired in part by German classical philosophy (Fichte and Schelling in particular). However, as is evident already from his early writings (and especially his first monograph "Ancient Cosmos and Modern Science"), Losev was much more indebted to Neoplatonic thinkers, and especially Plotinus and Proclus. From them he not only drew inspiration but often assimilated methods and ideas, re-working and transforming them in his own philosophical writings. All this allows us to consider him the last significant Russian thinker of an original Neoplatonic orientation.

understands by the words 'proximity', 'immediacy', 'presence'.<sup>11</sup> The structure which must replace the ontology of presence is the trace, when the actual "meaning" or "essence" is always absent, already "not there" by the time of one's intellectual experience. The ontology of presence, however, efficiently survives finding its confirmation in mystical experience. The view attacked by Derrida, in its contemporary form, can be illustrated by the writings of Georg Kuehlewind, a disciple of Rudolf Steiner. According to him, all intelligent reality for a typical present-day human consciousness is divided into the planes of the past and the present. "...The essential or eternal present is the source from which the linked duality of time and space...emerges at the moment when the source is mirrored and no longer experienced as such. After the timeless conception of the meaning of a sentence, the source itself retreats into the superconscious sphere. The fragments of it which appear at the level of the past we call time and space."<sup>12</sup> The essential presence "also lights up in thought intuition and understanding...When we understand something through thinking, our soul briefly touches the superconscious plane of the present and then remains on the plane of the past..."<sup>13</sup> Kuehlewind's account thus includes the notion of the trace as the essence of our common, unenlightened experience. However, the difference with Derrida lies in the fact that, for Kuehlewind, the "essential present" does not have to remain concealed forever, but is in its nature conceptual and entirely thinkable: the experience that can be gained in the course of long intellectual practice. Having reached the final goal, "pure perception," "we are no longer blinded, and the incomprehensible regains its rank as a high idea. Our perception dissolves into understanding, into spiritual presence in the here and now."<sup>14</sup>

The two positions have just been outlined very schematically. It is obvious that continuous efforts have been made to bring both positions into alignment with each other. One of the most daring attempts to bring together in a kind of a dialectic, on the one hand presence or disclosure and on the other hand absence or concealment, was made by Heidegger with reference to the nature of art. His early work "The Origin of the Work of Art" appeared almost at the same time as Losev's "Dialectic of Artistic Form", and both works, while remaining radically distinct, have a surprising number of similar images and ideas evoked by two

independent phenomenological reflections. The essence of the work of art, according to Heidegger, lies in the opening up of a "world" and holding it open. The "Open of the world" is a metaphor for presencing, deconcealing, disclosure, or truth in the Greek sense of *aletheia*. "Some particular entity ...comes in the work to stand in the light of its being." The principle that the work of art "moves...into the Open of a world" and "causes to come forth" Heidegger calls the "earth" (46). However, the earth even in the process of its presencing ever remains concealed or somehow "absent." The earth "shows itself only when it remains undisclosed and unexplained. Earth thus shatters every attempt to penetrate into it....The earth appears openly cleared as itself only when it is perceived and preserved as that which is by nature undisclosable, that which shrinks from every disclosure and constantly keeps itself closed up" (47). The two principles then, the opening up and disclosing by means of a world, on the one hand, and concealedness and impenetrableness of the earth, on the other, operate together and form the unity and self-subsistence of the work of art. Heidegger writes,

A being can be concealed...only within the sphere of what is lighted. Each being we encounter and which encounters us keeps to this curious opposition of presence in that it always withholds itself at the same time in a concealedness. The clearing in which beings stand is in itself at the same time concealment (53).

Although the main element in the essence of the work of art remains its presencing and opening ability, concealment is dialectically necessary. If there is no concealment there is no openness, something can never be revealed. However, Heidegger, having presented the dialectic of the two necessary elements that are inseparably connected with each other, never goes beyond the simple meditative circle of "openness/closed-ness." The relationship between them remains unexplored.

Let us turn now to Losev's work "The Dialectic of Artistic form". First of all, I would like to recall the prominent place logic held among many Neoplatonists, especially such thinkers as Proclus who had influenced Losev greatly, contrary to a commonly held opinion of Neoplatonism as a kind of "mysticism." This logical inspection of the inner intelligent reality almost makes Neoplatonism into an ancient form of phenomenology—the very

method that Losev chose as his research tool. It must be remembered therefore that Losev is not concerned with common definitions or explanations, but with pure phenomenology: the thinkableness and the conditions and presuppositions for the thinkableness of artistic form. It is also important that Losev, following the traditions of German idealism, uses what he calls a dialectical method in logic which means that all later categories are dialectically derived from the earlier and that the earlier categories are dialectically contained in the later, just as all inner levels are contained in the outer.

Losev starts to derive his categories from the most abstract level by exploring the conditions of thinkableness as such. He does it by constructing the abstract Tetractyde, the elementary "brick" of intelligibility. The first category is the One.

The beginning of dialectic is unthinkable-ness, supra-thinkableness, absolute one-ness which is neither this nor that, not any particular thing at all but the potentiality of all things and categories (10).<sup>6</sup>

Thought first demands unthinkable-ness, but then requires the "positing" or setting-in-place of this one, in other words, its "being." Thus we produce the "being-one," the one that is one, that exists.

It means that it differs from the other, is circumscribed within its limits, becomes something, is defined, becomes meaningful and shaped. From now on, it is not just the indivisible one but also the divided many, for it has assumed a border. It has received a contour and therefore became meaningful. It has become something definite and therefore being. It is such one-ness that is given as divisible plurality (10).

This will be the second element of the Tetractyde, its abstract meaning which Losev calls *Eidos*.

At this point the question concerning the nature of intelligent reality, that is whether it is essentially presence or difference and the trace, can be resolved by means of pure phenomenological reflection. Thought demands that, in order for something to be thought, there must be two things, the thought must differ from what is not thought. Therefore an experience of "essential presence" is possible, but at this level there can be no reflection or thought. The level of conceptual thinking, however, demands

duality, or the ever escaping structure of the trace and difference. This has been known at least since the time of Plotinus (cf., e.g., *Enn.* 5.4.2 and 8.11). It would be absolutely wrong, however, to credit a Neoplatonic position merely with this elementary observation. The real value of the Neoplatonic approach, and in particular that of Losev, is in the developing of the dialectic of the many levels and layers of gradual presencing and appearing between the unthinkable One and clear thinkableness, between the concealedness and unconcealedness. And it is to this multi-level dialectic that I now return.

The second element of the Tetractyde was *Eidos*. *Eidos*, however, is the same as the One, only insofar as the One differs from something other, which was demanded at stage two, the One looked at from the point of view of this other. This other is just an aspect of the One, the other of the one, or the becoming-other of the one. This third category Losev calls Becoming. It is the allogical becoming of ■ logically divisible unity. In its dialectical development, Becoming must resolve into yet another category. This will be the "become" (*das Gewordene*), that which is at hand, the fact which carries on itself the becoming and the whole of the meaning of the triad. Here, according to Losev, is the end of the necessary dialectical definition of the thinkable (and being) as such. The Tetractyde thus derived is closed and completely self-sufficient. Yet, the levels of the fact and becoming include—purely logically at this point—a possibility of the extension of *Eidos* into a different kind of other, into a surrounding environment, a becoming as being perceived by something else: the quality that Losev calls expression.

Expression, however, does not mean proceeding to the next category from the Tetractyde. Rather, it means moving to another level "in depth," and not "in extension"; to the level when the other, instead of being one of the aspects of the One, starts to include also its perception from the outside and its reflection in that which is outside. The Tetractyde can be thought of

as if coated with its other. It would mean to view this...dialectical category as a potentiality...and the principle of various incarnations of this category in the further other. It would mean to pass from the fact, that carries within it the triadic meaning, to its expression, or form. The expression of the fact is the fact differentiated from the surrounding other. Expression is not meaning, for meaning (our second

principle) presupposes the other only inside itself: it is the self-divisibility that is viewed itself in itself. Expression, or form, is the meaning which presupposes the other outside itself, co-related with the other which surrounds it; it is the self-divisibility that is viewed from the point of view of the other (12).

The next stage after the abstract Tetractyde is the self-conscious Tetractyde, the Tetractyde at the intelligent and living level, or the Tetractyde as intelligence. The first principle then becomes the identity of the knower and the known, or of being and being-other which Losev calls ecstasis. Eidos at the intelligent level is cognition: the "positing, affirming oneself as defined through the being-other" (19), the intelligence looking at itself from the inside. The principle of becoming or developing, since the other at this stage is still immanent to *Eidos* itself will be striving or will. The fourth element—the fact—will become the living body with its organs, and the "extending," or "projecting" aspect of the latter is emotion, or feeling. This level of the living and intelligent Tetractyde is not directly relevant to Losev's investigation of the nature of artistic form, but it is included in the subsequent layers.

The key to Losev's theory of artistic form is the functioning of expression at the intelligent level. Taken in its expressive aspect, the intelligent and living Tetractyde goes outside itself into a thinking and perceiving environment. It must be mentioned now that for Losev's phenomenology the subject/object distinction in this case is not essential. Here the Tetractyde exists as a self-intellecting entity at the level above self-contained individual life, or an individual object, or a particular consciousness. On the contrary, it includes, with equal validity, all phenomena and objects of consciousness, both "mythical" and "real," absolutely all that, under certain circumstances, can become intelligent, either as a subject or as an object. Rather, expressiveness at this level and its particular case—artistic form—is some supra-subjective and supra-material entity that governs all the rest, being akin to the principles of existence in general. In art, as opposed to technology, we create or perceive life, in the sense that it is something that we cannot completely control or understand, like natural living organisms. Therefore artistic form cannot be sustained within the limits of individual consciousness. On the other hand, artistic expressiveness needs consciousness and intelligent levels for its

existence. Such expressiveness thus exists in-between different layers of reality and is connected to all of them.

At this expressive level when the Tetractyde opens up, gains access to the outer world and is perceived, while still remaining in itself, reflective and alive, three other categories are introduced. The abstractly given meaning, or *Eidos*, "given in its intelligent fullness," in its "intelligent expressive-ness" is called the Myth. The Myth is understood by Losev as an ontological category of the intelligent level. It is any meaningful entity that enters consciousness and is able to exist and sustain itself in it independently, to have its own life. It differs from abstract meaning in that the Myth is meaning taken together with its self-conscious and reciprocal relation with the outside, or the other, with its intelligent and perceiving environment, and therefore with a particular content and a particular way of understanding this content. It is most important to analyze the nature of the relationship between the Myth and its other. For this purpose, Losev introduces a new category—the Symbol. The Symbol is

that aspect of the myth which is specifically expressive...the outwardly-manifested face of the myth (26).

Expression by itself has symbolic nature. However, Losev uses the category of the symbol to describe expressiveness at the specifically intelligent level. The other of the Myth as an intelligent entity is understanding, which means that it includes the environment, the fact of being perceived and understood. The symbol then will be that specific aspect of the myth that allows it to manifest itself outwardly in its other. The myth that has undergone the process of becoming or expression, that is taken as fact (stage four) is the Person, the "I," an absolutely unique entity. The fact that is intelligent, however, again includes its being perceived, or its environment. This means that every Person has a Name which denotes the manifested aspect of the Person, its signification, the Person's relationship with the outer world. It must be remembered, however, that the intelligent fact is still the last element in the Tetractyde. There is nothing outside the fact. The relationship with the "environment" is happening precisely at the level of symbol or intelligent fact. At this level the symbol and expression include the environment. The otherness which, in this

case, is understanding coats and encloses all intelligent expressive levels without extending beyond the fourth element.

It is hard to describe the way the symbol functions better than Losev himself:

*Eidos* knows in the world only itself, and its differentiation is differentiation in itself. The person, being a fact of the myth, only demands that it itself perform differentiations in itself and posit the other to itself in itself. However, the name, or expression, is such an aspect of *eidos*, myth and person in which they differentiate themselves...from the surrounding being-other, from the outer otherness. There we had a meaningful, or essential, differentiation and otherness; here we have differentiation beyond meaning and essence. And when the person mythico-cidetically differentiates itself as a whole from all other, compares itself with the latter and, therefore, becomes aware of itself also from the outside—such fullness of intelligent self-awareness is the name, and not simply the meaning and *eidos*; it is expression and form, and not simply the essence, albeit mythical and personal (28-29).

And so *eidos*, myth and symbol start “not only to express themselves and remain in this self-enclosed-ness and self-contained roundedness, but also to open themselves up to all other, apart from themselves,” start “to shape, enlighten, mythologize and symbolize also all other apart from themselves” (30).

It is only now, after outlining the series of preliminary categories, that Losev introduces the most abstract definition of artistic form. Artistic form belongs to the level of “understanding,” or symbol—the intelligent form of expression of the myth (or intelligent *eidos*) at the intelligent level of the Tetractyle. However, artistic form is not just understanding or expression, but the one that is characterized by absolute “adequacy”—it is a particular mode of understanding or intelligent expression.

Artistic expression, or form, is expression which expresses the given reality wholly and with absolute adequacy, so that there is neither more nor less meaning in the expressed than in that which is being expressed. Artistic form is born when in an offered meaning-generating reality all is understood and acknowledged in the way that it itself demands. Artistic form is form which is given as an integral myth, integrally and adequately understood. It is the otherness beyond meaning which adequately reproduces this or another

meaning-generating reality. It is the otherness that has generated an integral myth. It is the alogical otherness of meaning such that one does not have to reduce it to the initially given abstract meaning in order to understand it. And it is meaning which is understood by itself, without reducing it to its external allogical given-ness. The artistic in form is an essential equilibrium between the logical and alogical elements (35).

Having described all the main categories pertaining to the thinkableness of artistic form, Losev proceeds to the detailed analysis of these categories in application to the notion of artistic form. He uses the method of antinomies (or antinomies, as he calls it)—thesis, antithesis and synthesis. Although the analysis of the abstract Tetractyle with respect to artistic form is very elaborate, I shall restrict myself to just a few remarks. It must be remembered that, as before, all the more abstract categories are contained in the more concrete ones which are analyzed later. Artistic form pertains to the level of expression which appears as a mediator between the meaning (or *Eidos*, Myth) and its other. Losev stresses once again that at the level of artistic form the transition of meaning is “not simply into the other, but...into human consciousness, i.e., it is understanding,” this level includes its “environment” (44). Although the abstract meaning always remains preserved, artistic form dialectically includes all its perceptions and interpretations. This is how Losev describes a concrete example of this dialectic:

a painting preserves in itself its artistic form which unmovably rests among all its spatial and temporal becomings, understandings etc. But a painting also preserves in itself the traces of spatial and temporal environment and becomes known in the conditions of such and such understanding of it... Depending on all these conditions, the artistic form that is really imprinted in a painting acquires infinitely varying forms. It is on the leash of its non-meaningful becoming and changes every minute...It reflects in itself the meaning of its non-meaningful becomings. It cannot be perceived without this environment... (56).

Most interesting in Losev's analysis are the specifically expressive intelligent categories: the myth and the symbol. As I have mentioned already, the other at the intelligent level is the way something is understood. However, artistic form is not just understanding but mythical understanding. Losev distinguishes two elements in artistic form: the unconscious which is independent

from understanding and the conscious. The specificity of artistic form lies not only in the fact that it must necessarily include the conscious element. This conscious element, or perception and understanding, the "environment," actively participates in the creation of artistic form and influences the perceived meaning.

Artistic form is not simply meaning-generating reality that is independent from its understanding, but first appears only as understood reality, so that understanding, by introducing something new, creates the very form of this reality... (62).

Another way of describing this reversed influence would be through the subject/object relationship at the level of life. Otherness creates a striving, or an impulse of the will, in the meaning-generating reality which, in turn, creates itself and appears freely. Artistic form is thus the identity of the subject and the object.

Artistic form is an accomplished myth, i.e. a living being, self-related and self-feeling. Here lies the dialectical solution to that mysterious, enigmatic spirituality which permeates any work of art. Simple and hardly interesting things of common use—chairs, couches, lamps—becoming works of art necessarily spiritualize, come to life, turn into a myth... (62).

The last remaining category is the symbol, or the expressive aspect of the myth. Losev explores the symbol in its artistic function in the so-called "antinomy of adequation." Expression, or symbol, Losev writes,

makes the meaning-generating reality appear, i.e. co-relate with the otherness beyond meaning, and makes the otherness beyond meaning, e.g., sensible, become meaningful. How does it happen if an artistic form results? It happens in such a way that the meaning-generating reality becomes manifest as a whole, that none of its elements remains unexpressed, that in its expression nothing is added or subtracted that would in this way hinder the adequacy of the expressed with that which is being expressed (64).

The reality that is wholly expressed, or the ideal of expression, becomes the goal and the beacon of the work of art, which Losev calls the prototype, or the first-image. The dialectic of the first-image, or a

specific structure which is the arena for the meeting of the mythical *eidos* with its being-other (77)

becomes the most important section in Losev's treatment of artistic form. The main idea is that there is a reciprocal relation between the image and its first-image. The image is not a mere reflection of its first-image. The image shapes and forms its own first-image as it emerges, and the first-image never exists separately from its image. The production or perception of a work of art is in some way always independent from any particular subject-consciousness. Artistic form always remains independent, simply using all other forms of reality, both material substance and individual consciousness as the media for producing itself.

Artistic form is...the first image of itself, or an image that creates itself as its first image, that becomes...its first image... (67). Beauty as if streaming through an artist, uses him as a certain tool, a pathway, a medium, in order to manifest itself in the world. The artist himself is a passive and mechanical instrument of its orders... (72).

Artistic form thus appears as a special kind of symbol: it is the expressiveness of itself as of its first image which happens with perfect adequacy.

If one wonders what all this means in terms of common sensical understanding, a few examples may suffice to clarify the situation. Losev's dialectic positions the phenomenon, or rather noumenon, of artistic form in a most general way. It means that if we would like to apply Losev's general definitions to particular cases, they are necessarily going to fit. Let us take, for example, the Heideggerian attempt to distinguish between a tool, a thing, and a work of art. The essence of a tool is fully expressed only in its usage, so its expression manifested in its perceived appearance will be inadequate. Inanimate things do not possess the level of life, and therefore cannot form an intelligent *eidos* which would make them unique. Animate or organic things (a flower, an animal) can, indeed, express their essence adequately in case of their perfection. However, they do not require, by their essence, the level of intelligent expression. They can stop at the level of a self-contained tetractide, without proceeding to the mythical and symbolic levels where their perception by the other would be required.

However, the value of Losev's approach is not in these simplifications. At the level of artistic form which, on the one hand, deals with concrete material artefacts, but, on the other, includes the intelligent, psychological and cultural environment in which the latter are perceived, a bridging and a symbolic connection is accomplished between the rational and the irrational. The reciprocity between the logical and the alogical which happens in the symbol tightly binds the alogical reality to intelligibility, which allows us to treat this "cluster" as a whole and effectively eliminates the opposition. The wholesome and integral approach which is suggested by the nature of the symbol, which includes both the concealed and the unconcealed elements, is certainly neither full presence nor clear conceptuality. And still such symbolic connection is a kind of intelligibility and knowing already. And its value is not in the ability to think something to the end conceptually but in the elucidation of the nature and stages of the transition from unintelligibility to intelligibility and in exploring the conditions of this transition and its phenomenological happening.

Appendix<sup>7</sup>

## A. F. Losev: The First Dialectical Tetractyde

1. We do not yet know anything or affirm anything. We take the One. What exactly this One is, is not important, for we take precisely the category of the One which is everywhere, in all things, one and the same. Here we derive first of all the pure One which is as such non-distinguishable and is an absolutely indivisible one-ness. Take this particular clock that is standing on the table. Although in reality it consists of many parts, nevertheless according to their meaning they are a certain one-ness that cannot be divided into anything else anymore. Now take all the things that constitute the world. Thought demands that they be, first of all, some indistinguishable One, a one-ness, that all being in it merge into supra-being, into primordial unity which is already an individuality and continuity that is no longer divisible into anything else. If we take being in its entirety, it already has nothing from which it could differ and, therefore, it has no borders whatsoever; it means that it is above borders, above any circumscription, above meaning, above knowledge, above being. Such is the one-ness of the world as a whole, such is also the one-ness of each thing in particular (in respect to particular parts of the thing). Thus the beginning of dialectic is unthinkable-ness, supra-thinkableness, absolute one-ness which is neither this nor that, not any particular thing at all but the potentiality of all things and categories.
2. However, to remain on the ground of unthinkable, supra-ontic, merely potentially definable essence would be to give in to metaphysical agnosticism, to the dualistic teaching of "things in themselves." Thought, first of all demanding unthinkable-ness, immediately after demands the positing of this One, demands the being of this One. The One is already not merely One, but it also is. When the One is only One and nothing else, it is not One at all and is, in fact, nothing since it does not differ from anything. But now the One is One, the One exists. What does it mean? It means that it differs from the other, is circumscribed within its own borders, becomes something, is defined, becomes meaningful and acquires shape. From now on, it is not just the indivisible One but also the divisible many, for it has assumed a border. It has received an outline and therefore became meaningful. It has become something definite and therefore being. It is such one-ness that is given as divisible plurality.

3. Can we stop at this? No, dialectic goes further using its main method of contradiction. We began by fixing a certain point, a certain One, a one-ness. Then we found that this one-ness is already not one-ness but plurality. It is at this point, where abstract thought comes to a stall, that the real domain of dialectic begins. The One is both One and many. These thesis and antithesis must be reunited in one synthesis: a new category which is already neither merely One nor merely many. How does it happen? The One became many merely owing to the fact that we had placed it in opposition to the "other." The "other" is not some new One, for in this case the first One from which we had begun would already not be simply One, but One of many. Nevertheless we had to establish the One as a certain all-embracing one-ness beyond which there is nothing "other." Now we take this absolute one-ness in opposition to the "other" (it is assumed, however, that the "other" is not some new One, but only an aspect of the original One). What is this aspect? As we have said, it is the other. It means that it is precisely not-One, just as, obviously, it is not many, for the many as such is also a certain One. It is only this pure other, pure other-ness, pure not-One: not in the sense of a new One but in the sense of a certain principle of the same original One. It is the becoming of the One. The One itself is the other of the other and, therefore, itself contains its own other, i.e., is a becoming One. It is here that the synthesis we are looking for is found: the synthesis of the thesis of the One with the antithesis of the many and, therefore, the other. And, indeed, becoming demands that there be something that becomes: absolutely identical in all the aspects of its becoming, for otherwise there will be nothing to become. On the other hand, becoming demands that that which becomes be other and other all the time, for it is only thus that the very becoming can be accomplished. It means that becoming is a dialectical synthesis of the One (pure being-ness as such) and the other (the principle of manifold being-ness in general). With all that, one must always keep in mind the peculiarity of this third aspect as opposed to the first two. The first is above all being and knowledge, above definition. The second is a full and stable determinate-ness and divided-ness. The third is a further absence of dividedness, however, already not in the sense of unmoved one-ness but in the sense of the mobility of becoming. If the second principle is something logically divided, we can think of the third principle as of an a-logical dividedness; and if the second principle is an absolute coordinated dividedness and determinateness, the third principle is the continuity and uninterrupted-ness of becoming in the sphere of this dividedness.

- Therefore it is an alogical becoming. But since the third principle is a synthesis of the first two, and the second is dividedness and intelligibility, the latter aspect is nevertheless contained in the third principle, and therefore the third principle is the alogical becoming of logically divisible unity.
4. Becoming is a synthesis of the One and the other. The One, having been placed in opposition to the other, became many. The many, having been placed in opposition to the other, became becoming. What will become now of becoming itself if it demands its own other? For, according to the main law of dialectic that we have derived, any dialectical definition is accomplished through opposition to the other and the following synthesis with the latter. Let us now try to define dialectically becoming itself. For this reason we place it in opposition to its own other. What does becoming demand, in this situation? It demands the become, the fact, that which is at hand, which would carry becoming within itself. Just as the other becomes many after receiving within itself the One, and just as the other becomes becoming after receiving within itself the many, so the other, after receiving within itself becoming, most necessarily is the become, precisely that which becomes. However, by carrying on itself the third principle, the fact also carries on itself the whole complete meaning of the triad.
  5. Here ends the necessary dialectical definition of the thinkable in general. Dialectic is, of course, far from being exhausted by this. However, we will immediately demonstrate that the established tetractide provides the necessary definition of the thinkable and being in general that is quite finished in itself. The further categories of dialectic differ from the first tetractide as a new specific group of categories. Indeed, if we are to employ a common method of dialectical transition we must ask a question: what will happen to the "other" if we think about it as having received our fourth principle, i.e., the fact? The fact is placed in opposition to its other. Just as the many was the breaking down of the One due to the introduction of otherness, and just as, further on, becoming was the breaking down of the many due to the same reason, and just as, finally, the fact is, in every particular moment of its becoming, the same non-becoming fact and therefore poorer than the creatively growing becoming—exactly so that new entity which we dialectically look for after the first tetractide will be nothing other than the breaking down of the fact, the disintegration of the fact, that or another partial manifestation of it. Even without starting to formulate those new categories, we already see beforehand that all new developments will be merely a partial reflection of the first tetractide and that, therefore, the first

tetractyde is really something independent and finished. Therefore it can set a limit to the dialectical derivation of thinkableness in general. However, there is one more category which seems to reach beyond the limits of the first tetractyde and which we must touch upon, since it starts to play the leading role precisely in the problem of artistic form. It comes down to the following.

6. The tetractyde is finished in itself. All further analysis would already deal with its partial and deficient aspects. However, there is absolutely no necessity, immediately after the derivation of the first tetractyde, to start speaking about its other, for the latter is understood as having received the first tetractyde in that or another degree. By thinking the other of a given category, as has been determined above, we, indeed, always move on to the limiting of the given category and, consequently, to the hypothetic or actual realization of the given category as limited and, furthermore, deficient from this point of view. However, instead of this, it is quite possible not to move on in reality to subsequent categories and not to bring forth new categories with the help of the one that has been derived, but only to think the given category as merely co-related with the other, as if coated with its other. It would mean to view the derived dialectical category as the potentiality, potency and principle of all kinds of incarnations of the given category in the further other. It would mean to pass from the fact, that carries within itself the meaning of the triad, to its expression, or form. The expression of the fact is the fact that is differentiated from its surrounding other. Expression is not meaning, for meaning (our second principle) presupposes the other only inside itself; it is the self-divisibility that is taken itself in itself. Expression, or form, is the meaning which presupposes the other outside itself, which is co-related with the other that surrounds it; it is the self-divisibility that is looked upon from the point of view of the other that comes in from the outside. What does it mean that a given thing expresses something? It means that the meaning of something rests upon this thing, that the meaning of something is embodied in this thing. But for this, it is necessary that there be expression in general—as that which implicitly contains in itself an infinite number of its various incarnations and formations of innumerable kinds. This is precisely the expression, or form, of which we speak, i.e., the meaning that has transgressed the limits of its divisibility and has been co-related with its outward otherness, but has not yet incarnated into anything, although being able already to incarnate into everything. It is given here as yet merely as its own incarnate-ness—in itself, as a limit and, therefore, potentiality of all possible incarnations. In accordance

with the general dialectical antinomies, we can formulate, at this point, the interrelation between the essence of the tetractyde, that has been defined above, and its expression.

**Thesis.** The expression, or form, of the essence, in respect to its fact and being, differs in nothing from the essence itself; it is the sole fact of the essence. Expression is inseparable from the essence and therefore is essence itself.

**Antithesis.** The expression, or form, of the essence is different from the essence, for it presupposes something other which exists apart from the essence (and in which it manifests itself).

**Synthesis.** The expression, or form, of the essence is the essence that becomes in its other, constantly flowing with its meaningful energies. It is the potentiality and assurance of any kind of functioning of the essence outside itself. It is the firmly outlined face of the essence in which the logical meaning is identified with its alogical manifested-ness and given-ness. Generally speaking, expression is the symbol.

# **Aesthetics as a Philosophic Ethos: Plotinus and Foucault**

**Robert M. Berchman**

## **Introduction**

This essay aims at retracing two conceptual moments of a history of the soul and the self within the "horizon" of aesthetics.<sup>1</sup> The field of aesthetics is one in which sediments of such a history are most visible and perhaps richest in meaning. Thus the attempt is made in this study to hold on to both ends of a fragile, complex chain: initially, to recapture definitions of art, aesthetics, and the soul at the close of antiquity in Plotinus. Next, to represent definitions of subjectivity where they have been most strongly formulated in our present age with Foucault.

A single focus, consequently, and four problematics generally define this paper. The human subject is the focus. The problematics are the specter of the isolated subject, the relation between art and truth, the notion that we construct our ontological and axiological positions by recourse to an aesthetics of the soul and of the self, and most importantly for this study, the value both Plotinus and Foucault see in art and aesthetics for the overcoming of the fallenness and isolation of the self in later antiquity and later modernity.

Some brief statements on the self, the subject, and subjectivity are apposite. To avoid misunderstanding it is not my intention to provide a history, or even an outline of these concepts in antiquity and modernity. Briefly, my purpose is to point out the importance of these concerns as they impact upon the thought of Plotinus and Foucault.

## I. The Self, the Subject, and Subjectivity

There is no real blood flowing  
through the veins of the knowing  
subject constructed by Locke, Hume,  
and Kant, only the diluted juices  
of reason, a mere parade of thought.

Dilthey, *Selected Writings* <sup>2</sup>

The concern with subjectivity in antiquity begins with an interest in the problem of knowledge. In terms of the subject-object relation it is fair to say that Parmenides, Heraclitus, Plato, Aristotle, and Plotinus stress the objective aspects of this relation. Being, Logos, the ideas, substance, and Nous satisfy a normative requirement for an invariant object understood as a necessary condition of knowledge, the object that is known, and the subject that knows.

The concern with subjectivity in modernity, as part of a heightened focus on the foundations of knowledge, shifts the emphasis from the object to the subject of knowledge. Beginning with Descartes the view of the subject is dependent on the concept of the individual. Here the *cogito* becomes the basis of objectivity. This "turn" is subsequently heightened and refined, at least in the continental traditions, by Kant, Hegel, Husserl, and Heidegger. Here it is proposed that the subject is the condition of objective knowledge and that subjectivity is the key to objectivity. We need merely to be reminded of Kant's transcendental unity of apperception, Hegel's substance becoming subject, Husserl's transcendental ego, and Heidegger's *Dasein*. Each of these concepts is introduced to support a claim to know not in a subjective sense, but in an objective sense. That is to say, a proposition is raised that resonates to this day in contemporary philosophy—that subjectivity is the key to objectivity.<sup>3</sup>

Now this "epistemological turn" from objectivity to subjectivity is not the concern of this essay although it impacts upon what is the focus of this study. The "aesthetic turn" has as its focus the subject and its clue to its value in the world. As such, the focus here is ontological and ethical. Indeed, in the case of Plotinus and Foucault it appears that the subject-object problem is an elision largely

solved. The concern they primarily address is the subject-value relation. Plotinus' theory of knowledge turns on a foundationalist conception of *Nous* as the indubitable ground of the soul and knowledge. Moreover, he argues that perception is a type of knowing whereby the soul grasps the ideas aesthetically. Furthermore, he proposes that aesthetic knowledge transforms the soul in terms of its value in the world. This insight reformulated by Baumgarten, Kant, and Hegel is reassessed by Foucault on Nietzschean and Heideggerian terms. He proposed that to be in the world required a knowledge of how to be aesthetically in the world.

The leading theme of this whole story, accordingly, is the notion of an extraordinary concept of the self as subject. This is the soul of Plotinus whose nature and ambitions are soberly ecstatic, unprecedentedly hypercosmic, and the self of Foucault who is uniquely autonomous and remarkably self-constrained. The soul of Plotinus and the self of Foucault are no ordinary subjects. The soul is not merely the singular self. It is rather self as such, the soul of humanity, whose *telos* is an imaginative, ecstatic union with a hyperreality—the One. For Foucault the individual is the singular self as such, the individual, whose goal is the creation of an "aesthetics of existence," which finds expression in a radical autonomy of the self.<sup>4</sup>

Despite remarkable differences between these "horizons of the self" one insight links Plotinus and Foucault—"the aesthetic pretense." Fully developed this pretense has two central components: first, the remarkable inner richness and expanse of the soul or self; and secondly, the consequent right to project from the undescended and subjective structures of one's own mind to ascertain the nature of human value and the destiny of subjectivity as such. That is to say, an "aesthetic pretense" accompanies this self as an mode of experience fundamental to the attainment of wholeness and freedom. As such, the aesthetic structures of one's own personality establish the conditions for the possibility of ethics.

Now these advocates of "aesthetic pretense" really thought they could change the subject, and sometimes they probably did. Indeed, an appreciation for their lack of modesty is essential for understanding their aesthetics and ethics. Their imaginative, if sometimes abstruse efforts aimed at changing human beings. They thought of themselves as sages and revolutionaries. In this sense,

the "aesthetic pretense" as argued by Plotinus and Foucault is not so much about the study of knowledge as it is about the human being concerned with being, as the clue to being. Indeed, both offer dramatic stories of a philosophical self-image in which knowledge and reason play an important role in the cultivation of the self, but only alongside perception, imagination, feeling, and creativity. And as such, Plotinus and Foucault represent a minority in the history of western philosophy. That is to say, they are representative of those isolated philosophers who valorized aesthetics and marginalized reason in the cultivation of the subject.

## II. Art, Aesthetics, and the Self

Very early in my life I took  
the question of the relation of  
art to truth seriously: even now  
I stand in holy dread in the face  
of this discordance.

Nietzsche, *Nachlass*, xiv. 386

A specter haunted later ancient and contemporary thought: the specter of the isolated subject.<sup>5</sup> In fact many aspects of ancient and contemporary culture bring forth the suspicion that the individual's relation to the world is undergoing a profound dislocation, and that the relation to the idea of an objective universe, simultaneously transcending the subject and uniting the self to others has become singularly problematic.

Moreover, the discordance of art and truth, in the face of which Nietzsche felt holy dread, is as old as philosophy itself.<sup>6</sup> The proposition that art stands in second relation to the true for the intelligible world is always superior to the sensible world can be traced back to the "construction" of the metaphysical Plato, with his two-world theory, his denigration of corporeality, and his celebration of eternal immutable ideas which are the erotic *telos* of *dianoia* and *noesis*. The realm of *aisthesis*, consequently, was the sign of the human condition, of limited knowledge.

In the wake of such a judgement Plato challenged the authority of Homer and expelled artists from the republic that was to be

grounded in reason and truth alone. Since the cosmic order was viewed as closed, hierarchical, and purposeful by Plato, the idea of the beautiful was associated with the bringing into reality by the artist of an order where measure and proportion ruled.<sup>7</sup> Moreover, the beautiful object was understood as a sensible presentation (an illustration) of the true, as the transposition into the sphere of the material sensibility of a moral or intellectual truth. A work of art, subsequently, is the mere reflection of the idea of the beautiful. It is the idea of the beautiful that furnishes the work of art with its authentic meaning from without.

There is a dread of art and aesthetics for two reasons: first, art is mere art, and as such it is merely a matter of taste; secondly, art and aesthetics always appear to be outside of truth, reason, and morality. If art and aesthetics appeared as somehow more truthful than noetic or empirical truth, more rational than methodical reason, more just than liberal justice, more valuable than principled morality or utility then the very foundations of *episteme* would crumble. That is to say, the claim that art is somehow more than reason is always disturbing. It is undemonstrable and incommensurable with what truth saying and valuing are thought of in the shadow of Plato.

As such, the discordance of art and truth, in the face of which Nietzsche felt holy dread, stands over and constitutes modernity more so than it did over Plato's utopia. Few philosophers after Plato placed art and aesthetics at the center of the constitutive, cognitive, and practical mechanisms that produce society. The reasons are not difficult to discern. Art, and the theoretical discourse that comprehends art, speaks its own voice and this voice lies outside truth, goodness, and reason. Two philosophers will challenge this perspective—Plotinus and Foucault.

## III. Plotinus

In the aesthetic mode of  
contemplation we have found two  
inseparable constituent parts -  
the knowledge of the object, not as  
individual thing but as Platonic  
idea,...and the self-consciousness

of the knowing person...as pure  
will-less subject of knowledge.

Schopenhauer, *The World as Will and Idea*<sup>8</sup>

#### A. Perception and Intellection

Plotinus stolidly maintained the priority and superiority of intellection over perception as laying the foundations for physics, and subsequently for psychology and epistemology.<sup>9</sup> Nonetheless, his view of the plastic arts is decidedly novel.<sup>10</sup> First, he claims that art is a visible expression of ideal beauty.<sup>11</sup> Second, he asserts that the ideas of beauty exist in the human soul.<sup>12</sup> Third, he claims that the imagination is the mental faculty through which the soul gains initial awareness of ideal beauty.<sup>13</sup> Fourth, this aesthetic awareness leads, eventually, to knowledge of the ideas of beauty, if not the beautiful itself.<sup>14</sup> Fifth, and perhaps most importantly, he claims that the arts are a means for the soul to reverse a situation of misfortune—her descent into corporeality. For through the arts and the aesthetic imagination the soul regains her awareness of her intelligible origins and, consequently, begins her ascent from sensibility to intelligibility.<sup>15</sup>

Yet Plotinus' powerful defense of aesthetics is, accordingly, based on something far more profound than a reappraisal of the value of the plastic arts themselves. For the origin of all symbolic activity, including artistic activity, emerges from the fact of the soul's descent and its ignorance of its authentic undescended state.<sup>16</sup> Even though the higher soul remains in the intelligible world the lower soul is unconscious of this fact.<sup>17</sup>

#### B. The Undescended Soul and the Active Intellect

Goodness and beauty are known to the higher soul but not the lower soul. For only souls motivated by intellect and illuminated by beauty know goodness.<sup>18</sup> These souls are exceptional and conscious of their undescended selves.

The higher soul always remains united with intelligible being; the lower soul is unconscious of this link. Involved in the sensible world, in the tumult of the body, she is unconscious of what the upper part beholds.<sup>19</sup> Busied with carnal desires she knows nothing of her divine link.

What of these souls, unconscious of their undescended selves, and ignorant of the eternal verities? For:

living under a crust of evil...filled with injustice and desires, torn by internal strife, full of the fears of its own cowardice and the jealousy of its meanness, busied in its thoughts about the perishable and the low, the friend of vile pleasure, it lives a life of submission to bodily desires.<sup>20</sup>

There is a way out of this situation of misfortune. Through apprehension of aesthetic symbols the soul becomes aware of the forms and begins her tenuous ascent from unconsciousness to consciousness.<sup>21</sup>

Visible beauty points to soul to intelligible beauty.<sup>22</sup> In this sense art functions to make the soul aware of her divine source. Once conscious this soul becomes aware of her eternal, intelligible link to the divine. For through the aesthetic imagination the soul unites her disparate self and begins her ascent to the eternal verities and, perhaps, eventual union with the divine.<sup>23</sup> Consequently, art is therapeutic. It assists in the transfiguration of the soul from unconsciousness to consciousness, from an awareness of its sensibility to a knowledge of its intelligibility.

For Plotinus, then, the psychological and ontological shift from unconsciousness to consciousness, from misfortune to fortune, involves the use of the imagination, the active intellect, and at times, the plastic arts. Art, thus, commits the soul to an upward passage, to an ascent from the lower to the highest divine beauty. Consequently, the various *artes* are accorded a valued place in Plotinus' system.<sup>24</sup>

Logic, observation, and piety all reinforced this position. For Plotinus there was something grotesquely impious in the idea that the sense-world was devoid of the forms or that physical objects, even objects of art, could not awaken in the soul images of the eternal verities.

#### C. The Imagination and Intelligible Beauty

Plotinus' judgement is understandable, only when it is coupled to his psychology and epistemology.

Plotinus rejected Plato's tripartition of the soul. Moreover he accepted Aristotle's view that knowledge is a function of a series

of psychological faculties.<sup>25</sup> Although Plotinus does not settle on a definite scheme of faculties, his acceptance of Aristotle's view of the imagination plays a decisive role in his aesthetics.<sup>26</sup> With these concessions, Platonism finally comes to terms with the insights of Aristotelianism.

Among the most important of the Aristotelian elements in Plotinus' system is the notion that an actively thinking mind is identical with its objects.<sup>27</sup> He also accepted Aristotle's view that sense-perception involved the reception of the forms of sense-objects without their matter.<sup>28</sup> As Alexander insisted, the absolute certainty of knowledge springs from the fact that it has its origins in perception.<sup>29</sup> This is the complement of Plotinus' observation that the physical world is a self-contained, cogent, and certain instantiation of the noetic world.<sup>30</sup>

This is possible because the soul is self-moving. Always in movement she is in contact with those intelligible faculties active within her even though she is unconscious of them. The lower soul becomes conscious of her higher self when the active intellect transmits to the imagination an image of the forms. This occurs when the soul views an art form. This triggers memory of the intelligibles for the soul sees the form of beauty in the work of art.

There are two faculties of imagination. One arises in regions of the soul concerned with the body. Another emerges from the part of the soul concerned with the intellect.<sup>31</sup>

Plotinus says that the secondary act of imagination which is opinion in the soul is caused by disturbance and shock. Thus it is the product of the lower part of the organism. Its images are a faint opinion and unexamined mental picture.<sup>32</sup>

However, it is not secondary but primary imagination that is important in Plotinian aesthetics. The primary imagination has images of the forms passed on to it by the active intellect and the higher soul.<sup>33</sup> The *logos* deploys the thought and shows it to the imaginative faculty as though in a mirror. This presentation of thought to the imagination makes us aware of the intellection (*noesis*) which is always in progress. The imagination apprehends it and the persistence of the image is memory.

The imagination (*phantasia*) receives the products of thought (*logoi*) and perception (*aisthesis*).<sup>34</sup> These products are, then, passed on to the reasoning faculty for processing.<sup>35</sup> Imagination is, accordingly, based on something far more profound than an

awareness of physical conditions. It carries a meaning close to the idea of consciousness.<sup>36</sup> This means that the imagination is a power of perceptive awareness that transcends sensation. Significantly, it refers to that mental faculty which provides knowledge of the intelligibles above and within the soul.<sup>37</sup>

This assures for Plotinus the possibility of memory (*anamnese*)—the becoming receptive on the part of the lower soul what the higher soul eternally beholds<sup>38</sup>—for image-collecting is the basis of memory.<sup>39</sup> Memory, in turn, plays an important role in Plotinian eschatology and psychology.

For Plotinus believed in reincarnation, and assumed the form in which the soul is reincarnated depends on its previous life and conforms to the characteristics of that life. For example, the way the soul preserves its character between reincarnations is through memory. Memory makes the soul what it is and controls its descent.<sup>40</sup>

As noted Plotinus assumed that souls move from an unconscious to a conscious understanding of the intelligibles<sup>41</sup> and the way the transition is made is through memory.<sup>42</sup> For example, the imagination fired by its perception of a statue of a god remembers the form of the god and moves from an unconscious to a conscious awareness of the divine.<sup>43</sup> Thus art plays an important role in the way consciousness of the higher soul and the intelligibles is achieved by the lower soul.<sup>44</sup>

For images of the forms are transmitted to the imagination through sense objects. Accepting the Aristotelian postulate that sense-perception involves the reception of the forms of sense-objects without their matter Plotinus says:

On what principle does the architect when he finds the house standing before him correspond with his inner ideal of a house and pronounce it beautiful? Is it not that the house before him, the stones apart, is the inner idea stamped on the mass of exterior matter, the indivisible exhibited in diversity? We call something beautiful when we see something imprinted on it that we recognize as our own, by virtue of our continuity with the ideal world, and the immanence of that world in the object where we recognize beauty.<sup>45</sup>

Art objects also move the soul to imagine the form of beauty. This notion is forcefully presented in his work *On the Intelligible Beauty*.<sup>46</sup> Plotinus describes an intelligible world in unity with the

sensible world. The capacity to grasp this synthesis leads the mind to an understanding of beauty. Next, he examines the imagination and shows how it aids the soul in its ascent from sensible to intelligible knowledge. Finally, he illustrates how the craftsman and his *artes* concretely instantiate in visible form the intelligible world's truth and beauty.

Plotinus describes an intelligible world whereby each member remains itself, in distinction from all others, yet simultaneously all members form a single unity. He asks us to imagine a transparent globe or sphere containing all the things of the universe. Then he asks us to correct it by imagining another sphere stripped of all magnitude and spatial differences. Next we are urged to make a synthesis wherein each is all, one undivided divine power of many facets, each sharing one existence and remaining distinct from all others.<sup>47</sup> This is the beautiful.

Plotinus strains to lead our minds to the higher world of the forms and argues that sensual images lead us on our ascent. To correct the conclusions we might draw from the first-level image, he asks us not to abandon imagery entirely but to imagine another sphere, one whose properties run counter to the first. The deficiencies of image-thinking are eventually corrected by bringing the sense-image to a second stage and then urging our metaphysical imaginations to leap beyond this stage as well, to the desired insight into the intelligible realm. Central to this process of ascent is not of abandoning or turning away from the sensible world but of using imagery and the faculty of imagination to the point of strain and shatter. At the moment of shatter, intelligible insight occurs.<sup>48</sup>

The ingredience of the higher in the lower world suggests the fecundity of Plotinian aesthetics. He illustrates this in his comparison of hieroglyphics and art. Both suggest non-discursive images of the intelligible world—the ideas are not propositional truths but reified beings (*onta*).<sup>49</sup>

Moreover the ideas are envisaged as *agalmata*, each bodying forth in a species of translucence the inner wealth of the intelligible world's truth and beauty. Thus the individual who has seen this world of beauty will become his true self, even in this sensible, corporeal world, a concrete embodiment, in and through which others catch the glimmerings of the transcendent splendor of the forms.<sup>50</sup>

For Plotinus one such *agalma* is the artist, another the artist's creation. Thus the craftsman's task is, first, to imagine the ideal specification to which reality conforms, and then—so far as the nature of matter permits—to arrange it in conformity with its ideal specification.

A sculpture, for example, represents the creative ideas contained in the soul of the artist. With the assistance of the imagination the artist in an inward vision grasps the forms intuitively. Next the craftsman projects the intelligible beauty of the forms outwards, giving them visible form.

This understanding emerges from his interpretation of Phidias' statue of Zeus. Plotinus states that:

...it goes back to the ideas from which nature itself derives and adds where nature is lacking.<sup>51</sup>

The craftsman's work instantiates the form of beauty. It reflects the *he kallone*—the beauty of deity itself. The sculpture, then, functions to awaken in other souls an imaginative awareness of the ideas from which all else derives.

Plotinus suggests that such awareness leads to psychological enlightenment for the soul is the immovable place or subject for the immutable truth of the higher world.<sup>52</sup>

What do you feel in the beauty of souls? When you see that you yourself are beautiful within, what do you feel? What is this Dionysiac exaltation that thrills through your being, this straining upwards of all you soul, this longing to break away from the body and live sunken within the true self? These are no other than the emotion of souls under the spell of love...All these noble qualities are to be revered and loved but what entitles them to be called beautiful? Everyone that sees them must admit that they have reality of being, and is not real being, really beautiful?<sup>53</sup>

#### D. Aesthetic Symbols, the Soul, and the Arts

Note carefully that Plotinus' understanding of intellectual beauty confirms a new Roman rhythm. His terminology—imagination (*phantasia*), exaltation (*ekstasis*), love (*eros*), and emotion (*pathe*)—affirms that the intelligible world and its divine source can be grasped not only noetically, but also aesthetically. In a remarkable reversal of an older aesthetic pattern,

divine apperception involves *patheia* not *apatheia*. Another *via sacra* opens up; one which involves non-discursive, indeed imaginative and erotic ascent to the divine. Plotinus is toying with a sweeping hypothesis.<sup>54</sup>

Although the theme is strongly reminiscent of the Platonic Socrates, that Silenus figure which, once opened, was seen to contain the images of the gods within him, the Plotinian Phidias and that Zeus figure are strikingly distinct.<sup>55</sup> Plato often returned to that mysterious, youthful experience, to that encounter with the beloved which is simultaneously an encounter with a transcendent world of value that stretches beyond the "concrete person" involved in the encounter.<sup>56</sup> Plotinus reflects and expands upon this encounter and includes within the *agalmata*, that permits encounter with the intelligible world, factors which Plato never countenanced—the imagination, the active intellect, and the plastic arts. These forms are communicated to the soul by the active intellect through the image making faculty of the soul in reflection on the work of art.

The consequence of these assumptions propels Plotinus to propose, at least for Platonism, an unprecedented aesthetic axiology. Psychological and ontological "schizophrenia" are overcome aesthetically. The soul's unawareness of her higher self is reversed and her situation of misfortune overturned through imaginative, indeed, artistic perception. Aesthetics, then, is not only therapeutic, it is also a path to salvation.<sup>57</sup> Art assists the soul to leave the sensible world and terrestrial pollution and gain the intelligible world and celestial bliss.

The soul's descent into matter results in the unconscious splitting of the self. Her fall from the intelligible world also signals her separation from true reality and her embodiment in symbolic reality. This leap into matter is a function of a situation of misfortune. The imagination, the active intellect, and the arts are intimately linked to the reversal of psychological and ontological misfortune. Indeed, for Plotinus the arts present to the soul one of the greatest blessings a later Roman could obtain—full possession of the self, awareness of the forms, and ascent to the divine.

Thus, in turning to a statue or temple the imagination sees not merely a physical object but perceives an image of the forms. This, eventually, leads to an awareness of the eternal value of nature, the human soul, and the divine-like nature of both. An awareness of beauty is nothing less than a recognition of the value of the physical

world and of self. Through art the ontological distance between being and becoming is overcome in an epistemological and psychological act of imaginative identification.

For Plotinus the human soul contains within herself the ability to gain salvation. She has the ability to willingly save herself through contemplation (*theoria*).<sup>58</sup> Art and the imaginative perception of its inner beauty is a mode of contemplation which leads the soul on her ascent to the intelligible world. In this sense, Plotinus has an acute sense of the multiplicity of reality and self and a chain of intermediaries that reached, yet further still, from self to God. In *nuce*, Art functions to erase the distinctions between the layers of the soul, to bring the ontologically distant epistemologically present.

*Aisthesis* is nothing more than the lower soul becoming conscious of what the higher soul eternally beholds. *Phantasia* is nothing more than the presentation to the lower soul of an *antilepsis* which permits her to identify her empirical self with her pure, true self that transcends the sensible. Art serves to heal the disparate self. It brings that which is so noetically distant, sensibly present. It is about the joining of heaven and earth in the human soul.

Thus, the dangerously long distance between being and becoming, consciousness and unconsciousness is overcome through an aesthetic that stresses the possibility of unanimity between subject and object. Such identification makes the soul conscious of her intelligible beauty. Such consciousness leads the soul upwards to divine beauty and wholeness itself.

To conclude: In the second half of the third century, we find ourselves caught up in an aesthetic transformation which is still incomplete. Plotinus fractures the foundations of earlier Platonic aesthetic theory. Bit by bit, the static framework of the noetic world, on which Platonic metaphysics rested, is dismantled. By now, the ineffaceable character of forms and gods, which earlier Platonists saw as the ultimate justification of a *mimesis* between the intelligible and sensible worlds, between intelligibility and sensibility has been dissolved aesthetically. Art as Plotinus hints all along—no longer belongs to the sensible world alone.

This discovery has three aspects. It compels Platonists to recognize the value of perception—something they might guess, but before Plotinus could not prove. Secondly, it establishes the veracity of the imagination because later Platonists have come to

understand the general processes by which it works: its link to the higher soul and active-intellect provides proof of its intelligibility. Thirdly, it establishes the conditions for the possibility of rendering nugatory the specter of the isolated subject and the discordance between art and truth.

What may be called Plotinus' "aesthetic shift" has its grounds in his valuation of the natural world, his concerns about the "fall" of the soul, and his desire to expand its horizons by rendering nugatory the unconsciousness of *aisthesis* and the arts. Significantly, all these ideas resonate well beyond Plotinus in a contemporary philosophies with his concerns about subjectivity and an aesthetics of the self. It is to these issues we now turn.

#### IV. Foucault

Our age is, in especial degree, the  
age of criticism, and to criticism  
everything must submit.

Kant, Preface to *The Critique of Pure Reason*<sup>49</sup>

There has been an explosion about the term "postmodernity" which is difficult to pin down. Heidegger called such an amorphous, elusive protean debate a *Stimmung*. Indeed, "postmodernism" is perhaps the most controversial intellectual movement of our times. There are those who think that it is a clever intellectual fraud, a harbinger of nihilism, a whimsical destroyer of any canons of rationality, a self-indulgent scribbling that delights in irresponsible word play, punning, parody, and even self-parody. With wit, barbs, and deft swift movements, this movement is the slayer of the tradition of western metaphysics and logocentrism. This characterization is to say the least problematic, at least for Foucault.

The reasons are several. Many interpreters of postmodernism—and one should not place Foucault's thinking solely in a postmodernist context—have characterized the postmodern *ethos* as excluding all notions of truth, enlightenment, and self-understanding. Moreover, Foucault's genealogies of power/knowledge have been identified as exhibiting a Nietzschean

scepticism with regard to truth-claims or ethical values of whatever kind.

I would like to suggest that this picture incorrectly characterizes Foucault's later philosophical positioning.<sup>50</sup> Foucault's philosophical agenda is about criticism and the "decentering" of a variety of methodological and metaphysical *a priora*. In this sense its pedigree is an ancient one and its philosophical precursors include Socrates, Pyrrho, Sextus Empiricus, Montaigne, Voltaire, Kant, and Nietzsche. Those who read these thinkers and their heirs as merely celebrating formlessness and chaos are missing the Socratic sense, the Kantian deconstructive bite, which demands that there is no "boundary-fixing" that cannot itself be questioned.

In *nuce*, Foucault will continue this critical approach which can be identified with Kant's and Nietzsche's own critique of foundations. Moreover, his attention is drawn to the ethics and aesthetics of these thinkers in three ways. First, Kant and Nietzsche made freedom something that is necessarily outside the province of (theoretical) knowledge. Secondly, one of the radical novelties of Kant was the notion that we construct our meaning of life through ethics because it is through this medium that we endow ourselves with purpose. Thirdly, it was Nietzsche who suggested to Foucault that "living one's life as a work of art" is the *telos* of human existence.

#### A. Critique in the Modern Age

Kant taught us that what characterizes the enlightenment impulse is not dogmatism or the search for firm foundations, but its persistent questioning of the conditions and possibility of experience: including ethical-political experience.<sup>51</sup> Foucault's historical work was guided by a philosophical attitude derived from the Enlightenment values of human liberation and of autonomous human thought as an instrument of that liberation.

Foucault defined his project by comparing and contrasting it to Kant's eighteenth century critique of reason which was an attempt to make use of understanding without direction from another.<sup>52</sup> Kant thought that his own age was the beginning of reason's emergence as an autonomous force directing human life. Thus, reason itself required a careful assessment of its precise scope and limits. Thus, according to Foucault Kant indicated a way out of the

immaturity and the heteronomy that characterized human thought before Enlightenment. By immaturity Kant meant "a certain state of our will that makes us accept someone else's authority to lead us in areas where the use of reason is called for."<sup>63</sup> His motto was *aude sapere* and it must be construed "both as a process in which men participate collectively and as an act of courage to be accomplished personally."<sup>64</sup> Thus, "Enlightenment" is characterized by Kant as an ongoing process and as a task and an obligation to "problematize" existing readings of knowledge and truth.

Kant thought that the limits of reason derived from necessary *a priori* structures that defined the very possibility of our knowledge—that is, from formal structures with universal value. It is here that Foucault's project for a critique of reason differs from Kant's. Foucault is not concerned with determining the *a priori*, necessary conditions governing the exercise of reason but with a critical reflection on the extent to which such conditions have a contingent historical origin. Through such reflection—carried out by histories of thought—he attempts to show how we can free ourselves from the constraints of these conditions. Even free ourselves from the error of mistaking culture-specific claims for *a priori* valid truth-claims.

In this sense Foucault scarcely alters the agenda and axiology of the Kantian critique. His central concern is to articulate a critique of reason and an ethic premised on the values of autonomy, freedom, and self-determination attained through an exercise of practical will remarkably kin to Kant's own threefold question "What can I know?; What should I will?; and What may I reasonably hope for?" The crucial difference is in Foucault's way of posing these questions. He treats them in genealogical fashion as not belonging to a transcendently certain, but to a historically delimited configuration of knowledge, discourse, and the will to truth.

This shift represents an important reformulation of the cultural role played by reason. In brief Foucault abandons the traditional philosophical goal of grounding theoretical, practical, and aesthetic knowledge in an understanding of the essential, universal structures of thought and reality. Instead, he applies the philosopher's analytic and synthetic skills to the task of uncovering and dissolving contingent historical constraints on thought and action. As such Foucault abandons the venerable but empty pretension that

philosophy provides a privileged access to fundamental truths. That is to say, he rejects any version of the strong universalist premise that would hold such values to be more than contingent, more than just a product of own modernist attachment to "universal discourse."

In brief, Foucault inverted Kant's order of priorities. He demoted the claims of "transcendental" reason (or critique) to the status of a localized episode in the history of thought, and he identified truth with the level of contingent events or shifts in the order of power/knowledge relations that can best be revealed through his genealogical approach to thought systems. That is to say, the enlightenment project survives in Foucault in a sharply delimited form as the impetus to a kind of reasoned investigative thinking that does not characterize much of postmodernism. As such for Foucault Kantian questions still have a capacity to provide critical reflection on the ways and means of enlightened self-knowledge that exist for us now as subjects inscribed with a culture specific discourse.

Critique needs to be recast in such a form as to exclude any notion of "truth" or "critique" as values transcending this localized context of utterance. Thus: "How are we constituted as subjects of our own knowledge? How are we constituted as subjects who exercise or submit to power relations? How are we constituted as subjects of our own actions?" This remains among the most important of enlightenment questions for Foucault.<sup>65</sup>

These are the kinds of questions that have occupied thinkers from Kant to Habermas. But they differ that for Foucault self-knowledge can only arise through the exercise of a freedom created in the margins of an otherwise ubiquitous will to power whose watchwords are "reason," "enlightenment," and "truth." Hence the most important question for Foucault is: "how can the growth of capabilities be disconnected from the intensification of power relations?"<sup>66</sup> His answer is to shift the main burden from the relationship between knowledge and ethics (as developed chiefly in Kant's first two *Critiques*) to the relationship between ethics and aesthetics (as taken up in the last *Critique*). This explains Foucault's turn to an aesthetic perspective.<sup>67</sup>

## B. The Aesthetic Turn

There are differences between Kant's and Foucault's ways of answering the question "What is Enlightenment?" For Kant it is a matter of attaining intellectual and moral maturity through the exercise of criticism in its various modes, whether applied to issues of theoretical understanding (where intuitions must be brought under adequate concepts), to questions of an ethical or political order (where practical reason supplies the rule), or to issues in the sphere of aesthetic judgement where the tribunal can only be that of an intersubjective community of taste appealing to shared principles or criteria of value.

For Foucault this doctrine of the faculties is a "transcendental" illusion and in its place he offers an artistic and literary *ethos* which possesses no such universalist claims. Here the aesthetic moves to center stage as the focal point of everything that challenges, eludes, or subverts the truth-claims of a traditionally understood Enlightenment critique.

Following Baudelaire and Nietzsche, Foucault argued we should not go off to discover ourselves, our secrets and hidden truths. We should try to invent ourselves by ironically "heroizing" the present moment and the scope it offers for aesthetic self-creation.<sup>64</sup> This turn explains Foucault's focus upon a categorical imperative of ever more inventive variations on the theme of aesthetic self-invention that leads toward an *ethos* of "Private" (aesthetic) fulfillment.

If we are to see the significance of the question of the nature of the work of art and how this question is connected with the basic problems of philosophy for Foucault we must gain some insight into certain assumptions present in the Kantian concept of a philosophical aesthetics.<sup>65</sup> It was only with the explicit restriction of Enlightenment rationalism that the autonomous right of aesthetic knowledge would be first asserted by Baumgarten.<sup>66</sup> With these premises in hand Kant in his third critique—specifically the *Critique of Aesthetic Judgement*—argued for the independence of the judgement of taste from the categories of the understanding and its regulatory concepts.<sup>67</sup>

Kant established the problem of aesthetics in its systematic significance. Here he discovered in the subjective universality of the aesthetic judgement of taste the powerful and legitimate claim to independence the aesthetic judgement makes against the claims

of the understanding and morality.<sup>68</sup> According to Kant the taste of the observer can not be comprehended as the application of concepts, norms, or rules. The beautiful and the sublime cannot be apprehended as a knowable, determinate property of an object. Rather it manifests itself in a subjective manner—in the intensification of the "Lebensgefuehl" through the harmonious correspondence of imagination and understanding.<sup>69</sup>

What we experience in beauty or sublimity in nature and in art is the free interplay of our moral powers. These judgements of taste are not knowledge, yet they are not arbitrary. They involve a claim to universality that establish the autonomy of the aesthetic realm on the basis of the subjectivity of the mind's powers.<sup>70</sup> For Kant the determining factor was the congruity that existed between the beauty and sublimity of nature and the subjectivity of the subject. Similarly, he understood the creative genius who transcends all rules in creating the work of art to be a favorite of nature.<sup>71</sup> This assumption was based on the self-evident validity of a natural order that has its ultimate foundation in the teleological idea of creation.<sup>72</sup>

The disappearance of a teleological grounding of aesthetics followed rapidly upon Kant. In its place there emerged a notion of radical subjectification, or the doctrine of the freedom of the genius from the horizons of rules. No longer subject to the comprehensive whole of the order of nature this artist is privileged to contrast reality and the raw prose of life. Here art—on the level of sense intuition—becomes the manifestation of the perfected concept of spirit. In the literal sense of the word art became for Schiller and Hegel an intuition of the world.<sup>73</sup>

Now Gadamer argues that "basing aesthetics on the subjectivity of the mind's powers was...the beginning of a dangerous process of subjectification."<sup>74</sup> Dangerous or not this was the "way" of aesthetics after Kant. Moreover, if we wish to understand the point of departure of Foucault's aesthetics, we must keep in mind that these earlier aesthetic horizons of Kant, Schiller, and Hegel—that inscribed a special significance to nature and works of art as the *organon* of a nonconceptual understanding of truth—are eclipsed in Foucault's lexicon by Nietzsche and to a lesser degree by Heidegger, and Bataille.<sup>75</sup> It is to Foucault's aesthetics we now turn.

## C. Aesthetics of the Self

Foucault suggested that such an aesthetic turn cannot be perceived or theorized by a philosophy still wedded to "transcendental" notions of reason, truth, and critique. Hence Foucault's (often misunderstood) critique of the Enlightenment humanism associated with Kant's first two *Critiques* that prevented discourse from moving beyond its subject-centered or anthropological origins.<sup>8</sup> This kind of humanism can be opposed Foucault thought by "the principle of a permanent critique and a permanent creation of ourselves in our autonomy: that is a principle that is at the heart of the historical consciousness that the Enlightenment has of itself."<sup>9</sup>

The consequence of Foucault's revisionist reading of Kant's third *Critique* is to aestheticize issues of politics, morality, and social justice to the point where they become a "transfiguring play of freedom with reality," an "aesthetic elaboration of the self," worked out by the Nietzschean strong individual in pursuit of desires, or in accordance with a private self-fashioning, that "ironic heroization of the present...which Baudelaire called art." In *nuce*, Foucault erected a Kantian ethics grounded in the maxims and postulates of enlightened practical reason to an ethics premised on the Nietzschean will to treat existence as "justified" to the extent we can view it as an "aesthetic phenomenon."

The important question now is does such an espousal of a private-aestheticist creed force Foucault to abandon the truth values of enlightened thought—of reason in its jointly epistemological and ethico-political modes? Does it compel Foucault to renounce any claim to promote and articulate the interests of autonomy, justice, and human emancipation? I suggest not. Rather it initially leads to the kind of self-delighting paradox or wished for *aporia* that figures so prominently in Foucault's thought. Later this "play" culminates in discourses, practices, and technologies of the self, where individuals create their own identities through ethics and forms of aesthetic self-constitution in order to attain a certain state of happiness and purity.

Foucault states that, henceforth, criticism will "not deduce from the form of what we are what it is impossible for us to know and do." Rather it will "separate out, from the contingency that has made us what we are, the possibility of no longer being, doing, or thinking what we are, do, or think."<sup>10</sup>

Initially, this sentence strikes one as a repudiation of Kantian thought. It appeared to support his claim that the only type of project that warrants his allegiance is an ethics/aesthetics of radical self-invention. Foucault's statement might promote this interpretation, but it also corresponds at every point to Kant's own claims in the original text "What Is Enlightenment?" Kant argued that we must think our way through and beyond these limits, those various forms of self-imposed tutelage or servitude as we exercise our powers of autonomous critical reason. If this is done autonomous judgement makes possible a critique that promotes human liberty. It also allows us to evaluate various orders of truth telling and to judge their ethical accountability in respect to their meaning, conditions, and goals.<sup>11</sup>

Perhaps, this explains how much was at stake in Foucault's historical studies of the origins of the human sciences and his critiques of structuralism and various (neo)Marxisms. He acknowledges the claims of certain moral imperatives. These imperatives *necessarily* hold whenever human liberty is endangered or compromised. Moreover, their validity cannot be relativized to this or that "phrase-regime," "discourse," or cultural "form of like" (*contra* Lyotard). Nor can this merely be a matter of one's private "perspective" (*contra* Lyotard and Rorty). For Foucault ethics is a matter of autonomous, freely willed choice arrived at after a laborious, critical study of historical evidence. On the basis of empirical evidence we make aesthetic judgements on the value of such evidence.

Thus, "the thread that connects Foucault to the Enlightenment is not faithfulness to its doctrinal elements, but rather the permanent reactivation of an attitude—that is of a philosophical *ethos* that could be described as a permanent critique of our historical era."<sup>12</sup> That is to say, in keeping with Kant's critical imperative Foucault required that philosophy take nothing on trust, its own "doctrinal elements" included. Instead we should persist in the kind permanent critique of self-questioning activity that allows no privileged exemptions, no truth claims (epistemic or ethical) that cannot be justified on reasoned or principled grounds. The primary function of the philosopher then is to analyze the present and to reveal its fractures and instabilities, the ways in which it once limits human liberty.

In brief, freedom is not understood as the liberation of some human essence that is locked up in what we essentially are or the even liberation of some repressed human essence. Freedom is a type of detachment or suspension of judgement that opens new possibilities for thought and action. It is new possibilities of thinking and acting, of giving new impetus to the undefined work of freedom—which is immediately bound up with an “aesthetics of existence” where it is imperative that we turn our lives into a work of art through self-mastery and ethical stylization.

Foucault as Kant *revivendus*? Yes and no. Foucault argued that the Enlightenment formulated a philosophical question that remains for us to consider and a philosophical attitude that requires implementation—namely an *ethos* of permanent critique. Such critique abjures the “blackmail of the Enlightenment”—that the acceptance that its reasoning discourses are a “final vocabulary” that progressively lead to wider and deeper modes of human emancipation. It is to this topic we now briefly turn.

#### D. Aesthetics, Ethics, and the Technologies of the Self

What do aesthetics, ethics, freedom, and purposiveness have to do with each other? In his last writings Foucault was drawn to the ancient philosophical notion of life as the art of living, as a style of life, as a way of life. He described this *ethos* as practices of the self, as the care of the self, and called it an “aesthetics of existence.”

Foucault taught that the only way we can be individuals is to create ourselves. He grounded his aesthetics (and ethics) on the idea of freedom. He argued that the inherently unknowable (or unreason) should be the foundation of aesthetics and ethics. Finally, he suggested that the key to understanding aesthetics and ethics is the concept of “purposiveness.”

He understood the ethics of the ancients as one of pleasure which is taken into the self.<sup>87</sup> Moreover, he saw in these practices of the self a conversion towards the self wherein one liberates oneself from externals, from sensual attachment to external objects and to the pleasures which these procure. Finally, he perceived in this lifestyle a self-mastery, self-possession, and a happiness in internal freedom and independence. Through moderation and regulation one cares for the self. Indeed, it is the responsibility of each individual to give style, beauty, and grace to his existence.

In brief, ethics is the relation the individual has with himself. The notion that ethics is immediately bound up with an aesthetics of existence is central to Foucault's understanding of freedom. For Foucault ethics is the deliberative component of free aesthetic activity and the basis for a prolonged practice of the self whereby one masters oneself in order to constitute one self as a free self. That is to say, freedom is associated with a mastery of the self and its desires. As such, the subject can turn his life into a work of art through self-mastery and ethical stylization. Such a transformation leads to a certain state of happiness, purity, perfection, or immortality.<sup>88</sup>

While Foucault does not uncritically affirm Greek culture, his unstated “normative assumption” was that Greco-Roman ethical practice is superior to later ancient and mediaeval Christian, and modern moral systems. First, subjectivity is not viewed as a reified construct of power. Secondly, the subject is no longer determined by a functionalist system of gratuitous power whose biopower trains bodies and regulates populations for no purpose other than its own intrinsic ends. Rather Greco-Roman ethics allow for the conditions of the possibility that a self-governing individual could create itself, and enjoy types of experience, pleasure, and desire in autonomous stylized forms which lead to a transformation of the self.

In brief, for Foucault ancient philosophy offered the opportunity to promote new forms of subjectivity to counter the normalized individuality which has been imposed on us for centuries.<sup>89</sup> The point is that contemporary philosophers can take up the Greek philosophy again “as an experience which took place once and with regard to which one can be completely free.”<sup>90</sup>

The specter of the isolated subject in contemporary thought is overcome through Foucault's aesthetical inquiries into ancient ethics and his valorization of a form of ethical practice that is non-universalizing, non-normalizing, attentive to individual differences, attentive to individual liberty, and the larger social context of the freedom of the self.<sup>91</sup>

Ethics here depends not so much on moral norms as free choice based upon aesthetic criteria which bracket the subjectivizing of the individual into a normalized, universal ethical subject. Foucault argued that the task of life is not to discover oneself but to continually produce a self as an autonomous subject.<sup>92</sup> That is to

say, freedom is understood as an ongoing ethical practice of self-mastery and care of the self.

Foucault argued that the subject is still discursively and socially conditioned, and still theorized as situated within power relations. The difference is now he sees that individuals also have the power to define their own identity, to master their body and desires, and to create a practice of freedom through "techniques of the self." Freedom is mastery of and power over oneself. As such, "liberty is the ontological condition of ethics and ethics as the deliberate form assumed by liberty."<sup>91</sup>

This study began with a specter that haunts contemporary thought: the specter of the isolated subject. Foucault proposed the overcoming of isolation through the study of how individuals in Greco-Roman culture handled problems such as "questioning their own conduct, watching over and giving shape to it, and shaping themselves as ethical subjects."<sup>92</sup> Foucault claims that "ethical freedom has to be practiced," that "ethics is the thoughtful practice of freedom," and that such self-mastery leads to an "aesthetics of existence."<sup>93</sup>

### V. Plotinus and Foucault

The effort to rethink the Greeks today consists not in valorizing Greek ethics as the moral domain par excellence that we need in order to think about ourselves but of doing it in such a way that European philosophy can start again from Greek philosophy as an experience once given, in relation to which we can be totally free.

Foucault, *Les Nouvelles littéraires*<sup>94</sup>

Although there are marked differences between the aesthetics of Plotinus and Foucault, and difficulties in Foucault's interpretation of ancient philosophical texts,<sup>95</sup> there exist, nonetheless, certain ideas each share with the other. First, there is

the recognition that aesthetics heal the disjointed, fractured self. Through art and aesthetics the individual overcomes isolation, dislocation, and rupture. Secondly, there is the claim that art and aesthetics are linked to truth, autonomy, and happiness. Thirdly, there is no discordance between art, aesthetics, and truth. Indeed, both appear more truthful than empirical truth, more rational than methodical reason, more valuable than normative principles of morality or utility.

The essential point for both is: cultivate yourself, create your own beautiful or sublime individuality, aestheticize your existence, craft an *ethos* that is good and honorable. Aesthetic and non-normative, sustained by personal choice and not by legal constraint, both Plotinus and Foucault propose relationships with the self that are differentiated, whose primary purpose is the "aestheticization" of the self. As such the power of philosophy is drawing up a design for an ethics of the individual, an ethics of freedom, which permits the self's overcoming of rupture, fragmentation, and isolation.

#### A. Art and Aesthetics: Rupture and Reconciliation

The ancient subject was not able to cultivate the soul apart from the metaphysical and mythical discourses which accompanied them. Plotinus proposed that whoever practices these aesthetic exercises accedes concretely to the universality of the *noetic* perspective, through a grasping of the presence of intelligible beauty.

The art of living in Plotinus' philosophy was grounded on a metaphysical "foundationalism." The emancipation of the individual has its *locus* in the domains of ethics and aesthetics. The individual achieves liberation through contemplative technologies of the self. These exercises make one aware of the undescended soul. Next, they permit one to grasp intelligibles, and indirectly the One through a variety of aesthetic symbols. Plotinus reflects on the ascent of the soul and the role art and aesthetics play in going beyond the self, at thinking and acting in union with universal reason. The best part of the self is ultimately a transcendent, "undescended" self wherein art and aesthetic perception reveals to the subject. Truth in grasping this eternal self, by discovering she has a reason in herself, the soul discovers she is a part of the universal reason which is within all humanity and the cosmos itself.

The contemporary self is able to practice the philosophical exercises of antiquity while separating them from the metaphysical

or mythical discourses which accompany them. Indeed, Foucault argues whoever practices these aesthetic exercises sees the world with new eyes. He discovers, in the enjoyment of the present a splendor of existence, which Nietzsche said allows us to say yes "not only to ourselves but to existence." Foucault describes with precision what he calls the practices of the self preached by Platonists, Epicureans, and Stoics in antiquity. He saw in this care of the self a cultivation of the body and soul which leads to a conversion towards the self, a possession of the self. In mastering this contingent self, by discovering it has a value in itself, the subject forges his spiritual identity as an autonomous being.

The art of living according to Foucault is not grounded in any "metaphysical foundationalism." Nonetheless, the emancipation of the individual depends upon a recognition of the many relationships the subject has with the self, or of the consciousness of the self. Moreover, the individual achieves liberation through "technologies of the self" which manifest themselves through a variety of symbols. It is here we encounter similarities between Plotinus and Foucault.

Subjectivity for both denotes relations to the self, and the critical function of philosophy is the elaboration of new "subjectivities" through the construction of "technologies of existence." Plotinus and Foucault propose a fundamental relationship of the self (subjectivity in its broadest meaning), ethics (determination of the principles of existence), and aesthetics (the individual's attempt to care for the self). The goal of life is caring for oneself by making one's life a work of art by designing one's life with the conviction that by caring for the self the individual renders the greatest service to humanity.

What Plotinus calls the ascent of the soul to intelligible beauty and what Foucault calls the practices of the self "in the ancients" corresponds to a movement of conversion towards the self: one liberates oneself from externals, attachments, and the pleasures one can procure. The difference between this "ancient" and this "postmodern," however, is that in Plotinus this movement of interiorization is inseparably linked to another movement in which one raises oneself to a higher psychic level, in which one remembers another type of exteriorization, another relationship with the exterior, another way of being-in-the-world which consists of being aware of the self as part of universal reason.

According to Plotinus, one identifies with an "Other" which is universal reason, and which is present in each of us. According to Foucault, however, one identifies with the "Self", which is freedom, which is present in each of us. As such, in Plotinus there is a radical transformation of "perspective" which has a universal and cosmic dimension which Foucault does not see. That is to say, "interiorization" for Plotinus is going beyond the self in a way which leads to universalization.

For Foucault there is nothing apart from "interiorization," a conversion toward the self which leads to a cultivation of the self.<sup>9</sup> The subject needs only recognition of the self to grasp the multiple forms the self can take to attain enlightenment and freedom. Indeed, for Foucault liberty becomes a certain form of relationship of the individual to the self. Hence his refusal to exteriorize: the...critical function of philosophy derives...from Socrates' imperative: 'Know thyself': that is, base yourself on freedom, through self-mastery."<sup>10</sup> Freedom is located in the individual fragment which is the contemporary self. It is not located in any universal totality beyond and within the self as argued by Plotinus.

#### B. Homo Aestheticus and Old Gods Ascending

Kierkegaard has noted:

Each age has its characteristic depravity. Our is perhaps not pleasure or indulgence or sensuality, but rather a dissolute contempt...for individual man."<sup>11</sup>

In their own times Plotinus and Foucault affirmed the self as soul and individual. Moreover, they argued that ethics are possible through the aesthetic cultivation of the self. This soul or self are not in the world as the limit of the world or exclusively as a subject that has *episteme* and *dianoia*. They are in the world as the unlimited of the world as a self that has *eupatheia* and *phronesis*.

In a contemporary world, Foucault argues that if moral experiences centered on the subject are no longer satisfying today because they have been uncovered as subjugation, then "we are confronted by a certain number of questions posed to us in the same terms used in antiquity."<sup>12</sup> Indeed, because "we no longer believe ethics to be based upon religion"...and..."we do not want any legal system to intervene in our private and personal lives," "our problem

today...is...somewhat similar" to what it was for the Greeks: how to base ethics on the rigorously personal choice of a style of existence.<sup>100</sup> A clear result from reading Foucault is that the achievement of wholeness and freedom in our age demands a return to the individuality of antiquity, and a retreat from subjectivity as moderns describe it.

In Plotinus (and Kant) the cohesion of the self rests upon transcendent (or transcendental) foundations. For Foucault cohesion rests on aesthetic interindividuality that abjures all types of transcendence provided either by a metaphysical reality or a transcendental normalizing intersubjectivity that would be humanity's shared lot.

We can now, perhaps, better understand, at the end of our story, what Foucault rejects in these enlightenment philosophies. But we can also better appreciate what he finds appealing in them. He locates freedom in the individual, he structures the quest for liberty in the arts and aesthetics. Contemporary existence can no longer be anything than an extension of the self as artist. The world is an aesthetic reality created by the subject, who is finally an autonomous, indeed ethical individual.

The ancient world considered ethics as an art which brings about in the community and the individual the order within which each individual finds the place and proportion due it. In brief, the goal of life is to achieve aristocratic excellence. This can only be achieved through the cultivation of the soul which is achieved through the care of the self. That is to say, autonomy lies in individuality, in the invention of a *homo aestheticus*. Since nothing is given and everything is constructed, ancient ethics and aesthetics provides the contemporary individual with the knowledge lacking to achieve autonomy, Foucault argues. Aesthetics also provides us with a means to overcome the prison of modernity, a way to emancipate ourselves from forgetfulness, fragmentation, and rupture.

Although Foucault argues we cannot go back and there is no *arche* that is free of all forgetting of concern for the self, explicit in his later works is an appreciation for the philosophy of the ancients. In this sense he has been central in the rehabilitation of ancient philosophy among contemporary philosophers. By his critical appropriation of themes in Plato, Seneca, Marcus Aurelius, Metrodorus, and Plotinus—Foucault has argued that our

"postmodern" condition, our existence in the world, is to be a creative individual. As such, it is necessary to return to the ancient sages in order to go beyond "modernism." His "postmodern" road begins in a *via antiqua*. For Foucault this is the only consistent basis for the new departure. Antiquity offers an ethics "through which the subject postulates the form he gives to his life."<sup>101</sup> It proposes aesthetics as a philosophical *ethos*.

For Foucault the need to lend a voice to the silence of the "Other" is a condition for enlightenment and freedom. His reading of the Plato and the ancients lead to a remarkable discovery. It was his autonomous self. This "self" is not just another entity in the world. In a fundamental sense this self creates worlds. Moreover, in knowing itself it comes to recognize other selves, and the "horizons" of any and every possible self. This acquisition of an "aesthetic pretense" is no innocent philosophical thesis. It is a weapon of enormous power. And it could not have been uncovered without the help of old gods ascending.

### Conclusion

This partial, yet it is hoped, representative survey of the aesthetics of Plotinus and Foucault, does not yield firm conclusions about the commensurability of their views of the arts and aesthetics. It does, however, suggest that their theories are not incommensurable. Therefore, it is possible to draw a few preliminary conclusions:

First, Plotinus and Foucault make extensive use of aesthetic symbols and techniques for overcoming the fallenness of the soul and rupture of the self. They affirm the concordance of art and truth. Art and aesthetics form an integral part of their strategies for the ascent of the soul and the technologies of the self. In addition they reject any associations of Plato, Platonism, and ancient philosophy with oppression, repression, and the loss of being. The ancient sages offer the possibility for an "aesthetic turn" which once taken culminates in the liberation of the self as *homo aestheticus* and the attainment of an "aesthetics of existence."

Secondly, art and aesthetics are valuable for the philosophical intentions of Plotinus and Foucault. Each stand as important and independent elements within larger programs for the ascent of the

soul and the liberation of the self. To view the aesthetics of Plotinus and Foucault from this perspective is to connect their theories of the arts with their proper philosophical context. Aesthetics is an affirming philosophical *ethos* that valorizes the individual, thereby vanquishing the darkness of forgetfulness, betrayal, and nihilism.

Thirdly, the aesthetic individual is the locus of value. Aesthetics so far as it springs from the desire to say something about the ultimate meaning of life argues that the absolute good cannot merely be a product of *logismos*. Self and value can be represented, perhaps better, as *aisthesis*. The self, the subject, and indeed subjectivity are best expressed in the words of Wittgenstein:

the 'whereof one cannot speak, thereof one must be silent.'<sup>102</sup>

#### NOTES

1. "Horizon" is the metaphor Nietzsche used in his celebrated "God is dead" passage: "How could we drink up the sea? Who gave us the sponge to wipe away the entire horizon." cf. *The Gay Science*, (New York: Vintage Books, 1974), p. 181 par. 125. It became a central philosophical concept in the phenomenological tradition associated with Husserl, Heidegger, Merleau-Ponty, and Gadamer. Here the term is used to call to attention what lies aesthetically in the backgrounds of Plotinus' view of the soul and Foucault's understanding of the self. The term also has a normative aura, for example when I speak of the aesthetic pretense underlying their respective visions of the soul and the individual. cf. R.J. Bernstein, *The New Constellation: The Ethical-Political Horizons of Modernity/Postmodernity*, (Cambridge MA: MIT Press, 1993), p. 10. N. 14. Hereafter cited as *NC* with page number in the text.

# Plotinus on the Origin and Place of Beauty in Thought about the World

A. Hilary Armstrong

This lecture is about the thought of Plotinus. That is, it is about the thought of one Greek philosopher, perhaps the greatest in a great tradition, the Platonist. He is perhaps the greatest because he is so original, and often differs on important points from other great teachers of the same tradition. The lecture is given by a person whose only claim to distinction is that he is a tolerably good expounder of Plotinus. It will be as well to begin by stating as clearly as possible what this means and implies.

I shall not be explaining or commending to you any sort of generalised "Platonism," still less any sort of "perennial philosophy" or "ancient wisdom." I have no sufficient historical evidence that this last exists. I do, however, recognise that there *are* important family resemblances between what all the true seekers and worshipers of that which is beyond all our thought and language, say to us, and I do not think we should depart from them, but take them and do our best with them as they come to us in one or more of many diverse forms, not, I think, without divine calling and ordering. And because of this I think that all of us are fundamentally on the same side. We seekers and worshipers have plenty of enemies, to whom we should not give aid and comfort by looking for more among ourselves. In particular I hold still more firmly than when I first thought of it to what I wrote at the end of an earlier essay on Plotinus and Beauty:

There is nothing more truly Hellenic in the philosophy of Plotinus than the way in which aesthetic and religious values, in spite of all his awareness of possibilities of conflict between them in our spiritual lives, are held firmly together in his thought about beauty. We may well be able to learn something from him here in our own age, in which an unnecessary and monstrous civil war between the defenders of different values has gravely weakened our civilisation and reduced its

capacity to resist the destructive domination of those whose only values are money and power. If we can re-Hellenise rather than de-Hellenise our thought in this respect, so that the love of beauty and the love of metaphysical truth are seen as parts of the love of God, the prospects for both religion and civilisation will be better. ["Beauty and the Discovery of Divinity in the Thought of Plotinus" in *Kephallion* (Van Gorcum, Assen, 1975) = *Plotinian and Christian Studies* XIX: p. 162.]

When I wrote this, my attention was mainly concentrated on the remarkable quarrelsomeness<sup>1</sup> of those who use the rather clumsy, prosaic conceptual and defining language of philosophers and theologians, which is only one among many human languages or ways of expression, to talk towards the unknowable source. But in a Temenos lecture it ought to be said that it applies particularly strongly, and was intended to apply, to the arrogant rationalist despising most philosophers and theologians of those who, like Plotinus, seek God also by the way of beauty. I do not think that the human intelligence is properly deployed, or that our rather inferior species is trying to move with the best in us towards our source, unless we give full equality and operative force to our other languages beside that of linear, defining and arranging reason: that is, to our languages of feeling and imagination generally expressed in the arts, and perhaps also to pure mathematics, which does not use words at all, but is also a very great human language, though somewhat difficult to classify philosophically, if that matters very much. We should do well to learn something from the Indian evaluation of reason, which is very much lower than the Greek. For the Indians what we usually call "reason" is on a level with, not superior to, our passions, desires and images, and may easily come to serve the purposes of other energies in us which, in the Greek view, it should dominate and guide. We should probably all benefit by reading a short, but very good and clear, exposition of the Indian tradition on what we usually call "reason", and what we usually call "religion". It is in a compilation by P.B. St-Hilaire of long quotations from the larger works of Sri Aurobindo.<sup>2</sup> In the case of both, Aurobindo's appreciation of the values of both reason and religion turns out to be highly positive, once their limitations are recognised. Plotinus, of course, has his own account of the divine intellect which is the source of both reason and religion, and the source of that intellect beyond our language and thought. And since

he is a Greek philosopher, he includes a good deal in his account of intellect which some of us might not wish to include and which we may or may not prefer to the Indian tradition.

I come before you as a common exegete of Plotinus, whom I think I have translated fairly well. I do not claim any authority, scholarly, philosophical, or revelatory, least of all that of any ancient or universal wisdom, which I am inclined to think does not exist. This claim to ancient wisdom, to the *Sophia Perennis*, of course is a Platonic claim, which can be traced back to the later ancient Platonists and was uncritically inherited from them by great Platonists like Ficino at the time of the Renaissance. But I do not make it because I belong to the group of scholars, who, among other things, in order to establish the true greatness of Plotinus as a Greek philosopher, set themselves to disentangle him from this revered or despised confusion of late antique wisdom, and to establish both his originality and his true and independent-minded following of the greatest classical Greek philosophers, above all of Plato. I do not, in any case, think it desirable to make claims of this sort. I have found that claims to represent an ancient, universal and traditional wisdom, which are generally historically dubious and disputable, have much the same effect as the notoriously incredible claims to a particular exclusive divine revelation made by conservative Abrahamic sects of Jews, Christians and Muslims. Nothing stimulates incredulity and indignation and touches off the ineradicable quarrelsomeness of those who are concerned with eternity so effectively as a good sweeping universal claim. I believe firmly in the eternal world and its source, and that there have been and are people who see further into it than most, and who deserve our reverence. I have spent my life studying one of them, and I think I may have known another. But even when I think that I am closest to Plotinus, I claim nothing for him except that he is a great Greek philosopher, and I do not claim for myself any understanding of the things he speaks about other than that dim awareness of the eternal and its source which he himself thought that all human beings share.

Before I begin my description of the thought of Plotinus about beauty it will be a good thing to say something about those of his writings which will be particularly helpful to those who want to understand that thought. It is always better to read Plotinus, even in translation, than to read any interpreter or expounder of his

thought. Much that is illuminating can be found in many places in his writings, but there are two treatises in particular in which he concentrates very much on that subject. The first is the early, rather too much read and translated I (1) 6 *On Beauty*. (An early treatise of Plotinus does not mean an immature or juvenile work, or one which he afterwards abandoned or on whose subject he changed or greatly developed his thought. He did not begin to write till he was nearly fifty, and all his written work was completed between about 253 A.D. and his death at the age of approximately sixty-five in 270. So all his writings are mature, and his thought in all essentials does not change or develop, though he is always revising and retouching, thinking things through again and answering objections that he or others have thought of. So he is by no means dull or repetitive). *On Beauty* is a fine treatise, but certainly should not be taken as containing all, or the finest, of the thought of Plotinus on the subject. It is absolutely necessary at least to read it closely with one of the greatest writings of Plotinus, the treatise *On The Intelligible Beauty* (V 8 (31)). This is one of the two central parts of the great work which Plotinus wrote to make clear the difference between Platonism as he understood it and the thought of some Gnostics who were frequenting his regular gatherings, and perhaps also other Oriental innovations, including mainstream Christianity. His editor Porphyry, who had his own editorial methods, broke up and rearranged this work. But it is very easy to reconstruct it from the chronological order of writing which Porphyry gives, and it should certainly be read as a continuous whole. (The order in the Ennead edition is III 8 (30), V 8 (31), V 5 (32) and II 9 (33).

The view of the universe which Plotinus gives is not simply another example of traditional wisdom. Like many ancient views of the universe he sees it as living as a whole, and whole as a living body, immensely varied and diverse in its organic unity. No one has ever written better than Plotinus about *Poikilia*, the richness of the diversity of a world which is none the less all one, held together in the unity of life. But the universe of Plotinus also has a peculiar sort of openness. There had been many suggestions in the Greek philosophical and other Mediterranean traditions that the source of the universe (often called God) is, or might be beyond and greater than anything which we could call by the best names we could think of, Intellect and Being. But as far as I can see it was Plotinus who, as the result of his long reflection on Plato and the already

centuries-old Platonic tradition<sup>3</sup> first formulated and fully expressed that this source is beyond our language and thought, over our frontiers. Therefore of course we cannot talk about it, in any language, and the best Neoplatonists all recommend silence at this point. But we all have to talk towards it, to run round and point, to make signs to awake ourselves and others to the immediate presence of that which we worship. So Plotinus has two preferred names for it, the One because he cannot find there that distinguishable difference which is the foundation of any thought and speech: and the Good, because the universe is simply its gift. All that we have and are is given without any reason or necessity except that it is good. For all Platonic good is essentially generosity. In formulating his thought (some, but not all of it traditional) about the source of the universe which is beyond our frontiers of thought and speech he created and bequeathed to all his true successors the Apophatic or negative theology. He effectively created, that is, that most disturbing way of thinking about God which shows the First, the source, to be beyond our thought and language but in some way very close to us. It was Plotinus who first brought into powerful and effective action that awareness which should, and sometimes does, trouble all our religious thinking of the source which is, for those who prefer to use the name, the God of our worship, but is never contained in or grasped by all our talk about God, by philosophers, theologians, poets or sages. If one tries to be a true follower of Plotinus, one will always be compelled to write unsuitably about the One, but will never do so without a sort of agony.

Plotinus insists that the One and Good is both infinitely absent from us, because it is nothing that even at our best we can think and talk about, and most intimately present, and present as giving everything. He says "For that One is not absent from any, and absent from all" (VI 9 (9) 4, 24-25). He also says "The Good is gentle and kindly and gracious and present to anyone when he wishes" (V 5 (32) 12, 33-35). Perhaps his thought is that the best way to become aware of that presence-in-absence is to see a light from beyond playing on the things we encounter, and to find a life in them which we are aware is given. Light and life are the signs of presence. And though they are neither Beauty nor the One it is they which make everything true and good, and therefore the whole Platonic World of Forms or Ideas, beautiful, that is delightful and

enjoyable, for Plotinus. Though for him True, Good and Beautiful are only three words for one thing, that flowering of the One into the One-Being, the World of Forms or Divine Intellect, to which we shall shortly come. But before we do, I must give a brief explanation. This is that I have never read or learnt from anyone familiar either with Plotinus or with the Platonic tradition in a broad sense that Platonic transcendence meant anything else than that which I have been trying to indicate. The source is far beyond the limitations and divisions of space and time which the eternal World of Forms itself transcends. There is nothing "vertical" about the source, literally or metaphorically. It is not in the depths any more than in the heights. It is beyond light and dark, and whatever else we may associate symbolically with light and dark. It is simply there, as much in our world of experience as anywhere else, and also absent from it because it is nothing else which we experience. I have never meant anything by "transcendence" but this absent presence. There is some reason for associating "vertical" transcendence with Plato, especially in his later years, when he saw the power of divine intellect in this world particularly manifest in the visible heavens. I have written something on this, and on Plotinus's very tempered acceptance of it, elsewhere,<sup>4</sup> in dependence on my friend Frederic Schroeder, who has recently written one of the very best books for understanding the philosophy of Plotinus.<sup>5</sup> But this is not genuine Platonic transcendence.

I should like to conclude this part of my paper, and prepare the way for the next part, by quoting one of Plotinus's own summaries, which, as usual, are considerably better than attempts by other people to sum up his thought in, inevitably, less suitable words:

All these things are the One and not the One: they are he because they come from him; they are not he, because it is in abiding by himself that he gives them. It is then like a long life stretched out at length; each part is different from that which comes next in order, but the whole is continuous with itself, but with one part differentiated from another, and the earlier does not perish in the later. (V 2 (11) 2, 24-29).

The next part of my talk will be about the universe which is itself gift of the source and in which all giving takes place. It is as parts of the universe and in the universe that we are aware of the Good as Good, that is as giving our selves and all that we have and are. There is an eternal moment in Plotinus when the One-in-Many,

so to speak, flowers upon the One in its simplicity.<sup>6</sup> This is both Divine Intellect and World of Forms or Platonic Ideas, not as two entities one contemplating the other, and one only by the one contemplating the other, but absolutely one, all awake and alive in the inseparable unity of a vast diversity. In this insistence on the unity of Forms and Intellect Plotinus is, as far as I can see, absolutely original in the Platonic tradition. With the One-Many or One-Being eternity begins: indeed it is itself eternity. And we live in eternity, though also in the timed and spaced life which begins at a lower level and we are not generally conscious of eternity: this is not of the first importance to Plotinus. For we are *Psychai*, which we inadequately translate "souls", and *Psyche* is an outgoing inhabitant of *Nous*, the One-in-many or One-Being. With the One-in-many it may seem that the main objection to descriptive and defining speech or thought has been removed, for the absolute absence of number and differentiation which makes speech or thought about the source, the One or Good, impossible, has gone. But things are not as simple as that. The unity of the One-Being is still too great for speech. In fact there is no speech or language on that level at all. Everything in that world is and possesses everything. Every part is unimpededly the whole in eternity, and the whole is every part. So it is likely to be a world of intercommunicating silences and luminous transparency.

Not only Plotinus, but all the later Neoplatonists<sup>7</sup> agreed that ordinary philosophical language, the language of discursive, deducing and defining reason, stops short of the One-Being. We must of course talk towards it with what languages we have, which meant for Platonic philosophers the language of later Greek philosophy. This of course was not the narrowly specialised and segregated language of modern philosophical prose. It had plenty of room for image and metaphor: and Plato and Plotinus, especially, cannot be boiled down to their logical arguments without losing a great deal, including everything which has given them such wide-ranging influence. But this does not mean that even Plotinus, and more still some of his successors, above all Proclus, do not push discursive reason a good deal further than on their own assumptions it ought to go, and often seem to be in serious danger of giving a systematic description of the eternal. Plotinus, however, strongly prefers non-discursive, imaged language in speaking of it. This is

apparent in his famous chapter on Egyptian hieroglyphics (V 8 (31), 6). And he says, among a good deal else in V 8 (31):

One must not then suppose that the gods or the 'exceedingly blessed spectators' in the higher world contemplate propositions, but all the Forms we speak about are beautiful images in that world, of the kind which someone imagined to exist in the soul of the wise man, images not painted but real. (V 8 (31).5. 20-24).

Plotinus seems to have had a particular dislike of people who saw the Platonic World of Forms as a system of abstract propositions. But in a later chapter of the same work he takes vigorous issue with Platonists who took those images too literally, as entities contemplated externally. None of our languages, discursive or non-discursive, can do justice to the contained inward unity-in-diversity of the eternal One-Many (V 5 (32) 1). We must do the best we can with what we have. But the inadequacy of all human languages, of poetry or painting or music as well as that of philosophy, must always be remembered when reading Plotinus, though it is very easy to forget it, and even Plotinus does so sometimes. There are a few who see clearly, like Plotinus himself at times, that beauty of truth and goodness which is all reality and of which the world of our everyday experience, in which our thoughts and languages are based, is an image, inadequate to the reality which exceeds us, but the best and only one we have: and our little function, in the little part of our immensely diverse world which we temporarily inhabit, is to help to make it as good an image as possible, a holy Icon carrying to us something of the light and life which begins in the One and flowers in the One-Many.

The One-Many, which is at once the Platonic World of Forms and the Divine Mind, is all the original reality there is, deriving from and receiving the eternal gift of the One. It is the teaching of Plotinus that the One-Many in its eternal existence spontaneously and immediately generates an image. This is a natural image, like a shadow or reflection, not a contrived and planned self-portrait. It is necessarily inferior to its archetype, but is what we here and now have to deal with, and it is our duty and our pleasure to, in our small and limited activities, carry the Good, which is also Truth and Beauty, to the furthest limit which is possible in it, and to wake up as many people as possible to some gleam of its light.

This we do, if we wake up to what we are, as individual *Psychai*, parts and also, as always in Plotinus with immaterial or spiritual beings, the whole, if we realise it, of the great universal *Psyche* which is, as I have said, the outgoing inhabitant of the One-Many which forms, orders and in the greatest of its parts, the World-Soul, animates our image-world. It is important in reading Plotinus to understand that he never felt quite comfortable with the sharp distinction between *Psyche* and *Nous*, the Divine Mind, which he, like all later Platonists, accepted. This distinction comes from Aristotle rather than Plato.<sup>4</sup> Plotinus often speaks of *Psyche* in a perfectly correct and conventional way as the third level in his hierarchy of One, *Nous* and *Psyche*. But he overcomes any tendency to overmuch distinction and consequent disjunction by his characteristic move of self-transcendence. When a *Psyche* is above its hierarchical level and is truly an inhabitant of the One-Many, while not ceasing to be *Psyche*, it is most truly itself. Further, the outgoing of *Psyche* to the image-world makes it share in an unique sense in the generosity of the Good, which is the driving-force of the whole thought of Plotinus. Without *Psyche* the One-Many, the One-Being, would perhaps seem a little too inturned, a little self-complacent in the contemplation of its beauty from which all else springs. But it is the function of *Psyche*, and of ourselves as individual *Psyche*, to carry the light coming from the Good which makes beautiful the truth and goodness of the One-Many to the utmost limits of possibility in the image-world, to everywhere where any gleam of truth, goodness and beauty may be latent and made more apparent.

We should remember at this point that true Platonic transcendence does not mean that the Good and the World of Forms are abstract or remote. They are immediately present, here and now, in the image-world in which the outgoing *Psyche* operates as being and not being the Good giving itself to the limit. They are no more "in the heights" than "in the depths," though experiences which we shall naturally image as experiences of height or depth will play their part in waking us up to an awareness of their presence. It is the constant conviction of Plotinus that very few will become fully awake and aware. Most of us will remain pretty somnolent, embedded in our illusions of success and exploitation in the image-world. But by hearing, reading, seeing or even in very rare cases meeting someone who has fully woken up, some gleams of their

light may remain with us and be transmissible. And even a dim awareness may impose an obligation.

All Platonists concentrate their attention on the moral Forms, the Forms which guide and dictate morally good action in this world. And no study of Plotinus or of the later Neoplatonists should lead to a sectarian narrowing of the sphere of moral action. The Forms are active in dark as well as light, in shadow as well as in often complacent illumination, and we must each of us find our own way to right action and not waste time quarreling with those who find other ways. Moral Forms are not moral rules. Perhaps the ideal human being for Plotinus is one in whom the moral Forms are so alive, and he is so awake to them, that he always does simply what is right regardless of the consequences. This is not exactly a recipe for success in the modern world. People who follow it are very rare, and likely to die poor and with a reputation for nothing but oddity. But their neighbours may go on praying at their graves long after they are dead.

Perhaps those who are concerned, like *Temenos*, with the place of the imagination and the honour which it ought to receive, and does not, in our world, should give some thought to the conviction of Plotinus that to make people genuinely aware of Beauty is to make them aware of the immediate presence of the whole World of Forms. Truth, Beauty and Goodness are three names for one unity which is made effectively beautiful, that is, lovable, by the light and life which come to it from the Good. We need to overcome the false distinctions between the love of truth, the love of moral goodness, and the love of beauty, which have so confused the modern world. In particular we need to overcome the strange belief that goodness is not beautiful. I am afraid some Christians are largely responsible for this. They seem to have little love for truth outside their own narrow limits, and they almost seem anxious to associate ugliness, or at any rate dullness, with moral goodness.

The function of the arts in the image-world according to Plotinus is evocatory or incantatory. It is to bring to as many as possible an awareness of the World of Forms by using those very powerful images which they command. They can do this excellently, he says, not only by enhancing the beauties of nature but sometimes by improving on them in their own works, for artists of all sorts have direct access to the one world from which the images of nature come (V 8 (31), 1: see my note in Loeb V pp.

240-1 on the difference from Plato). Each of those who practice any art must find their own way of doing this, according to their means of expression. But if they succeed in making people more aware of the World of Forms and its source, the Good, by any imaginative means; and if they succeed in waking people, even a little, to the presence of the light from beyond our frontiers; they will be successful in a Plotinian sense, even if they are not very fashionable, and so successful in terms of money and temporary influence, in the modern environment.

I should make it clear that this waking of people to awareness of the light is not at all a "religious" activity in our modern understanding of religion. But to Plotinus it was the supreme religious activity. The world of Plotinus, including his immediate circle, was permeated by religion. Everyone practiced the traditional holy rites, directed to the divine and its source, who felt any sort of need of them. Plotinus did not. But his closest collaborator in the circle, Amelius, did. And it would be a mistake to see him, because he followed his personal vocation, as any sort of post-Christian anti-clerical or anti-religious person. The Neoplatonists after him were often very externally devout pagans for some three centuries; and both during and after that period have generally been sufficiently externally devout Christians and Jews, and, later, Muslims. I am afraid that it is the Christians who must take the main responsibility for the change in the attitude to religion between the age of Plotinus and our own. It is the enthusiastic imposition on us by the Roman Emperors and their successor governments of one form or another of an intolerant Abrahamic exclusive monotheism which has at last brought largely justified revolt and led most people to see "religion" as a dull, ugly, quarrelsome sub-department of life rather than the waking to the love of Beauty and its source, which can demand greater sacrifices than the fashionable cult of money and success.

I hope this lecture has shown that a good way of discovering what is still living in ancient tradition is the close study of one of the greatest of Greek philosophers, even going at times into the "minute particulars" of his thought. Plotinus would have claimed to be a philosopher (which I do not), but he would have made no other claims, though he would have accepted an obligation to communicate what was awake and alive in him to all who cared to attend. And, because he spoke and wrote as a philosopher, he knew

that he was communicating into a conversation. Perhaps the insistence of the Platonist philosophers that their language, though inadequate, was the best that could be used for speaking about reality and its source was due to this sense of continuing conversation. There had been going on, at least since Socrates, a continuous, at its best courteous, conversation between equals, which one must enter if one is to speak as a philosopher. This conversation is not limited to one specialized sort of language, but must broaden and adapt itself according to the demands of the subject. It had its roots in Socrates's deep diffidence about all human knowledge, especially of the divine. It had always been critical, and, when it was good philosophical conversation, self-critical. And a Platonist will be inclined to think that as the conversation continues it will become more and more healthily sceptical, in the ancient sense which does not deny the existence of anything, but is very doubtful about the certainty of our knowledge of anything. As the conversation goes on, those who take part will increasingly question not only themselves but their authorities and assumptions. There will be no accepted reserved areas, neither revelations nor poetry nor the utterances of saints and sages. There is nothing and nobody with which it is not permissible to disagree.

A Platonist will also remember that it was Plato's own school, the Academy, which first formulated, and was for a couple of centuries dominated by, the most flexible and perhaps the most lastingly influential form of ancient scepticism, the Academic. It is not impossible, though it is not likely that there will ever by any completely convincing evidence, that the thought of Plotinus about Beauty and its source was, at its most radical, influenced by Academic thought. If so, this discussion may have been useful because it links Plotinus with his claimed beginning, with that Platonic portrait of Socrates which makes him for all Platonists the archetypal image of a philosopher who did not claim to know too much about the Good.

# **Does Modern Art Reflect Plotinus' Notion of Beauty?**

**Aphrodite Alexandrakis**

Through the ages, art has taken on many different forms as civilizations have attempted to represent and accommodate their particular cultures through specific art styles. These styles range from those of prehistoric art to those of the twentieth century. In reviewing this variety of styles and the media that these styles encompass, one cannot escape an analysis of beauty and its relationship to this wide range of styles. The question of beauty, of course, is a question that has occupied philosophers' thought since Pythagoras' time.

Twentieth century art, particularly art of the 1980s and 1990s in all its forms, has been criticized by the public and by professionals for its abstract nature and its abandonment of meaning, symbolism, and even a representative style. Modern art has also been criticized for neglecting society's values, emotions, and general needs. This criticism, however, is nothing new: the public has complained about art for ages. During the high classical period, for example, Pheidias' sculpture of Athena Parthenos was criticized by the Athenian public, and Plato accused Zeuxis for painting too realistically.

Ancient art, and the art of the past in general, was traditionally evaluated on the basis of the correct placement of each element within the composition. This placement results in a lively, "correct," realistic representation, with the addition, occasionally, of symbolism. The art work is seen as being composed of certain consciously employed elements, such as lines, shapes, and colors. These elements are distributed in a symmetric and rhythmical fashion which results in the unity of the whole, i.e., beauty. This unified whole with its interrelated parts reflects harmony and rhythm, and its end-product is a harmonious whole.

Both Plato and Aristotle conceived of these elements as being most important in works of art. It is widely held that Plotinus

disagreed with this. I believe that the notion of beauty in some twentieth century art works is similar to Plotinus' notion of beauty. On the one hand, the simple, abstract form of modern art's style conforms to Plotinus' refutation of symmetry as the cause of beauty. On the other hand, due to the non-uniformity of the styles and media used in modern art, it can be argued that some modern art works, including modern music, reflect Plotinus' notion of beauty as the representation of Idea.

The main purpose of this paper is to discuss the plausibility of a link between Plotinus' notion of beauty and the twentieth century artistic conception of beauty. First, I will briefly discuss the Platonic formal elements in order to distinguish between Plato's and Plotinus' positions on this issue. Second, I will compare Plotinus' notion of beauty and the role of the formal elements to Plato's thesis. Next, I will discuss Plotinus' theory of symmetry in connection with the formal elements of beauty in order to bring attention to some problems involved in the theory. Finally, I will apply Plotinus' notion of beauty understood as the representation of the Idea through physical matter, to specific modern works of art.

In defense of the formal elements' contribution to beauty, Plato stated:

The principle of goodness has reduced itself to the law of beauty. For measure and proportion, always pass into beauty and excellence. For when I say beauty of form...I mean...the straight line and the circle and the plane and solid figures formed from these by turning lathes and rulers and patterns of angles...<sup>2</sup>

Even though Plato criticized the arts, he held that the beauty of art depends on, and is found in the formal elements: the σχῆμα or περιγραφή.<sup>3</sup> He emphasized the beauty of pure form or σχῆμα. But pure form consists of several formal elements such as symmetry, order and harmony (*Laws* 669). Socrates repeatedly emphasized the importance of the formal elements by saying that:

...Any compound, whatever it be, that does not by some means or other exhibit measure and proportion, is the ruin both of its ingredients and, first and foremost, of itself...for the qualities of measure and proportion invariably,...constitute beauty and excellence.<sup>4</sup>

Plato's admiration of, and belief in, the formal elements' essential role in beauty is highlighted in several of his other books. First, you perceive the formal elements, then you come to love them, and then you recognize beauty because you have become capable of reasoning. When Plato refers to music education (*Rep.* 401c), he again emphasizes the important role that the formal elements play in a work of art. True beauty springs out of harmony, rhythm, and melody. Rhythm is the result of the symmetric repetition of the elements within the composition (in music, painting, drama, or sculpture). The same is true for melody, and the other formal elements. They are not simple, single entities as Plotinus thought them to be. In contrast to Plato, Hegel reminds us that the Plotinian position was that:

...the beauty of art is the beauty that is born-born again, that is-of the mind...for such a fancy must at least be characterized by intellectual being and by freedom.<sup>5</sup>

Hence, Plotinus held that beauty is found in, and springs out of the soul. But for him this is a process of learning. We discover beauty when we learn how to look within ourselves since this is where beauty and the spiritual world lie.<sup>6</sup> Thus, Plotinus claims that the artist creates by having access to, and being in contact with the intelligible world. The artist should not copy the sensible world because then he would simply be reproducing another image. "The true function of art is 'heuristic'; through the work of art we discover, or 'invent,' the eternal model, the idea of which sensible reality is a mere image." Art ought to relate to the eternal models of the intelligible realm which preexist human cognition. What art ought to do is "invent" a way to represent the eternal model. The true artist must therefore imitate the Idea, not the sensible world. During the creative process of imitating the Idea, he searches for and discovers himself, his soul, his spiritual nature. It is in his soul where beauty resides, and when he discovers his soul he gets to know both himself and beauty. Accordingly, he advises us to:

Go back into yourself and look; and if you do not see yourself beautiful, then, just as someone making a statue which has to be beautiful cuts away here and polishes there and makes one part smooth and clears another till he has given his statue a beautiful face, so you too must cut away excess and straighten the crooked and clear the dark

and make it bright, and never stop 'working on your statue' till the divine glory of virtue shines out on you, till you see 'self-mastery enthroned upon its holy seat.'<sup>8</sup>

During this process, which is a process of purification, the self has abandoned everything that is of a sensible nature. The self is found on a purely spiritual level, for it has ascended to the first principles. This is what happens during the authentic artistic process. The Plotinian artist, while in contemplation, "perceives" what beauty is, when he has rendered his own soul beautiful, and discovers the beauty within himself. When this happens, he has reached the know-thyself stage, and is ready to embody, to give form (*εἶδος*) to the Idea. In other words, through the artistic process the artist attempts to transform his medium into his contemplated vision. The Idea comes from the nous (*νοῦς*) and when he is finished, both the artist and his creation become one and his soul sees the divine light. This means that during the artistic process, the artist also becomes one with an eternal Idea or a vision of the divine. Consequently, the notion of art for Plotinus, is not merely "making something" (e.g. a statue), but as inherently purifying and pedagogical.<sup>9</sup> The sensible world for Plotinus is therefore not distant and irrelevant to the artist's creation. It is actually the sensible world that reminds him of the existing spiritual world within himself. Plotinus explains:

For how could there be a musician who sees the melody in the intelligible world and will not be stirred when he hears the melody in sensible sounds? Or how could there be anyone in geometry and numbers who will not be pleased when he sees right relation, proportion and order with his eyes?<sup>10</sup>

The artist's vision goes beyond the appearance of sensible things to discover their form. What he creates is the result of his contemplation of the idea, the form for:

...What is the source of the beauty of Aphrodite herself, or of any other beautiful human being or of any god of those who appear visibly...Is not this beauty everywhere form, which comes from the maker upon that which he has brought into being...<sup>11</sup>

Plotinus points out that in order for the artist to reach a position of reflecting upon the idea and to concentrate and go deep down to

search within himself, he must first understand the distinction between the physical universe and everything that it includes. Then, he must concentrate to imagine the massless, sizeless spiritual world. As was his standard practice, Plotinus here develops a step-by-step process, or dialectic, which the artist experiences in order to be able to create. Thus, beauty and art come from *nous*. Art is an expression of beauty from within. The form is in the artist's mind (*Ennead* V.8.1), and through his medium (matter) he gives a physical form to the image of his vision. He says:

The stone which has been brought to beauty of form by art will appear beautiful not because it is a stone-for then the other would be just as beautiful-but as a result of the form which art has put into it. Now the material did not have this form, but it was in the man who had it in his mind even before it came into the stone; but it was in the craftsman, not in so far as he had hands and eyes, but because he had some share of art.<sup>12</sup>

Plotinus' statement corresponds to many of the presuppositions of twentieth century art. Art is conceived in our time as the embodiment of the artist's inner idea, that is, the artist's inner expression of a special "feeling" whose source is the recognition of the eternal principles. Art is consequently a mimesis, an imitation of the idea in *nous* through use of a material medium. It is indeed the idea and the process that takes place in the artist's mind (*νοῦς*) that is important today in artistic creation since most of today's art works are not commissioned as was the case in the past. This means that representation and the sensual world are not important to the artist. The artist is not just copying another sensual image. Modern paintings such as those of Rothko or Newman for example, may illustrate the Plotinian notion of art.<sup>13</sup> These paintings were created as a result of the artist's having "some share of art" (*Ennead* V.8.1), that is the artist's inner idea. The *εἶδος* (form) here is externalized through the simple appearance of colors. Additionally, the fact that the painted surface does not consist of any formal elements yielding a symmetric whole is also Plotinian. The painted canvas is the embodied imitation of the idea found in the artist's mind in an abstract style. His abstract style is an ordered and intellectually controlled abstraction. Rothko's paintings show the Plotinian perception of art's internal meanings. His works are bare and inert

with an audacious emptiness. However, what we sense is his idea of emptiness that is expressed in an internalized sensation of a dominant color. The colors that Rothko uses dematerialize the art object and result in an atmospheric and illusionist abstraction with an ambiguous spatial depth. The non-symmetric whole of the composition is another factor in this style of paintings that is compatible with Plotinus' theory. What is important is the imitation of the idea found in the artist's mind. In fact, from the Plotinian point of view this is so important that if Plotinus were asked whether the natural rainbow is more beautiful than a painted one, his answer would be that the painted rainbow is more beautiful because "...the arts do not simply imitate what they see, but they run back up to the forming principles from which nature derives."<sup>14</sup> Therefore, the source of artistic beauty is nous (νοῦς) for, as he says "The rational principle in soul is more beautiful than that in nature."<sup>15</sup>

At this point, a distinction should be made between a) beauty as form and as the cause or source of all beauty in art, and b) the beauty which may be attributed to art works in so far as they are images of form(s). Consequently, while modern art may appear merely expressive of a feeling to casual observers through a particular abstract patch of color, there truly are cognitive and intelligently controlled mental processes at work in the artist's mind which he is using to convey or represent a certain style (for example, cubistic, expressionistic, etc.). Thus, the style of the art work is not the determiner of its aesthetic value or purpose (i.e. beauty), but the intelligible process or "form", the idea, of which it is a representation or image.

As shown, Plotinus refers to and emphasizes the notion of beauty as form (εἶδος),<sup>16</sup> having no parts. But what is form? Does not form suggest structure, that is, order? Plotinus thinks of form as an Idea whose notion is abstract, having no structure, no order. But if we think of the beauty (or form, εἶδος) of Aphrodite, as Plotinus mentions in *Ennead* V.8.2, then we may question whether that type of form suggests structure or order. Even an abstract idea is perceived as having a certain structure, because without a structure it would not have a particular form in one's mind as an idea. How can one refer to beauty without thinking of what constitutes it? How can we think of beauty without detecting within its form a certain order or structure? How can a structureless idea

exist, and how can such an idea be rational? Rationality consists of order and structure. Plotinus, naturally, was aware of all these difficulties. For him, an idea does not itself "have" a certain structure, but it *suggests* structure or order in the sense that an idea implies that an *image* of it will be structured in a certain way. The reason Plotinus refers to form or beauty as an abstract entity is because of his theory of symmetry.<sup>17</sup> Beauty, for him, is not caused by symmetry. Symmetry is the effect of beauty. He distinguishes form (the whole) from symmetry. Symmetry consists of, and presupposes parts; therefore it is a composite entity. Normally, we understand symmetry as suggesting the beauty of the whole, whose parts may not necessarily be beautiful themselves. Plotinus does not accept this. He thinks that if the whole is beautiful it cannot be composed of ugly parts (*Ennead* I.6.1), and that "Beauty in an aggregate demands beauty in details..."<sup>18</sup> As Professor Anton has shown, Plotinus is convinced that there exist objects that are simple, single, non-composite and beautiful by themselves. This, of course, is in accordance with Plotinus' metaphysical theory of the One as being a single, non-composite entity, the "beauty beyond beauty" (κάλλος ὑπὲρ κάλλος), and therefore without parts. However, when Plotinus applies the terms simple and single to physical objects in order to determine the nature of their beauty, various problems arise. For one may ask: Are the objects Plotinus refers to simple and single? Let us examine this question for a moment.

In offering these types of examples, Plotinus refers to beautiful single and simple things such as the light of the sun, the stars, beautiful colors, a single sound, and even a block of gold. Each of Plotinus' examples fits very well with today's modern conception of art. The light of the sun is used today by artists in various contexts as being a simple unit of beauty. A gold metal block could potentially be used as a work of art all by itself. This is the result of the Plotinian conception of art and beauty which, as pointed out, is in agreement with much of modern art's spirit. While, as we saw, there is a correspondence between the Plotinian idea of art and twentieth century art works, there is a problem with Plotinus' theory in the above examples. Plotinus holds that entities such as lightning, sunlight, and gold are simple and single. The question is, in what respect are these entities simple and single? Physics has shown that these are complex physical entities that are physically

analyzable. Stars, colors, lightning, sunlight, and gold are all composite entities. A star consists of parts such as electrons and quarks. The star's beauty as we see it from the earth at night depends on the number of electrons and quarks that it contains. Even though these parts cannot be seen nor detected by the naked eye, they are arranged in a specific order. The star is therefore neither a simple nor a single entity. Additionally, it has order and symmetry in its parts. It is the combination of all these elements that reflect the star's beauty as we see it from the earth. Moreover, Plotinus' claim that the parts of a beautiful whole must be beautiful does not hold here, for protons and quarks by themselves are not beautiful in any sense.

To pursue the matter further, let us consider another of Plotinus' examples as being simple and single: the effect of lightning. The effect of lightning in the sky is not the result of a single or simple entity, nor is sunlight. The beautiful blue color of the sky is due to the interaction of the atmosphere's particles with the blue waves of the white light. The blue waves are scattered more than any other color of the spectrum, thus giving the sky's blue color. The same happens during sunset when we see the red color in the sky. While the particles in the atmosphere are occupied with the deflection of the light, the color waves that are free and dominate the atmosphere during sunset are the red color waves, which cause us to see the red color in the sky.

Similarly, Plotinus' example of gold as being a simple and single entity does not help his argument either. Gold consists of an orderly, structured composition of electrons. Contrary to what Plotinus says, if a piece of golden jewelry is compared to a plain piece of gold metal, the latter's beauty will be of a higher degree than the former's. This is because in the case of the jewelry, there is an additional orderly structure and proportion. This kind of structure results in symmetry, and symmetry, contrary to Plotinus' theory, is the cause of its beauty and not vice versa. It becomes obvious that all the entities to which Plotinus refers in giving his own definition of beauty by trying to follow his metaphysical system, are neither simple nor single. Plotinus was not aware, of course, of the scientific structure of all these entities and therefore the assumptions on the basis of which he forms his theory of symmetry, are not concrete. While he rejects the idea of beauty caused by symmetry, he holds instead, that symmetry is the effect

of beauty. But as shown, even in a "simple" entity such as a piece of gold, there has to exist some order, balance of the elements that constitute the gold in order for the end-product (effect) to be beautiful.

On the one hand, Plotinus holds that the artistic form is a single idea, having no parts: it is beauty as such, and does not depend on symmetry. On the other hand, he begins *Ennead* I.6. by stating that beauty is visual, but he addresses himself to hearing as well, which refers to the beauty found in the melody and rhythms of music. He seems to equate his conception of beauty as being single and simple to melody and rhythm as being simple entities themselves therefore having no parts. But are the concepts of melody and rhythm really single and simple? But is this really correct? It is interesting to note that even though Plotinus criticizes symmetry, in *Ennead* II.9.16, 39-44<sup>19</sup>, he praises melody, proportion, and order. But as shown, these are composite, complex elements of a symmetric structure. This quotation is in one sense Platonic, and in another sense, Plotinian. It is Platonic for he praises the formal elements of relations, melody, and proportion. Its Plotinian nature is found in the appreciation of the sensible sounds that reflect the human element, namely emotions. It does, however, sound contrary to Plotinus' own theory of symmetry's refutation. It seems that although Plotinus rejects symmetry as being the cause of beauty and therefore at times ignores the formal elements, on the other hand whenever he thinks it necessary, as in this case, he praises proportion and order as reflecting beauty.

Plotinus knew that as far as music is concerned, it would be impossible to disregard the essential role of the formal elements in its structure. His conception of the formal elements in music is therefore close to Edward Hanslick's twentieth century theory of music. According to Hanslick, in music we contemplate the sounds and the forms created by their movement, namely, the melody, the harmony, the rhythm, and the instrumentation. In addition, Hanslick, in a Plotinian fashion refers to these elements as being in the composer's mind, which is equivalent to the Plotinian inner idea. But is the idea in the artist's mind simple and single as Plotinus claims, and what does this mean? Hanslick points out that music is made of a "system of tones, with their latent possibilities for melodic, harmonic, rhythmic variety." By tones he means "the degree of the major and minor scales, with all their intervals and

relationships..."<sup>20</sup> All these are in the artist's mind, according to Hanslick. This idea is compatible with Plotinus' theory that the artistic work is the product of the idea in the artist's mind. But is the idea simple and single as Plotinus says? Apparently not. Suppose an artist has the idea (or form) of rain in his mind, and on the basis of this idea creates some object that is artistic. In what respect is the form, or idea, of rain simple? The idea of rain cannot be regarded as being a simple idea. It is composed of a form without which it would not have been an idea, and as shown, a form has structure.

When the artist embodies his idea in a work of art, a musical piece for example, if it has been created successfully, then it will be beautiful, that is, it will have beautiful melody for a good reason. The reason is that there exists an organization of sound, and a rhythmic structure of the composition. These are the formal patterns of music. In listening to a piece of music, we derive satisfaction from following and anticipating the movement of the sounds from the formal pattern of music. All these, however, not only involve the concept of symmetry, but also suggest that Plotinus' thesis that symmetry is only the result of beauty is incorrect. It seems to me that the opposite is true. Beauty is the result of symmetry. But since Plotinus is against this idea, it sounds odd for him to ask: "how could there be any one skilled in geometry and numbers who will not be pleased when he sees right relation, proportion and order with his eyes?" It is the right relation, proportion and order that constitute symmetry, and this reflects beauty which in turn, causes the special pleasure we feel.

To conclude, let us go back to the central question of this paper. Is there a link between Plotinus' notion of beauty and the twentieth century conception of beauty in art? Plotinus' notion of beauty as an idea in the artist's mind and void of symmetry, corresponds to the works of a large number of twentieth century artists, one of which is Rothko. The reason for this is that Rothko's compositions do not depend on the effect of the proper combination of the formal elements, so symmetry does not result in beauty. (Perhaps this is why viewers disagree on whether these works are beautiful.) The art work is the result of an idea in the artist's mind (*nous*), and is externalized without imitating the sensual world. Only the idea (in *nous*) is important, not the subject matter. In both, Plotinian and contemporary art, there must always be some sort of relation that is

controlled by the artist, no matter how "merely abstract" or "expressive" the object might seem to the casual viewer.

A relevant twentieth century example is the late J. Cage's musical compositions. The subject matter of his compositions could be construed on the basis of examples such as the abstract noise of rain, the idea in the artist's mind. On the other hand, when the work of art is a musical composition, it is almost impossible to apply an idea without structure. As John Cage said: "Electronic musical instruments will be to provide complete control of the overtone structure of tones (as opposed to noises) and to make these tones available in any frequency, amplitude, and duration."<sup>21</sup> A musical composition has to have "an organization of sound in order for the rhythmic structure of a composition to succeed." Organization of sound is achieved "through the principle of organization or man's common ability to think."<sup>22</sup> What is important is the perception of art's internal meanings, the intellectually controlled abstraction. At the same time, in order for an object to reflect beauty, it has to consist of the formal elements, such as harmony, rhythm, and symmetry, which constitute the art-work's internal meaning.

Finally, perhaps the question of whether artworks must have some structure or order and whether beauty exists only in "simple units" might be finally resolved by developing the notion that Plotinus' theory does eliminate any implication that there are, right versus wrong or proper versus improper relations, proportions, etc., in beautiful things, or in the way in which an artist must create an aesthetic image in order for it to be beautiful. Aesthetics, in other words, is an exploration of the various ways in which artists in fact choose to construct images of (eternal) ideas in the context of a given culture or historical period. For, the "inner meaning" of artists' work (or their inner discursive processes while creating their art) is always what is most properly the datum for analyzing the conception or purpose of art, rather than the material artifacts in which they concretize that conception or purpose at a given time or in a given culture.

## Neoplatonism: Unity and Plurality in the Arts

L. E. Goodman

Unity is the heart of beauty in Neoplatonism. As Plotinus writes at the outset of his essay on the subject:

Nearly everyone says that it is good proportion of the parts to each other and to the whole, with the addition of good colour, which produces visible beauty, and that with the objects of sight and generally with everything else, being beautiful is being well-proportioned and measured. On this theory nothing single and simple but only a composite thing will have any beauty. It will be the whole which is beautiful, and the parts will not have the property of beauty by themselves, but will contribute to the beauty of the whole. But if the whole is beautiful the parts must be beautiful too; a beautiful whole can certainly not be composed of ugly parts; all the parts must have beauty. For these people, too, beautiful colours and the light of the sun as well, since they are simple and do not derive their beauty from good proportion, will be excluded from beauty. And how do they think gold manages to be beautiful? And what makes lightning in the night and stars beautiful to see? And in sounds in the same way the simple will be banished, though often in a composition which is beautiful as a whole each separate sound is beautiful. And when, though the same good proportion is there all the time, the same face sometimes appears beautiful and sometimes does not, surely we must say that being beautiful is something else over and above good proportion, and good proportion is beautiful because of something else? But if when these people pass on to ways of life and beautiful expressions of thought they allege good proportion as the cause of beauty in these too, what can be meant by good proportion in beautiful ways of life or laws or studies or branches of knowledge?.... Every sort of virtue is a beauty of the soul, a truer beauty than those we mentioned first; but how is virtue well proportioned? Not like magnitudes or number.... And what will beauty of the intellect, alone and in itself be? (*Enneads* I 6.1, after Armstrong).

The classicizing theory that Plotinus here finds so wrongheaded is the same that the youthful Augustine wrote of in his lost first book, *De Pulchro et Apto*,<sup>1</sup> and that the Bishop of Hippo was later both to reject and to recast, when he argued that ugliness can and seemingly must be part of a beautiful and perfect whole, but that nothing is evil in itself. For what is hurtful to our frail natures is admirable in its place, excellent from its own standpoint, and beneficial even to us when wisely and moderately applied—since beauty “is not constituted by bulk, but by proportion and arrangement of the members.”<sup>2</sup>

The rejected theory is also Cicero's, mentioned in his larger schematization of values (*axia*) in *De Officiis*, under the rubric of seemliness or *decorum*.<sup>3</sup> This virtue of appropriateness, the great orator says, is what poets aspire to. Cicero even adumbrates Augustine's aesthetic theodicy by arguing that words which are ugly or monstrous out of context provoke a burst of applause in the theater when they are fitting to the role and character of the speaker in a drama, and appropriate to its action.<sup>4</sup> The point is not of exclusively aesthetic interest. For seemliness and good character are inseparable from one another for Cicero. And moral beauty—a topic cherished by Plotinus as well—for Cicero involves active, and indeed creative appropriation of the roles life assigns us.<sup>5</sup>

But what Plotinus is pointing toward, through his references to the rich color of gold, is the perfect simplicity of the One, the source of all beauty. For the One must itself be beautiful if it is to draw us toward its perfection. It transcends being, but not unity, or goodness, or beauty, which are the marks, or indeed, the themes of being. Unitive experience will be mystical experience, rapt attention to the unity of the One. Or rather, absorption in its unity, the *fanā'* or dying unto self of Sufism, the kiss of God, as Jewish mystics call it. But that kiss comes in death.<sup>6</sup>

No wonder the lively Saadia Gaon (882-942) is not too impatient to enjoy it and omits it from his survey of the goals of human activity.<sup>7</sup> Unity, he argues, is for God; multiplicity for us, His creatures.<sup>8</sup> Avicenna goes further, unwilling to give up individual identity even in death.<sup>9</sup> In this he is followed by Ibn Bājjah,<sup>10</sup> Ibn Tufayl,<sup>11</sup> and Maimonides.<sup>12</sup> All of these Andalusian thinkers accommodate the Platonizing monopsychism of their eschatology to the preservation of individual identity. They achieve this synthesis through reliance on the Plotinian notion that ideas are

eternal as a one/many (thus preserving the individual soul as a one within the unity of the many), and through reliance on the Philoponian idea of self-consciousness<sup>13</sup> (letting the privacy of thought rather than the extendedness of matter serve as the principle of psychic individuation). Their strategy allows even disembodied and immortal souls to retain their identities and thus to enjoy God's kiss. Even Spinoza avails himself of the same strategy, when he rejects the notion that his monism—or rather, the indivisibility of the divine—entails the non-existence or indistinctness of the modes. In each of the Andalusian philosophers the Avicennan strategy is welcomed by a sensibility that balks at the absoluteness of unity—both because of a distaste for the reductive connotations of pantheism and because immortality itself seems not worth the candle if *baqā'*, perdurance, is attained only through the gateway of *fanā'*, annihilation.

Plotinus' quest for simple beauty is rhetorically supported by his argument that a plain face has symmetry and proportion but may lack beauty—perhaps if it lacks piquancy, or liveliness, or character, one might say. But the argument was answered before it was stated, when Aristotle urged, against the excessively organic state of Plato's *Republic*, that too much unity precludes the unification that is the strength of any organism, by submerging the distinctive identities of the members that are to unite in a common scheme, “like harmony passing into unison, or rhythm that has been reduced to a single foot.”<sup>14</sup> Henri Bergson, whose father was a musician, argued similarly that to hear a melody as a melody we must hear its notes in relation to one another, as parts in a whole, or even as rhythmic or tonal contrasts.<sup>15</sup> Their simple beauty, if it can be found, is quite distinct from the beauty we may find in them as music. The idea in Bergson is not unrelated to his thoughts about creativity, the open future and the open society, just as in Aristotle the corresponding idea was not unrelated to his ideas about future contingency, the preservation of individuality in and through community, and, for that matter, the logic of discovery.<sup>16</sup> Even the rich complexity of an orchestral chord or the seemingly simple beauty of a note played on the piano or the clarinet is actually complex, enriched by overtones and given a patina by its timbre. It is not a simple tone. The same, we now know, is true of colors: They are perceived relationally, against a contextual background, and the comparative process is a temporal act.<sup>17</sup>

Saadia carries the point further, in the interest of his pluralistic account of values:

I find some people reckon, indeed they are certain, that it is man's duty to order his whole life by a single trait of character, preferring the love of one thing above all other objects of desire, and hating one thing above all else. Having looked into this view, I find it utterly mistaken, in several ways. To begin with, if the love of a single thing and preference of it to all others were what is best for us, the Creator would not have implanted in human nature the love of any other. Why, He could have made us of a single element, or all of one piece....<sup>19</sup> Don't you see that even the most elementary actions cannot succeed with just one element? How then can the entire complex? For if a builder built a house of stones, or teak, or thatch, or nails alone, it would not do at all—as it would if he built it of all these in combination. The same is true in cooking and food, in drink and dress, service, and all our other needs. Doesn't it open one's eyes to see that none of these specialized activities works with just one means, although all of them serve our comfort? How much less can the needs of our soul and character be met by a single object!<sup>19</sup>

Responding to the Neoplatonic aesthetic ideal of beauty in simplicity, Saadia urges that with colors it is variety that is cheering. He reminds would be aesthetic monists that harmony demands a blend of tones. Pure tones, he explains, are irritating, even physiologically, and (as Aristotle held) destructive if intense; but properly blended combinations can promote not just good cheer but (as Plato's *Republic* suggests) even justice.<sup>20</sup> Saadia links the physiological data as he understands them with a theory visual aesthetics, arguing that it is blending of colors that makes even seemingly simple color sensations pleasing; whereas pure colors are uninteresting, and raw sensations—the light of the sun, the whiteness of snow, the pure vividness of bright red or the deadness of black—are irritating or dulling to the eye, depressing or discouraging if combined too crudely, and harmful if they grow too intense when unmingled.

Simple rhythms and musical modes, Saadia argues, are unpleasant, because they arouse only a single response or impulse in the soul. That is, they amount to noise or irritation. It is the more complex patterns of musical pitch and rhythm that are cheering and pleasing. Wise rulers, he writes, expressing his great faith in the theories of Plato, use such complex patterns to elicit an appropriate

equilibrium in the soul: "It is the practice of rulers to blend and balance these modes, so that the traits of character that hearing them arouses in the people will develop to a pitch that suits their souls for rule and that does not drive them to extremes of lenity or hardness, boldness or timidity, excessive or deficient joy or jollity."<sup>21</sup>

Pressing on from sights and sounds to scents and flavors, Saadia argues that these too have an aesthetic optimum reached through compounding and complexity: "Each scented object has own distinctive force. When these are blended, the effects vary with the proportions of the ingredients. Thus musk is hot and dry, camphor cold and aromatic, saffron hot and dry, sandalwood cold and moist, amber moderately warm, rosewater cold and aromatic. When these extracts are mingled, their distinctive properties are compounded and adapted to people's uses."<sup>22</sup> Saadia takes his illustration from the perfumer's art, where a single essence might be cloying but the complex blend of perhaps dozens of scents produces the distinctive perfumes for which the market has use. Only the sense of touch is exempted from the pluralism of Saadia's earthy aesthetic, since he concedes that our tactile sensations love only what is soft and smooth. But, of course, the concession is made too readily. For there is also a love of roughness, and no designer would exclude it from the palette of textures, as long as its tactile demands were not too great to be apprehended, or to be borne.

What benefit can we find for our own aesthetics in the Plotinian appeal to ultimate simplicity? Overcoming the longstanding feud between monism and pluralism and setting aside the foolish arguments between the exponents of symmetry and the advocates of asymmetry, or of formalism versus engagement, I want to ask very concretely and specifically, What has unity to do with beauty? Beauty, I want to argue, whether in nature or in art, is achieved, not simply given. Unity for us is never mere simplicity. Whether we discover it in nature or produce it in art, it always involves a synthesis of elements. If that intends a higher unity, as Plotinus urges that it must, it can only be by a relation of reference—a structural analogy, or other intentional act. The beauty will be in the relation of intending, not in the simplicity itself.

Consider Plotinus' illustrative remarks about a plain face. It is true that asymmetry—a birthmark, a wry expression, even a

scar—can lend interest where there was little or none. Cosmeticians and dressers have relied on that possibility time out of mind. But does the point support or undermine Plotinus' love of unity and impatience to hasten his hearers up the ladder of love, from the attachments of the body, of which Porphyry tells us that Plotinus seemed to be ashamed, to an aspiration after "the beauty of the intellect, alone and in itself"? Surely piquancy is the mark of irregularity. The scar or eyepatch betokens history, not simplicity. It is vapidness that we may find suspect or ludicrous in the plainness of an open face. Painters understand this when they look for character in a face, and add a fan, a sword, a book, or fascinating draperies, or a distant landscape, when character seems absent or in need of reinforcement or relief. A love of complexity, not simplicity, is what our distaste for plainness hints, and what Plotinus has exposed in our relish for asymmetry is not a deeper love of unity but only an impatience with aesthetic triviality.

The Japanese, we know, shun symmetry in their paintings, for just this sort of reason. Their semeiotics underscores the point: It is bad luck to send a person flowers in an even number, as bad as it would be for us to send a butcher knife as a gift to newlyweds. There's something fatal, in Japanese cultural convention, in the thought of everything coming out exactly even, as suggestive of death as it is in the old Yiddish superstition for one to sew a garment that a person has on. Only a corpse, the superstition seems to say, has sewing done on the clothes it is already wearing, and only in death does everything come out even. Better, then, the favorable sign of leaving a bit of anything left over. But that leftover is not the sign of unity, although mathematical induction might make it a token of infinity.

Philo finds a balance when he argues that if male is odd and female even, it was fitting that the world's creation had six phases, the six days of the Biblical hexameron, since six is the first perfect number, the product of numbers that are its sum: one for God, two for woman, and three for man, so that the whole "should contain the essential principle both of the male that sows and of the female that receives the seed," if the world was indeed to contain "beings that sprang from a coupling together."<sup>23</sup> For no matter how misogynist Hellenistic sensibilities might become, it was not to be denied that the complete world needed the harmony of integration, male and female, odd and even, Yin and Yang.

Closure does betoken unity. We see it in a thousand rose windows, in the still central point or mystic negative space at the center of a thousand domes in medieval mosques, in a thousand Gothic arches, whose arms are raised in prayer, soaring, with the spirits of the worshipers within, up to the heavens, and there finding resolution, clasped, like praying hands, into God's unity. And we can hear the same accepting movement in the rustle of angelic wings that enfolds the great amens of the earliest polyphonic Western music, bringing all motion and all speech to unity and to rest in a silence that combines all the sounds that have gone before and hushes all the noise that has surrounded them. The rose windows embedded in these arches similarly mute the images of the world beyond and suffuse its light into the pictures from a single narrative, itself dissolving into a single moment of meaning that seems to echo, if it speaks at all, only the words of Augustine's literary beatification of his mother, as he wafts her into heaven by describing her, not long before her death, sharing with him (and forgetting his sins and her own) in the beatific vision:

We were saying then, If to any the tumult of flesh were hushed, hushed the images of earth, and waters, and air, hushed also the poles of heaven, yea the very soul be hushed to herself, and by not thinking on self surmount self, hushed all dreams and imaginary revelations, every tongue and every sign, and whatsoever exists only in transition [and here Augustine betrays the Platonizing backdrop to his vision], since if any could hear, all these say, "We made not ourselves, but He made us that abideth forever"—If, then having uttered this, they too should be hushed, having roused only our ears to Him who made them, and He alone speak, not by them, but by Himself, that we may hear His word, not through any tongue of flesh, nor angel's voice, nor sound of thunder, nor in the dark riddle of a similitude, but might hear Whom in these things we love, might hear His very Self, without these [as we two now strained ourselves, and in swift thought touched on that eternal Wisdom which abideth over all]—could this be continued on, and other visions of kind far unlike be withdrawn, and this one ravish, and absorb, and wrap up its beholder amid these inward joys, so that life might be for ever like that one moment of understanding which we now sighed after; were not this, *Enter into thy Master's joy?* And when shall that be? When we shall all rise again, though we shall not all be changed.<sup>24</sup>

But, as Augustine himself confesses, such unity as he pursues is not found within the confines of this earth, but only glimpsed from it. Time itself creates the essential asymmetry that denies us ultimate unity. Human experience can intend but never grasp and hold it, while we live, or think, or know ourselves. It is for this reason, no doubt, that Augustine's language here, while sublime, lacks the simpler sublimity of the Psalms, which tell us more simply (Ps. 19:5) that the soundless message of God's glory, the signature of his handiwork in nature, runs like a ray of light right through the world and speaks wordlessly even without silencing all that is in motion, noisy and alive.

What do we say, after all, to the off key singers, who cannot or will not blend their voices in a single celestial choir? When John Jacob Niles was barely more than a boy, someone gave him a cello, and before long he decided that the instrument was a waste and sawed it in half to make *two* mountain dulcimers. In music school, for an exercise, he wrote a new melody, the one that is now traditional, for the old folksong, "Black, black, black is the color of my true love's hair." In a creative *jeu d'esprit*, he reprised the first verse, and ended his song with the melodic line unresolved: "I love the ground whereon she stands..." His teachers knew what to say and what to do. They threw him out of school.

Plato knows that love is incomplete, the child of Poros and Penia. Augustine himself knows that even when he stole the pears from a neighbor's orchard and wanted nothing from the act but sheer deviltry, there was a hidden good pursued in the seeming senselessness of an act whose fruits were "sweetened only by the sin." He sees now that even in pursuing evil for its own sake his soul was following its own misguided image of God's freedom and absoluteness.<sup>25</sup> But surely Plato, with all his penchant for self-predication, would be the last to deny that love itself is beautiful (and not merely *of* the beautiful), and it would ill behoove a follower of Plato, or of Plotinus, to deny that love, considered in itself, is beautiful, even when its fruits are ugly.

A Hamadhānī will celebrate the libertine spirit of his Abū 'l-Fath al-Iskandarī, delighting in his scams and dodges in much the spirit that a movie like *The Sting* will celebrate the wit of con men and find in gentle grafters (to use O'Henry's phrase) the soul of knowing innocence—at least relative to the cutthroat world of mobsters and murderers they concessively inhabit. Buggery—even

blasphemy—in Hamadhānī's world becomes a *jeu d'esprit*. And we can see, from Augustine himself, how the epiphanies of Rimbaud and Baudelaire find their places in the glass tapestry of the world's rose window.

So we can see the need for complexity and the *haroq*, not just in art, but, with the aid of Augustine or Leibniz, in the work of art that is life as well. But what of unity? It is not absent, surely, in the Ciceronian sense of decorum or the ancestral Aristotelian notions of harmony, balance, proportion, and organicity that form the backdrop and the backstop of Plotinus' discontent. A story, Aristotle tells us, will have a beginning, a middle and an end. A plot, to be the kind of soul that can animate a drama, must have a turning point, a moment of recognition—a moment of truth, as it will be called. Long after the artificial unities of time and place have been laughed at and forgotten, fallen into disuse, the inner connection of action with the thematizing force of interests and identification of audience remains, subsumed into subtler vehicles of unity in the cinematographic butt-splice and visual montage.

When Cicero tells us that a poet aspires to seemliness he is not speaking in any rarefied or etiolated sense of artificial symmetries or hothouse refinements. He means simply that actions should be motivated, that characters should speak in character. Any balladeer or blues singer knows that. For much of the pleasure of singing ballads arises not in the rhythm of the refrain but in the mimesis of direct discourse, bracketed for its verisimilitude—"John, John, the grey goose is gone and the fox is on the town-Oh!"—and much of the joy of listening to the blues springs not from contemplating others' sorrow but from the symmetry of a persona to the reality it represents. There are unities here, but they are the unities, and symmetries, of mimesis. Their pleasures are identical in source to the pleasures of metaphor, or of any well wrought representation.

Such symmetries are dynamic unities. Like the unities of harmony or of organism they depend on difference for their force: the differentiation of subject from object, of object from its similitude. They are unities in diversity, defined against but also through diversity. Diversity is their condition. They are, in this sense, like the Plotinian "one/many," like the unity in diversity or diversity in unity of the universal Mind. Indeed, they afford us a Plotinian glimpse of that mind's thought and help to show us why Plotinus conceives that mind's thought as a kind of life, since even

in their timelessness the Forms that are the content of God's thought are in constant motion, representing one another, the more universal through the more specific, and the more specific through the less so. This play of facets within facets is more than the static kaleidoscope of Platonic participation. It is the play of life itself and the reason why it is possible for Mind in Plotinus' universe to give rise to Soul.

Decorum, of course, can be the emblem of structure, and so of hierarchy and hegemony. One need not be a post-modern to see its decrements. Any romantic will rebel at them, and any creative artist will press and burst the envelope of their constraints, as Beethoven strained against the boundaries set by Mozart, or Mozart against those of Haydn, or Bach against those of Vivaldi. But I think we need to differentiate the constraints of convention from those of human or natural necessity and not allow a love of creativity to carry us to the extreme of supposing that continuities and structures are irrelevant, or that constraints are necessarily the metaphors of social bondage and exploitation. It is easy for aftercomers thematizing a tradition to mistake all deep structures for subtexts and then to foreground what they have taken to be a universal subtext, while ignoring the more explicit and diverse preoccupations of the artists and authors of an epoch. Such in-depth superficiality, if unchecked, produces the illusion that every text (or every text worthy of consideration) has no more fundamental theme than its own textuality. That illusion in turn fosters a realm of critical theory that no longer need regard any text at all, since all that are worth regarding have been made undifferentiable.

The notion that order must mean social order, that structure must intend social structure, and that hierarchies of organization must be celebratory of social hierarchy reads too literally into the formal dimensions of a work, and not literally enough into its material content. The breakdown of literary structure, or of musical structure, can be a metaphor of social breakdown, as it is in the recent musical composition "Lacerations," which refuses the comforts of melody, as an inauthentic response to the horrors of the Great Proletarian Cultural Revolution—and perhaps as too closely akin to the strident primary colors of the pageants and street theater of that epoch's programs and pogroms. But the breakdown of structure can also be emblematic of an emergence, like that of a new manner of individual in *Tristram Shandy*, as will be clear if we

extrapolate in two opposite directions from that axial work—forward to the casual structurelessness of the *Pickwick Papers*, or back to the parodistic picaresque of *Don Quixote*.

In Cervantes the picaresque reflects the episodic genre of the very idylls whose ideal the work systematically unravels. At the same time, Cervantes can drink and refresh himself at the stream of picaresque satires that is fed by *Lazarillo de Tormes* and Quevedo and that arises in the mock epic of Hamadhānī.<sup>26</sup> In *Pickwick*, Dickens can help himself liberally to the gentle humanism of Sterne's *Uncle Toby*. But the Holy Office is no longer the presence that it was in *Don Quixote*, not even in the background, as it is in *Tristram Shandy*. There is no need any longer for a Dr. Slop. In all three of these works, and for that matter in *Tom Jones*, the road is ever present—not quite the addictive road of Hamadhānī, and not yet the rebellious road of Krouac, but the metaphoric road, the road of life. And this road is far from being the organizing principle of an *Odyssey*, a "there and back again," to use Northrop Frye's phrase that is meant to tie together the *Odyssey* with the *Divine Comedy* and the simplest fables of the Aborigine Dream Time, or their high-tech equivalents in the realm of space fantasy, with such intricately plotted tragedies of manners as James' *The Ambassadors*. For here, in *Don Quixote*, *Tristram Shandy*, and *Pickwick Papers*, the road is not a unifying principle, at least not in the way that unity is found in purpose, fulfilled or denied, but only in the way that unity is found in days—"Day unto day pours forth speech, and night unto night conveys the message, although there is no word or sound, and their voice remains unheard" (Ps. 19:3-4).

The wordless, soundless song that goes right through the earth and penetrates the heavens as well is here the hum of continuity and circumstance, in nature and in life, with no large claims about the metaphysics beyond it or the societal norms beneath it. If there is celebration here, it is a celebration of humanity, unaccommodated and unconstrained—of *Uncle Toby* with his childlike tolerance and kindness, of *Don Quixote* in the innocence of his madness, and of *Mr. Pickwick* in the radiant benignity of his "great soul." It matters very little what purposes these men believe have brought them to this road, since it leads all of them to the same end. Their worth is to be judged not by how far or how famously they have traveled (and still less by what baggage they have collected) but by how they have accoutered themselves along the way. Good nature and

good humor, in the end, are what matter in their lives. Whether they know it or not, it is important that we should know it. The lack of structure in those lives (and so in their stories) betokens the ultimate irrelevance not of social structures (for surely it does matter whether one lives in Uncle Toby's world or in the world that persecuted Corporal Trim's brother) but the ultimate irrelevance of what we may take to be our higher purposes—our hobby horses, as Sterne will call them—to the worth or worthlessness of our lives.

I see a role for unity here. It is not the elevated role that Plotinus homiletically assigns to simplicity, as the signpost of the One and marker at once of the direction we must travel toward the Absolute and the extent of our remaining distance from its purity and simplicity. But neither is it the nefarious and repressive role that is assigned to all varieties of unity and structure by the mongers of textual anxiety. These comfortless readers seem too ready to invert the pathetic fallacy: Instead of projecting textual emotions onto nature in hopes of eliciting them in the reader, they project their own and their presumed audience's social worries into the motives and motifs of a text, in the hope of finding there a political significance that will give warrant to their otherwise joyless or fruitless hours of study. Here, by contrast, unity, as in an organism, gives nothing more, but nothing less, than the breath of life.

Vanderbilt University

Warm appreciation to John Lachs and Nicholas Vazonyi for their comments on the first draft of this paper.

2. Augustine, *De Civitate Dei* XI 22.
3. Cicero, *De Officiis* I 93, cf. 126. E. M. Atkins hits the target squarely when she translates *decorum* as 'seemliness', in M. T. Griffin and E. M. Atkins, eds., Cicero, *On Duties* (Cambridge: Cambridge University Press, 1993) p. 37. John Higginbotham uses the term 'fitting' in his Cicero *On Moral Obligation* (London: Faber, 1967) p. 72. Cicero offers the Greek *prepon* as the term he is rendering.
4. Cicero, *De Officiis* I 97.

5. *De Officiis* II 37 with I 98. Plotinus (*Enneads* I 6.4) seizes upon moral beauty not only for its inherent worth but, in the context of his argument, a recapitulation of the Platonic Ladder of Love, particularly because it provides the transition from beauties seen to those unseen. He is thus at pains to stress that moral beauty, "fairer than the morning or the evening star," in the words he quotes from one of the tragic poets, is invisible to the bodily eye. Cicero is equally in character when he evokes moral beauty in a passage sandwiched between two discussions of the public approbation of the several virtues; see *De Officiis* II 37-38. For the creative construction of one's own role and identity, see I 107-119.

Kafih, with modern Hebrew translation, as *Sefer ha-Nivhar ba-Emunot uva-De'ot* (Jerusalem: Sura, 1970). The book is commonly known as the "Emunot ve-De'ot," and will be cited here as *ED*. It was translated by Samuel Rosenblatt, as *The Book of Beliefs and Opinions* (New Haven: Yale University Press, 1948); but 'convictions' is a more accurate rendering than "opinions," as Efros showed, and the full title is important. As Kafih explains in his edition: "In every manuscript of the original version of our teacher, the title is *The Book of Beliefs and Convictions*, and so it was translated [in 1186] by R. Judah Ibn Tibbon [the father of Samuel Ibn Tibbon]. For the text he had before him was that of an early version. But in codex M [Bodleian MS Pococke 148], which is in my view the text of our teacher's final revision, the title is given as I have written it [sc., *K. al-Mukhtār fī 'l-Āmānāt wa-'l-'Iṭiqādāt*]. And rightly so. For our teacher did not set out simply to gather a compendium of beliefs and convictions, but to demonstrate which beliefs were worthy of choice and which convictions were true in his estimation." Page 1, note 1; cf. pp. 6-9: "I do not have any doubt that this is the title in his final revision" (9).

## The Epiphany of Traces in Art: Post-Neoplatonic Visualization of the Invisible

Alicja Kuczyńska

The contemporary fascination with the cultural "now" appears to be slightly suspicious from the theoretical point of view. I do not define the term "now" as an epoch similarly to e.g. the postmodern epoch (Lyotard), but as an ontological phenomenon which should be called an *inter-epoch*, an in-between of the past and the present. It is obvious that no historical period ends or begins suddenly just with one fact. It is equally obvious that in this instance the phenomenon of *turning the past into part of the present* cannot be described in any heretofore known conceptual language; in this way, categories of paternity, reception, impact or renaissance cannot be taken into consideration. Newly-created conceptions such as "non judgmental receptivity," a category introduced by Charles Newman for the realm of art,<sup>1</sup> or various metaphors e.g. the metaphor of the rhizome (Deleuze and Guattari), indirectly connected with our problem, do not express the essence of the contemporary mechanism of *merging together* the past and the present. The difficulty consists of the fact that past intellectual *structures* cannot be any longer the object of critique or reception as *certain entities*, schools or trends as has been the case. At present, due to the "eruption" of postmodernism, and in confrontation with it, their image has been vehemently shattered and deprived of its original holistic form; it appears to be fragmentary and scattered, and assumes the form of particles, fragments enfeebled by negations of history in general, by a cult of posthistory and tendencies towards obliterating boundaries between trends. These fragments and traces do not exist independently *alongside* new modes of thought; the annihilation of the idea of superiority means that together with *the new* they become part of composite, fluid and frequently indistinct configurations and thus

coexist with the new.<sup>2</sup> In this manner, our mode of thought embraces not some sort of a former and complete intellectual *structure* but a stylistic figure of its *trace*. Categories of this *trace* could be in a certain sense compared to the "revival of memory" (D. Bell) if it were not for immersion into the context, characteristic for this conception. A *trace*, on the other hand, leads us beyond the ambiguous text. It is a meaning but one which is *deprived* of historical context. This meaning extricates the *trace* from being envisaged as a correlate of knowledge. The trace testifies to the possibility of a coexistence of contradictions, negates the ambiguity of thought or fact, and comprises a contradiction of a holistically uniform interpretation of a historical phenomenon, an interpretation which reveals an inclination towards becoming total. I regard the *trace* stemming from history to be, most generally speaking, a thought which due to its "*distinctness*" introduces important cognitive contents and, at the same time, is capable of tackling the demands of contemporary thought which attaches importance to lateral thought<sup>3</sup> and which disturbs the sequence of cause and effect.

### I. "Formless Form" and Physical Form

The extensive list of the impacts and influences of Neoplatonism assigns prime place to the thesis, derived already from the philosophy of Plato, of the fragmental form of the trace that influenced i.a. subsequent thought about art, the fate of artistic undertakings, the history of culture and mysticism; this is a view which claims that *true reality must be free from visible forms*. An important supplementation of this thesis is the ensuing conviction that it is possible to "*come close*" to the formless world, and that it is just as feasible to discover its existence or even to reveal it to others by means of certain definite procedures. In certain periods, this statement, which liberalises the rigours of fundamental thought, assumed an absolute form as an imperative of "*coming close*" with the aid of various techniques, different in the cultures of the East and the West. The object of our research includes such Neoplatonic and post-Neoplatonic theories of "*coming close*" which art is capable of embodying. Its role in this process is subject to divergent and composite transformations.

Sensual qualities conceived as all the visible forms, present at the lower stages in the material world envisaged by Plotinus, were treated as unwanted distractions on the path to truth. In the consecutive stage of Neoplatonism, an important step in the estimation of the world of matter is a clearly accented emphasis on the so-called experiencing of beauty and goodness, proposed in his theory by Marsilio Ficino. Ficino studied and translated Plotinus very carefully. At the same time, he built theories about the significance of matter which plays a certain role in his theory of "attraction." Ficino constructed his conception of the attraction of beauty on the basis of an analogy or, sometimes, simply an identification of beauty with *lumen* (light) and goodness.<sup>4</sup> Beauty is an internal and external perfection while goodness is only inner perfection. The fact that beauty acts in a special way i.e. attracts towards itself, is its main feature. All kinds of beauty possess this property. Regardless of its form, beauty manifests itself in attracting towards itself; in other words, things which attract can be described as beautiful. The body itself is neither beautiful or ugly. Beauty appears in it, wrote Ficino, when the body is inhabited by spirit, by an idea which "shines" and "acts within the body." However, this process is not accomplished automatically: light "*descends*" into matter only when the latter is suitably prepared. Conditions for the preparation of matter are described by Ficino in his *Commentary on Plato's Symposium* especially in *Oratio the Second* and *Oratio the Fifth*. The process of preparation is important, and its main pattern is creating the work of art. The subjects of attraction are aesthetically different and, of course, are not all endowed with the same degree of beauty. Ficino stressed explicitly that everything which is beautiful can be subject to attraction more easily. We find here a distant echo of Plotinus who stressed that "the more beautiful a thing is, the more intensively does it exist." Ficino went even further. The sensual shape of beauty is the main reason why matter becomes visible and begins to exist for us. Similarly to light, *sensual beauty attracts towards invisible beauty because it makes contact with its visible symptoms possible*.

## II. Being - Becoming - Attraction

To render the problem of intellectual "traces" clearer, let us consider the relation between the categories of "being" and "becoming" in classic Neoplatonism and in subsequent post-Neoplatonism. Various similarities and differences occur between the two. The later category seems to be a rather new conception of "becoming." One would thus commit a gross simplification if one should try to explain the relation between "being" and "becoming" by referring to the conception of both of these categories as they appear in the history of philosophy. They are expounded in Plotinus' *Enneads* where the world of the senses is endowed only with a *gignetic* mode of being and never with an ontic one, suitable solely to the *kosmos noetos*; in Plotinus' theory *ontic* existence comes to be identified with fullness, perfection and immutability. Later, the changes become more evident. In contemporary art, for example, contrary to classic Neoplatonism, it is precisely "becoming" (a *gignetic* existence) which is a value, a positive state that is more desirable than a being which exists in a once-and-for-all given form. For artists incessant becoming is the essence of being, and a being never "is" but is "becoming." It is "becoming" and never "existing" in a final and once-and-for-all completed shape that reveals being in its perfect, consummate form. However, in the case of the work of art, "becoming" is not to be identified with an injunction enjoining against excessive meticulousness in completing the artwork, so that some room be left for intellectual beauty. During the Renaissance Ficino found in Plotinus' work a positive opinion about "formless forms" which are treated "not as lacking shape but as the very source of even intellectual shape." Michelangelo's well known category of "non finito" is connected with this very idea. This resemblance, though easily perceivable, proves to be, as we have already mentioned, but fragmentary. The intensity of the contemporary developed conception of "becoming" could be compared to that advanced by Marsilio Ficino, for whom everything in the world and the world itself is in a state of permanent becoming. The whole of human endeavour aims at a higher goal: to become God.<sup>4</sup> In this conception, the boundaries between being and not being, between existence and non-existence are blurred, changeable and unsettled; they cannot exist alone because one springs from the other.

In the hierarchy of values, that which becomes and is not completely finished, enjoys a higher rank than ready-made, finished and completed forms. It also marks a more perfect mode of existence since it resists changes and distortions, and is not destroyed by the passage of time. Interpreting the activity of God, Ficino wrote, "In the first place, the great author creates everything, in the second place, he attracts to himself and, thirdly, encloses within himself" (*Commentary on Plato's Symposium*). The fundamental, constitutive element of the existence of the world is the process of *attraction* (*alicere*). All that which has already been created is subsequently subject to attraction. All that which exists is attracted, and involved in a constant process of transition to a higher stage of being. The process of attraction is the basic rule (law) which governs the world; only this process, and not that of creation alone, endows the world of things and phenomena with a certain stability (balance); this is the reason why they are what they are. The process of becoming also embraces a class of material objects whose physical shape proves to be finished, closed and completed, but which are incessantly complemented afresh—these are works of art.

## III. The Artistic Expression of Infinity

Contemporary art is characterised by a tendency "to go beyond the limited impulse, the limited aspect of life and the limited or limiting self."<sup>5</sup> The philosophical idea of transcending reality leads to the destruction of the idea of artistic representation in the work of art, and recalls the question posed by Kandinsky: "Is the entire work of art reduced to a mere ornament?" and: "What is to replace the missing object?"

The artistic expression of the longing for infinity is present in very different works of art, sometimes not evidently connected, e.g. in the creativity of Brancusi and Mondrian.

In 1982 an exhibition of their works was held in New York.<sup>6</sup> Such a joint display can be motivated by the fact that both artists sublimate content to form. Brancusi transforms the recognisable object (bird, table, column) into something new and unique. The memory of "the object new refined, its essence distilled to a degree at which, in defiance of gravity, its ascending weightlessness is

enhanced by the artist's wedding of form and material, hovers at trigger point, trembling in the balance."<sup>9</sup> Leaving the object behind, Mondrian "creates by means of a new reality a Neoplastic two-dimensional world in which equilibrium is maintained by way of the artist's sensitive approach to stability achieved through a subtle balancing of unequal but equivalent oppositions."<sup>10</sup> Concealed motivations of the relations between the works of Brancusi and Mondrian appear to be deeper than merely artistic. The compositions of both artists share a desire to transcend the human condition by means of an applied depreciation of visible reality in favour of an extra-empirical world. For Brancusi, one of the symptoms of this process were attempts at an artistic capturing of the essence of ascension. "Throughout my whole life", he confessed, "I sought only one thing—the essence of flight. Flight is happiness of sorts." "Flight is an equivalent of happiness because it symbolises ascension and transcendence and freedom. Ascension denotes a transition to a different mode of existence, the annulation of the system of determinants, a freedom to alter situations. The symbol of flight expresses a fissure which reveals itself in the world of everyday life. A double interpretation of this fissure is clear: flight is tantamount to the annulation of weight and it is the ontological polemic of man."<sup>11</sup> Brancusi's birds endorse the principle of *coincidentia oppositorum* since in a single object they include both matter and flight, bulk and its negation. The drive towards ascension was shown by means of matter which is the archetype of weight i.e. stone.

The artistically prolific and cognitively important process of overcoming the resistance of matter is realised in art also in other ways. For Piet Mondrian the *dematerialization* of the object is achieved via abstraction, abstract painting. The artist concluded that the spiritual could be sought by purely graphic means, and emphasised that the words *spiritual* and *transcendental* can denote anything from the purely spiritual to that which is on the threshold between the physical plane and the highest stage. It is vain to concern ourselves with the purely spiritual which cannot be expressed.<sup>12</sup> Traces of Platonic thought, discernible in Mondrian's works, occur in a form transformed by theosophy, in which e.g. the concept of "primary forms" or the geometrisation of the world by God was rather frequent. As is well known, Mondrian viewed the proposals of theosophy very seriously.<sup>13</sup> He accepted the

theosophic idea of looking "through the surface" of an object, and acknowledged that the depiction of "the inner image" comprises a domain of the endeavours of an artist who does not neglect matter or turn away from it but who studies it intensely, and in this manner notices its superficial nature contrasted with the essence of being i.e. with "becoming."

#### IV. Being as the Object of Aesthetic Experience

"Becoming" is a process which demands active participation on the part of the subject. Joining heaven and earth together is the unique privilege of human existence through which man asserts himself in a strenuous way that requires a great deal of effort. In his drama *Endless Column* Eliade interprets Brancusi's "Endless Column" in terms of the beginning and the end in a fashion utterly unlike the traditional approach found in Western civilisation. His proposal appears to be significant to all those who having been steeped in this culture from birth cannot all of a sudden cease to exist as its product. On the other hand, they have become fully aware of the limitations of the culture imposed upon them, and gradually come to perceive its insufficiency and the extent of its incongruity with the newly discovered aspects of reality. Can this situation be expressed only in terms of an alternative proposed by the "either/or" type of choice, or in terms of a mechanical partial of the conjunction? If so, is the provision of ever new versions of the alternatives in the manner of contemporary literature and some trends of science fiction, the only way out?

This question, implicit in the intellectual stuff of the drama, is answered by Eliade in the negative. He seems to be saying that there is yet another way out: the alternative can be abolished by referring to the elements which both East and West once shared. The missing link is to be found in ancient myths which are older than later divisions, which are derived from a common beginning and which are eternal. Being timeless, they can unravel the mystery of the beginning and the end which are inextricably intertwined. Young and at the same time old, myth is a challenge to the passage of time. In case of Brancusi's column, the area in which the process of becoming is acted out lies between the highest and the lowest, between heaven and earth. The *endless column* becomes itself only

when it becomes infinite, when it is placed in a deep hollow so that its pinnacle might reach infinity. What is more, there exists only one unique position from which it can really be perceived as endless. Being endless, the column will not stop even in heaven but it will pierce it and go beyond. Described in this way, the *endless column*, as seen by Eliade, will most likely exert a more overpowering impression than its shape. This is probably the case because the impression it makes is fragmented, diffracted and arranged into the individual opinions of the onlookers who do not hesitate to express their distrust, shock, amazement, unbelief or even disgust inspired first by the idea itself and then by its concretisation. How can the mystery of enduring and passing away be explained to them? The notion of endlessness contains all beginning and all end, and the column, which is endless upwardly, must be also endless downwardly. It is this quality of the column which symbolises that what we call the human condition. Rooted in the earth (Ficino's idea of matter) and involved in earthly realities, man frees himself from the mundane with great difficulty. He becomes himself and wins his own identity while climbing upwards; it is then that he finds himself *in-between*. The sculpture is only becoming, its potentialities are still unrealised and the source of its significance is to be found precisely in this status. Brancusi's Indian Temple, for example, had no material existence but existed only in the artist's imagination and its idea was never realised. Thus, it remained a work of art truly in the process of "becoming." The *endless column* also proves to be unfinished, though in a different sense of the word. There comes a time when it ceases to be the object of the artist's endeavour, yet placed within a definite space, it constantly assumes new meanings and thus it incessantly becomes anew.

That what is expressed reveals some features of reality, and therefore that what is abstract takes on a shape which is close to reality. A specific feature of art, and modern art in particular, is its tendency to "free" (itself) from the "surface" of things, and to penetrate matter in order to lay bare its ultimate structures. It is above all the artist, rather than the scholar, who can eliminate form and enter into "the interior of substance." Owing to this ability, he can uncover the "secret of larval modalities."<sup>14</sup> Brancusi says that his column is endless. It freely soars into space without any limits.

It is endless "because it is built upon an ecstatic experience of absolute freedom."

## V. The Contemporary Visualization of Transcendence

In *Phaidros* Plato wrote: "Wings are endowed with the natural power to raise that which is heavy up into heaven, where dwells the family of deities. No other body contains so much of the divine as wings." According to Eliade, yogas as well as Indian alchemists can rise into the air and cover long distances. "A ritual ascension, grade by grade, is called a *durchana*, a different climb." Reference in the *Endless Column* Brancusi turns away from magic and the idea of wings which signify the process of transcending the human mode of being: the ability to rise into the air secures access to supernatural reality. The symbolism of the wings seems to have been decisively rejected: Brancusi's birds have no wings at all. In *Endless Column* the hackneyed metaphor of wings gives way to the image of ascent. Naturally, we may still compare our strivings to the flight of birds but only when the essence of flying i.e. ascension, and not the means with which flight is accomplished, is taken into consideration. Brancusi's birds (*Bird in Space*) present the essence of flying. As human beings we must climb upwards, and just as in the mountains, it is not enough to use our legs—we have to use our hands. This strenuous effort involves both the legs and the hands, and not only winged euphoria which epitomises great evolution and the reassessment of values which the sculptor advanced in his vision of the contemporary human being. There is yet another element constituting the experience of contemporary transcendence. According to *Endless Column*, the ascent ought to be accomplished individually, alone, with no witnesses or partners. Man must enter the temple (Brancusi's *Indian Temple* project) one by one, and "conquer" the column single-handed. If the experience is to have any meaning at all, it must be individual.

## VI. Shapelessness as an Artistic Value

In *Invisible Cities* by Italo Calvino the enormous state of the Great Khan is composed of a continuum of shapeless towns,

deprived of all expressive shape, boundaries and ambiguously defined space. Let us take the example of *Truda*, a town indistinguishable from others. *Truda* has no beginning and no end, it extends over the whole world and only the names of the airports change. The town is everywhere and, for all practical purposes, nowhere since the same site is also occupied by other cities: *Cecilia* and *Pentesilea*.

The reference to the example of the *Invisible Cities* is made as an eloquent visualization of the manner in which traces exist. The thesis about the scattering of the traces of historical distinctness, as well as the very character and quality of the trace, presented at the outset of these reflections, *a priori* excludes the intention of any systematic generalization of its role in contemporary art. This is not the aim of references to distant sources and of following the fate of entire intellectual sequences. We are also not concerned with determining a hierarchy of the importance of the above presented stylistic figures; their selection is in a certain sense arbitrary but it is undoubtedly potentially susceptible to connections with other, divergent trends. It is precisely the latter—the visualization of the undepictable, the dematerialization of the object and space and the search for the artistic expression of the infinite, which appear so rarely in their original state—that have become coated with various accretions and impacts of archetypical contents. By referring to the latter, they constitute a vibrant source of “existential communication.”

# Some Remarks about the Difficulties in Realizing Neoplatonic Thought in Contemporary Philosophy and Art

Werner Beierwaltes

## I

"Neoplatonism" is a characteristic form, historically shaped by several different metamorphoses, of that for which we use, in its various meanings and connotations, the term "metaphysics" or "First philosophy." Neoplatonism starts from principles which are understood as being in themselves, but are related to each other in a successive order. These principles are approachable by thinking, comprehensible and sayable only to a limited extent—in analogies, metaphors or by negating the very categories of thinking itself. "Neoplatonism" is therefore characterized by the conception of transcendent entities which go beyond human consciousness, while at the same time being intensively linked up with it. To generally think reality as grounded in these principles also implies specific *ethical* implications for the thinking individual itself: Thinking the forms of unity; the unity of the One, the Mind and the Soul; to by thinking reconstruct reality which is in itself, *in one's own consciousness* becomes a *form of life* which has its centre and its goal in the First and One itself, which must be strived for in an inward ascent that shapes the individual's life as a whole.

If we want to give a fairly reasonable and instructive answer to the question whether and to what extent Neoplatonic Thought has, in problem-based traces of its terms and concepts or in specific cogitative forms, become effective in contemporary philosophy or in other realms of contemporary culture, for example in art, we must, before going into the consideration of single aspects and the formulation of more detailed questions, first ask the decisive

preliminary question regarding the possibility of Neoplatonic Thought becoming at all effective today: How does metaphysics in the form of Platonism or Neoplatonism stand in relation to the contemporary critique of metaphysics, to the systematic epoché with regard to it? Is it possible to think that Neoplatonic structures of thinking, grounded in their originally intended subject-matter, *can* at all gain ground in a basically anti-metaphysical age? Is it, in the face of the general tendency of contemporary philosophical theories, possible for these structures to become *essentially* effective in contemporary thinking—and is it possible to recognize them not only in analogies that in the end remain purely superficial and that under apparently identical terms or elements of theory only conceal what in its original context and its specific intertion must nonetheless be understood differently? “Neoplatonic” traces, wrought out of some modern and postmodern theories, could turn out to be a mere illusion, provided one is prepared to analyze seriously and responsibly each respective philosophical thought, and not to lose sight of its specific factual premises and original intentions. The *basically* un- or anti-metaphysical character of those philosophies which according to their self-assessment want to and, considering their popularity, can be regarded as the “substance of our time” cannot be concealed even by that forms of philosophy which, like the new transcendental philosophy and the search for a theory of self-consciousness, are not only close to metaphysical thinking, but are, in their form as developed by Kant, Schelling, Hegel and Fichte, also factually closely connected with metaphysics. As a sting in the varied contemporary forms of philosophical theories there remains the more or less revealed suspicion or reproach of the “senselessness” of all metaphysical propositions. This is a suspicion which makes the questions, problems and answers of metaphysical thinking appear “fictitious problems” which seem to talk about things which *cannot* be talked about, or it makes them appear an “illness” which could only be treated if “the words” were brought back again “from their metaphysical to their ordinary use.”<sup>1</sup>

“Platonism” and in its retinue none the less “Neoplatonism” as paradigm of metaphysics or the First philosophy become, (though often) in a reduced and partly distorted form, the epitome of what metaphysics is criticized for. Due to persistent preconceptions or just ignorance, Platonism gets further stylized into a prerequisite or

even into the very cause of the contemporary entanglement of the social being and a calculatory, technologistic way of thinking. Platonism thus appears to be a term-fixing and in itself fixated *thinking of identity* which is close to *totalitarian* thinking (in the view, for example, of T. W. Adorno). Platonism becomes, together with Hegel and Marx, a co-originator of the “closed society” and of fascism (following Sir Karl Popper). All of this is maintained without taking into consideration that a concept of justice as the principal maxim of thinking and acting which is argumentatively based on the idea of the Good simply *cannot* be compatible with blindly ordained irrationalisms (the “nationalistic” or the “racial”), nor with ideological constraints that deny any well-founded recognition. Even Martin Heidegger sees in Plato—analogously to Nietzsche—the beginning of the decadence of philosophical thinking, the beginning of its fixation on metaphysics. It is metaphysics which must be blamed for the primary guilt of a systematic reification of thinking, of its limitation to a way of thinking that forgets the presence of Being and is left to *represent* only beings. This way of thinking develops—as a merely “calculating one”—into the basic attitude of technical aggression, no longer able to think the difference between Being and the being-ness of beings or to experience ἀλήθεια as the “unconcealedness” of Being, and this because, as is supposed, it conceives—from Plato to Hegel—truth exclusively in the sense of the “correctness and the direction of the gaze”, according to the scholastic definition *veritas est adaequatio rei et intellectus*.<sup>2</sup> (2) Heidegger’s curious idea of Plato having to be “blamed” for the development of Western Thinking as a decay of what was in the very beginning (particularly by Heraclitus)—“initially”—thought, is certainly one of the reasons why he finds the “logification” originated by Plato (the ‘Sophistes’ is Heidegger’s main authority) even increased in Platonism—and in its connection with Christianity—and why in his view of the history of philosophy, in his construction of the development of metaphysical thinking, Neoplatonism is not even admitted as one of the decisive elements of this development. Heidegger would never have been able to maintain, in the form he did, and to evolve in further interpretation his thesis of the historical development of thought (the increasing “forgetfulness of Being” and the blemish of the “ontological difference”), if he had ever seriously taken up the claim of

Neoplatonic Thought and the *possibilities* it offers for thinking an "ontological difference."<sup>3</sup>

These are *some* of the difficulties that stand in the way of a thorough and original influence—and its diagnosis—of Neoplatonic Thought in contemporary philosophy, of a "presence" of this kind of thinking which could be found not only in "Neoplatonic niches." Under the circumstances which I have only hinted at here, an effective presence of Neoplatonism which would essentially or at least in some basic elements characterize or guide contemporary philosophical theories is incomparably more difficult to claim than this was undoubtedly the case in former epochs whose vital interests were converted into a theoretical task which, even in its specific transformations, was congenial to original Neoplatonism: So for example in the manifold Platonisms of the Middle Ages and the Renaissance, but also and still in Classical German Philosophy which from the end of the 18th to the middle of the 19th century, with Kant, Fichte, Hegel and Schelling, not only gave paradigmatic answers to the basic questions of metaphysics and transcendental philosophy, but also had a substantial influence on the natural and humanistic sciences, on jurisprudence, ethics, morals, religion, and art, incorporating all of these realms in its conceptual intention. Regarding the history of philosophy *Hegel* could in concepts or cogitative elements which are central to his thought make links to Plato, Aristotle and Neoplatonism. He was the first to insist vigorously on the fact that the hitherto widespread verdict on Neoplatonism as irrational "mysticism," "superstition" or "enthusiasm" *concealed* and destroyed by its persistent unseriousness the central intention of Neoplatonism: that is, its intrinsically rational endeavour for a concept of the Mind and of the One. When Hegel takes up Neoplatonic Thought he understands it as a decisive momentum for the historical unfolding of the "idea," in which, as he says, "the whole is elevated into mind."<sup>4</sup> Aristotle's theological basic principle of the thinking-itself thinking of the God has—in Hegel's sense—in Neoplatonic Philosophy been further evolved into a 'with itself co-expanding totality' of the idea, which is absolutely self-transparent, which is unity that finds itself in absolute reflexivity and which is at the same time the real Self. Hegel intends to discover in the Neoplatonic process of the unfolding of reality his own concept of a productive negation, therefore he wants to see this process begin, as his own "Logic,"

with a self-negation of the beginning itself. But even apart from Hegel's intention, we cannot disregard his taking up of the Neoplatonic concept of a 'dynamic identity' of the Mind and the One *in Mind itself* as an (at best productive) misconception. On the contrary, it corresponds indeed adequately to one of the basic features of Neoplatonic Thought. In so far as we, in spite of the critical epoché regarding a conception of a necessarily-in-this-way-developing history, think and live out of "Hegel's heritage," it is through him that Neoplatonism is caught up as a condition and momentum of the historical self-awareness *also of our present times*, and it is by him that Neoplatonism is preserved as a formative point of reference for the reflection of our own past history.<sup>5</sup> The awareness of this essential aspect is increased by recent Neoplatonism research: It is the significance of this kind of thinking not only for the history of philosophy, but just as much for the *philosophy of history*, a significance which goes definitely beyond an only formal drawing of analogy between two epochs (Platonism and Idealism), and brings out—in spite of all differences—their factual affinity. In the historical awareness of today, in so far as its purpose is more than just an antiquarian and doxographical one, we must also, therefore, in Hegel's reflection on the history of thought, keep in mind the nearness to Neoplatonism which he himself so intensely realized to be an "obliging memory" of one of the most convincing thoughts of metaphysics. This "obliging memory" could above all become effective in a theory of selfconsciousness which does in itself not a priori exclude itself from metaphysical predeterminants.

I have developed this aspect of a factual closeness of contemporary to Neoplatonic Philosophy, together with some other reflections on "Neoplatonisms" in our present times, in one part, entitled "Bild and Gegenbild?" ("Image and counter-image?") of my book *Denken des Einen* ("Thinking the One")<sup>6</sup>—remaining, though, very aware of the general philosophical intentions of today. These reflections regard, in so far as they concern the question of a theory of self-consciousness compatible to metaphysics, the so-called "transcendental question" as the horizon of such theories, and they regard the anti-dogmatic effect of the Neoplatonic way of speaking about the essentially "Unspeakable" which at the same time calls forth an explanation of the grounds and a justification of philosophical metaphors. Another aspect regards the philosophy of

art and the self-conception of the artist today. But before I go into this in more detail, I also want, with Vittorio Mathieu,<sup>7</sup> to argue for a presence of Neoplatonic thinking *ex negativo* which could become a stimulant for changing our ideas—e.g. about our relation to *nature*. The thinking of Plotinus *could* urgently show what is missing in our time. Against the fatal omnipotence which man is exercising on nature today, against the manipulation of man's own nature, against the, at this point, universally perilous claim to the dominion of technical exploitation at the expense of coming generations, Plotinus' totally different concept of nature could be brought into awareness; a concept which contradicts the *mechanistic model* of the way in which we conceive and handle nature or reality as a whole. A way of thinking which loses itself in multiplicity, which is not—or not sufficiently—aware of its own principles and thus characterized by a systematic reification, would have to be transferred into a differentiated reflection on nature or on the unity of man's own ground. The Plotinian concept of an *in-and-by contemplation procreating nature* could enter into the context of other attempts which are today articulated with increasing insistency, to "release" nature from the prison of being a mere object, which has been produced by man's technical access to it.

## II

Regarding the question of the essence of *art*<sup>8</sup> and the *self-conception of the artist*, in comparison for example with the philosophical foundation of art in the Renaissance (as for instance in Ficino's relation to Botticelli's painting) or in comparison with the aesthetics of German Idealism, the situation has also changed fundamentally. For Schelling art still was "simultaneously the only and the true and the eternal organon and document of philosophy..., the supreme instance for the philosopher, because it is as if it opened to him the inner sanctum, where in eternal and original unification it is as if in One flame burnt what in history and nature is separate, and what in life and in acting as well as in thinking must flee from each other eternally." In this metaphysically founded philosophy of art *beauty* is the basic character, the ontological condition or principle of every work of art: "Without

beauty there is no work of art."<sup>10</sup> In every work of art the Absolute shows itself as a historical "counter-image" of itself, capable of infinite modes of interpretation. The ingenious creation of the artist, who by his powers of imagination is able to create in the finite an image of the infinite (the German verb *einbilden*, "to imagine", can also be interpreted as *in-Eins-bilden*: "to create into one"), always goes back to this Absolute, owes itself to it and reveals a "document" of it within a finiteness and boundedness which themselves get *unbounded* by art. Based on his conception of the historicity of *philosophy* and of art, *Hegel* has proclaimed the *end of art* precisely in light of arts highest claim to make the Absolute become historically present in the form (the "ideal") of the beautiful. "Thought and reflection have surpassed the fine arts."<sup>11</sup> The "idea" as thinking which completes itself by thinking all of its different moments in itself, this "idea," and *not* art unfolds itself as the Absolute. As a consequence of the "end of art" in its highest claim and as highest need the time has come for the 'no-longer-fine' or *un-beautiful* arts; and art is no longer bound to certain objects or to beauty as the principle and modus of its depictions.<sup>12</sup> If we want to regard, among others, the ready-mades of Marcel Duchamp, the Dadaism of Jean Arp or Hugo Ball, the arrangements of pop art and the art happenings, the new mythology of Joseph Beuys with its critical intention towards society, the photographic realism or the informal painting of the "new savages" as characteristic expression of contemporary art or anti-art, whose avant-gardism gets ever more quickly stored up in museums, then we will no longer want to accept "beauty" in a classical or transcendental sense as an authoritative or even as an indispensable principle of "artistic" expressions. This is at least equally true with regard to *Plotinus'* metaphysically founded concept of beauty. His concept of beauty grounds in the One itself which is the *principle* of beauty. The essence of beauty is in its highest form conceived as a modus of the Being of the Nous; it is the unity or the con-cordance of the in-itself-differentiated, time-less Being by Being's thinking itself. The absolute self-concordance of the Mind, the dynamic identity of its ideas with Mind itself is its beauty; and this beauty is identical with the "truth" of the Mind which is the reflective flooding-itself-with-light of Being." Such a metaphysical foundation of the concept of beauty can hardly be made compatible, in one coherent thought, with the

contemporary use of the word "beauty" in the self-conception of the artist and in the reflection on certain works of art today. Rather can the predicate "beautiful" be used, at least in reference to some of these works of art, in the sense of a work-inherent accordance of form (structure) and colours or sounds, as an indication of an immanent relatedness or of a harmony of contrasts. Of course this does not mean that "beauty" would now *at all* be totally separable from the structure of art and the reflection on it. Though, where the term beauty is used by the artists themselves for their own creations, we have to be aware of its difference from the traditional meaning of the term—as, for example, is the case with Kandinsky, when he, in a nearly Platonic or Neoplatonic way, points at the "inwardly beautiful": "If the artist is the priest of the 'beautiful,' then this 'beauty,' too, is to be searched for in the same principle of *inner value*.... This 'beauty' can only be estimated with the measure of *inward greatness and necessity*.... *Beautiful is what arises from an inward mental necessity. Beautiful is what is inwardly beautiful.*"<sup>14</sup> In a note to the last sentence of this quotation these apparently "Platonic" features of Kandinsky's argumentation are turned into a psychology which is based on physiological considerations: Beautiful is everything which, to quote Kandinsky again, "even in the totally unpalpable form, refines and enriches the soul. Therefore, for example in painting, every colour is inwardly beautiful, because every colour evokes a vibration of the soul, and every vibration enriches the soul. And therefore, finally, everything can be inwardly beautiful which in its outward appearance is 'ugly.' So it is in art, so it is in life." Is this a remembrance of the outwardly ugly, but inside beautiful Socrates (the "golden statues" in him!) who beseeches the gods for inner beauty?<sup>15</sup>

I could also imagine that a certain *anti-mimetic* feature of modern art could find a counterpart in Plotinus' modification (which is implicitly directed against Plato) of the concept of mimesis as it had been vindicated by Aristotle. As poetry, in its contrast to historiography, paradigmatically shows for art as a whole, mimesis aims at the universal.<sup>16</sup> Thereby art contributes—in another way, of course, than philosophy—to the recognition of reality. The reasoning of Plotinus, motivated by the Aristotelian poetics, is the following: if the arts imitate nature, then they do not imitate it in the sense of a reduplication which only conceals the true reality, "but they rise up to the rational forms (logoi), out of

which nature itself comes."<sup>17</sup> Therefore, art is the depiction of the logoi or, in a wider sense, of the ideas—understood, of course, not only as the designs of the artist, but primarily as the absolute, timeless structures of Being and reflection. If art is not an imitation of nature's outward appearance, but a 'mimesis' of its inward motion which refers to the logoi by contemplating them, then art has, as a perceptible form of the ideas, a fundamentally *anagogic function*: to lead the contemplating observer or the listener from the sensorial appearance back to the intelligibility of nature where it is grounded in—from the image, therefore, ultimately to the image-less. Analogously, the painting of Kandinsky or Paul Klee leaves behind the principle of a purely reproductive imitation of nature in favour of a *transformation* of the outwardly-natural into the "inwardly-beautiful"; this is done in order to bring to appearance in the painting the invisible, dynamic or mathematical structure of nature (or thought). Hereby is shown precisely that which nature does *not* show by itself.

The anagogic function of art makes clear that a work of art (in the sense of Plotinus), due to its being beautiful in the sensorial world, constitutes a specific starting-point or even a provocation for the return of the consciousness, which by contemplation thinks, into itself—the beginning, therefore, of a movement of abstraction in which, in view of the One itself, thinking gets increasingly released from difference and joined in itself in more unity, a movement in which thinking is brought beyond the image up to the archetype and finally, transcending itself, to the very origin which is image-less. The release of thinking from images is analogous to its release from time: the return of thinking to the timeless Mind which is its ground. The mystical henosis with the One itself as a self-transcendence of thinking, as the highest form of abstraction or as a release from object-bound multiplicity in thinking, can without any claim that would destruct the authenticity of art be related to *radical abstraction in painting*. This relation could most convincingly be made recognizable in the radical abstraction which Kasimir Malewitsch has realized—accompanied by programmatic texts—in some of his paintings. The mode of abstraction and at the same time the goal of the movement of this abstraction into an "objectless, white uniformity" is by Malewitsch called "Suprematism." For him, the objectless uniformity or the absolute objectlessness which is reached in painting advances the "true

essence of art." He himself explains this most abstract—the absolute—form of painting like this: "If there is a truth at all, then it is only in the objectlessness, only in nothingness." 'Suprematism' is the "objectless world or 'the released nothingness.'" This 'nothingness,' however, does not mean pure emptiness; rather it can be identified with the active negation of everything objective, or with the "objectless essence—God": "Solely God...therefore carries the features of the objectless essence...Understanding dies, reason dies, the object dies and with it its entire objective world. Space and time die as well as that which we call matter. Names and definitions die. All this is not in God, therefore He is eternal, therefore He is immortal." The artistic intention of this 'Suprematism' corresponds to the *mystical* imperative of Plotinus: ἀφελε πάντα, "take away everything", or "let go of everything"—as a demand to "let go," in reflecting upon one's own Self most intensively, this very reflection ("understanding" or "reason") itself by transcending it, and with this to accomplish the absolute de-materialization, de-temporalization, de-constitution and de-differentiation of thinking, and to release it from all relatedness—all of this being a necessary precondition for the henosis. The goal of Kasimir Malewitsch's 'suprematistic painting' is: "God" as the "objectless essence," the "nothingness"; the goal of Plotinus' inward ascent of thinking, and of the henosis which arises from radical abstraction, is: the difference-less and in itself relation-less One which precisely in its ("object-less") "not-being-anything" is the "nothing-of-everything," while at the same time being, of everything, the ground and origin.<sup>19</sup> In his painting Malewitsch has realized this 'suprematist' conception—increasing the degree of abstraction—in a diagonally divided black and white square;<sup>20</sup> in a black circle on white ground and in a black square on white ground (both around 1913)—an utmost reduction to the simplest geometric elements. The black and the white "supremum" are not separable from each other, they associate a conception of Gregory of Nyssa and of Dionysius the Areopagite guided by Neoplatonic thoughts; a conception which even excels the Plotinian metaphysics of light: the seeing of God as *overbright darkness*—θεία νύξ and θεῖος γνῶφος as φῶς ἀπρόσιτον.<sup>21</sup> The darkness in which "God lives" is the overbrightness, or the other way round: the dazzling overbrightness is the darkness. In an analogous way, for Malewitsch, when he

reaches by total negation the nothingness of the objectlessness or the objectless nothingness, black is simultaneously white.—Malewitsch's relations to theosophy, hermetics and to the cabala can be proved. Hereby he has also been influenced—even though, of course, not in their original form—by elements of Neoplatonic theory.

These considerations on the "mimesis" of the inner structures of nature (concerning Kandinsky) and on the 'suprematism' of Malewitsch, of which I have here only given a short outline, I want to argumentatively furnish and to further develop in greater detail in a separate treatise. This treatise will include: *Paul Cézanne's* thought that "everything in nature models itself like cone, sphere and cylinder" and that the colours are "grand noumena" or "incarnated ideas"; *Kandinsky's* treatment of the geometric archetypes circle and triangle and his interest in number ("in every art, number remains as the ultimate abstract expression"<sup>22</sup>); *Paul Klee's* "imaginative thinking" and *Max Beckmann's* hermetic and gnostic background. It will also include *Piet Mondrian's* geometric abstraction—his conception of art as a "visualization of logic" could be related with Plotinus' depiction of the logoi in a work of art, and his search for a "universal harmony" of the contrasts in form and colour, which leads him, similarly to Malewitsch, to the outermost limits of painting. Furthermore *Barnett Newman's* intention—regarding his critical occupation with Mondrian—to make possible by painting a 'transcendental experience' of 'the sublime' which goes beyond our usual experience, a 'transcendental experience' which is capable of intensively drawing the observer into a limit-less, form-less and definition-less continuum of colours in a nonetheless structured "image" and at the same time liberating him<sup>23</sup>—analogously, again, to the Plotinian henosis. Certain forms of *Concept-art*, too, will have to be taken into consideration: their tendency to dematerialize art would have to, in the last instance, lead to a *dissolution* of the visual appearance of what is thought, and end in the "pure ideas" from whence the visual appearance has come.

A different kind of provable relation to Neoplatonism I see in *Anselm Kiefer* (born 1945 in Donaueschingen)—at least in a certain period of his creation. In his far-reaching interest in the history of ideas he has included the hierarchy of the angels unfolded by *Dionysius the Areopagite*. I think Kiefer, who has become

successful above all in the United States and whose work has also given rise to politically controversial discussions, does not refer to Dionysius just accidentally or in a superficial way. His two paintings of *Die Ordnung der Engel* ("The Order of the Angels") from 1983/84 and from 1984/86 have become the most recent examples for the history of the influence of Dionysius the Areopagite in the realm of art. The first version of "The Order of the Angels" (3,30 x 5,55 m) can be found in *The Art Institute of Chicago*; the second one, being of the same size, is found in the *Walker Art Center* in Minneapolis. The painting in Chicago has the title *Dionysius Aeropagita* [sic] *die Ordnung der Engel*. In the upper right side the names of the nine choirs of angels are written beside and underneath one another; rays radiate from each of them within a black, brown, blue and grey space, meeting nine rocks or stones. These nine stones, of different sizes, are each marked with ■ Roman numeral. Conceived as a representation of the angels,<sup>25</sup> a snake is winding between stone II and III. The paintings of Anselm Kiefer have a strongly symbolic character; they are an expression of a complex and in itself diverse "mythology." This is also the case with "The Order of the Angels": The rays which start from the names of the nine choirs of angels—meeting and connected with the stones—associate another theme which can be related to Dionysius, a theme to which Kiefer, in the same period, gives an artistic form in at least three versions. He entitles these paintings "Emanation" and "Ausgießung." They signal the *emergence* of a divine force out of the skies into the water and onto the earth, and refer, together with the symbol of the ladder and the snake, to the *return* of this emerging movement back to its beginning: corresponding to the circular movement *μόνη—πρόδος—ἐπιστροφή* in Dionysius,<sup>26</sup> but also in the Jewish Cabala, with which, particularly in the unfolding of the Ten Sefiroth, Kiefer has occupied himself. One thought which is intended to be expressed by this emerging and returning movement is the *re-institution of an ideal order*.—The title of the painting I first mentioned, "Dionysius Aeropagita," is not a mistake, but anticipates the insertion of a "propeller" in the second version of "The order of the Angels."<sup>27</sup> This could be interpreted as an attempt to connect ancient and modern ideas; but it can also be related to Dionysius: The spiral movement which is caused by the "propeller" corresponds to the in-itself-constant spiral movement of the "divine spirits".<sup>28</sup> A remaining-in-itself and

at the same time a movement emerging from itself, a circling around which cares for those in need *and* a circling around the "beautiful and good cause" of the angels' very sameness. Therefore the spiral movement unites the circle with the straight line. Simultaneously, the propeller stands for the element of air (ἀήρ), thus bringing to four the number of elements—earth, water and fire—present in the other paintings. The propeller might also remind us of the "en-lightened" soul (κουφίζεται), symbolized by flying, which since Plato has been regarded as a symbol of transcending the material world: By seeing the ideas on the "plain of truth" the soul grows wings, it is "nourished" by truth, and the wings nourished by truth render the soul "en-lightened"—this as opposed to the "forgetfulness" of the soul (a-letheia versus lethe) and as opposed to κακία (depravity), which both burden the soul and make its wings fall off, so that the soul itself falls down to earth."

### III

Let me add a *personal consideration* of Plotinus to these fragmentary and at the same time preliminary remarks regarding the question of the "presence" of Neoplatonic Thought:

The structure of Plotinus' thinking and the way in which he writes are an expression of a conceptually founded contemplation, of ■ meditation which circles around its cogitative goal, of a rigorous concentration on the inwardness of the own thinking and at the same time on its transcendent ground which in its being-as-such withdraws itself from all categories. An intensive, not just historically distant involvement to this movement of thinking could possibly also lead to a homoiosis, in which *one's own* thinking, that is the thinking of the person who lets herself get involved, gets changed in such a way that thinking makes itself more akin to itself. This involvement could, even in contexts of subject-matter different to Plotinus, promote and confirm that self-reflection and conceptual concentration which is necessary for any kind of philosophizing at all.<sup>29</sup> This claim arises from and corresponds to my own experience in dealing with the way in which Plotinus unfolds his conception of *self-knowledge*. With all its (historically different) connotations, this self-knowledge should be the beginning and the constantly self-renewing end of doing philosophy.

Ultimately, Neoplatonism fails to reach its goal of adequately thinking the One in its being-as-such, because of the categories and the difference language is determined by. Signs of this failure to find an unmediated linguistic access to the One are the metaphors, analogies and paradoxes, but above all the negative dialectic: its circling around or surrounding the principle and the experience of the Self with it negates all categories. From this effort springs an anti-dogmatic impulse in philosophical speech. An indirect, in many aspects mediated way of speaking, always open to questions, seems to be necessary, if we do not want to give up that which is not sayable in definite or formally adequate terms as a mere deceitful illusion. Against the often quoted Wittgensteinian ban on speaking, "of what one cannot speak one must be silent," Neoplatonic—as a paradigm of metaphysical—thinking understands itself as ■ conscious *venture* to unfold or to paraphrase with increasing precision the central point of reference for thinking which remains accessible only in an indirect way. Therefore, it is precisely the incommensurable which becomes a challenge for our concepts and our language—which in their interaction call forth an awareness of their respective limits in exceeding them. The continuous "going-too-far" of thinking and speaking about what is thinkable and sayable is everything but an absolutistic claim. On the contrary, it arises from ■ confession of their own relativity. This is, in my opinion, a sensible alternative to an *unquestionable* self-limitation to that which we think we always already know.

NEOPLATONISM AND  
CONTEMPORARY  
SPIRITUALITY

# Neoplatonism and Western Christian Man

John N. Findlay

The present paper attempts to sketch the relevance and influence of Platonism and Neoplatonism upon the thought of Western Christian Man, both in the earlier ages of undiluted faith, and in this later, post-Renaissance age of highly critical, but deeply penetrating infidelity. What I shall now present and offer can only be a sketch, which may, however, be filled out by chapter IX in my book entitled, *Plato: The Written and Unwritten Doctrines*, which chapter is a general Appraisal of Platonism and its Influence. It is impossible, in assessing the importance of Platonism and Neoplatonism to Western Christian thought, not also to attempt some general statements of what one thinks Platonism, as a style of thought, basically is, and how it stands to Neoplatonism, a general statement which must necessarily be highly controversial, since on my view most contemporary characterizations of Platonism are warped by a deep confusion of Platonism with the Socraticism of the earlier and of some later dialogues, e.g. the *Theaetetus*, which all have a great appeal to contemporary analysts, and by a too easy acceptance of Aristotle's two-world picture of Platonism, as merely attempting to solve the problems of our changeable, multiple world by postulating the existence of another parallel world of entities which, by their changelessness, are unfortunately quite unable to account for change and motion in our world, and which do not even reduce its multiplicity in an important manner. That participation in or imitation by man of an eternal Manhood itself can suffice to make changeable men be the men they are, seems a very much ad hoc, unenlightening sort of philosophical explanation. If Platonism were merely the analytic exercises that Socrates practiced, or the mere linkage of earthly beds with a bed made up in heaven, as suggested in the *Republic*, Book X, then obviously there is little profit to be derived from it, and the lists of two or three or four or

ten or other numbers of fine-spun categorical distinctions, which Aristotle was always so ready to draw up, might seem to offer much more hope of illumination. And on such a view the Neoplatonism of Third Century Alexandria and Fifth Century Athens were merely a baroque extension of the meaningless multiplication of entities which Platonism had always practiced, coupled with indecent ventures into theurgic magic and unphilosophical mysticism. My opinion, on the other hand, is that Platonism represents one of the permanent alternatives in philosophical interpretation, one which sees the true substance of reality rather in universal meanings than in the particular instances which inadequately and vanishingly exemplify them, which makes the universal sense come first, and the particular illustration depend upon it parasitically, rather than the other way around. And it is also my opinion that Neoplatonism is what its main exponents believed it to be, a systematic but not uncritical restatement and development of the basic positions of Platonism, and further, that it represents one of the most permanently valuable and illuminating ways of regarding reality and experience which at least does full justice to those transcendent values which guide us inescapably both in theory and in practice.

I believe further that Neoplatonism is important as showing us a mysticism which is rational, and a rationality which is mystical, and thus establishing an apical identity of these two necessary experiential approaches. And I believe lastly that Christian thought has been immeasurably deepened and strengthened by a Neoplatonic infusion, which we encounter again and again in the finest expositions of Christianity, and that the attempts of some to deHellenize and to dePlatonize Christianity have really been attempts to barbarize it in a quite horrible manner. Our views of Platonism have not, in my opinion, to rely merely on his dialogues, but also to pay deep attention to the Aristotelian reports on Plato's Unwritten Doctrine which occur in Aristotle's *Metaphysics* and other works. Aristotle may not have been strong in understanding Plato's teaching, but this leaves unaffected the fact that he reported it in detail and with obvious accuracy, having been present at the discourses where Plato expounded it. These reports can be understood by us, in the light of many commentatorial writings, even if Aristotle could only misunderstand them, an operation for which he had a certain genius, in other cases as much as in this one. In the light of these reports, it would appear that developed

Platonism gave a central place to mathematics and that though it did not identify its Eide or Forms or Natures with mathematical entities, these latter having a non-eidetic multiplicity, (whereas Eide were each and all unique) and occupying a place intermediate between the Eide and their sensible instances, it none the less believed that the Eide were all mathematical universals, and that everything, if subjected to a last analysis, would reduce to numbers and to ratios of numbers. The qualities of the sense-world, in which Plato took such a deep aesthetic interest, were not the simple characters they appeared to be, but pointed to underlying numerical ratios and proportions not unlike those that the Atomists also believed in. The whole cosmos was in fact seen in Pythagorean terms, as involving an ordered set of numbers and numerical proportions differentiated into several dimensions, and explanatory of all the surface appearance of the world and of the soul and mind that is aware of them. These eidetic numbers and structures further involve two basic archaic principles, whose repeated application to one another generate, or give rise to, in a non-temporal sense of generation, all the *Eide* which can be developed and applied in mathematics, and here we must instance first the infinite series of the natural numbers, then all the possibilities of linearity, then all the possibilities of two-dimensional figure, and then all the possibilities of three-dimensional solidity, and finally all the possibilities of movement which involve eidetically temporal as well as three eidetically spatial dimensions.

Without being able to write a Fregean *Begriffsdireft* or a Russellian-Whiteheadian *Principia Mathematica*, Plato conceived of the possibility of developing all the basic conceptual forms of mathematics out of the interaction of two Principles, a Principle of Unity or Limit which was good and definite, and a Principle of the indefinite multiple, or continuous or dual, which was as such bad, but which could be limited by the Principle of Unity or Limit to give rise to the endless series of natural numbers. And the endless possibilities of one-dimensional lines, then the endless possibility of regular or irregular polygons, ellipses, etc., the possibilities of regular and irregular solidity, and also all the possibilities of motion whether regularly shaped or circular or irregular. The best place where all this doctrinal is hinted at is in a passage in Sextus Empiricus' attack on the Mathematicians by which he plainly meant, not only Pythagoras, but also Plato. I have translated all this

material and also all the relevant Aristotelian passages in the first *Appendix* to my book on Plato's Written and Unwritten Doctrines. It is arguable that all this vast project of mathematicizing all meanings and developing them one by one and step by step out of the repeated application of two principles, one good, definite and unitary, and the other bad, indefinite and dualistic, underlies the whole program of education set forth in his *Republic*, and which is largely unintelligible to the interpreters of this dialogue because they wished to see in it mainly ethics, while Plato believed that a completed insight would reduce everything, including ethics, to eidetic mathematics. The same principle of harmonic proportion of definiteness, imposed on the indefinite, which governed the forms and laws of numbers, lines, figures, solids and solids in motion, would also govern the inner workings of souls, and of the societies in which souls live and cooperate with one another. You will remember how, in his *Republic*, everything went wrong when citizens and governed ignored or bypassed the precise numerical proportions which generate well-ordered and just citizens working together in a well-ordered, Platonically just society. You will also remember how the soul in the *Timaeus* was constructed out of a series of numbers and numerical ratios, whose presence in it enabled it to know and understand all the objects it would encounter in the world, and would also enable it to impose orderly and proportionate movement on the instantial cosmos around it and on its own body and mind. Everywhere we have a principle of Absolute Goodness or Unity, whose function it is to impose order and definite limit on a principle of the Continuous and Indefinite, which is, in its native state, bad, and which in the process generates first of all the natural numbers, then all the possibilities of one-dimensional linearity, then all the possibilities of two-dimensional figure, then all the possibilities of three-dimensional solidity, then all the possibilities of moving or self-moving solidity which constitute the lifeless and living forms of nature, and finally all the possibilities of soul and mind and society, which represent the highest and richest imposition of formative pattern on the element which in its isolation is without form and void. And Platonism quite plainly puts a trinity of absolute forms at the head of the whole of this indefinitely ramifying system.

There is first of all the Absolute First Principle of Unity or Goodness which is the source of all specific forms of unity and

order whether in the eidetic or the instantial realm, and which is also the source of all the mental acts which can take cognizance of all such eidetic or instantial specifications. This is the purport of the well-known sun-passages in the *Republic* which I forbear from quoting and which also imply the view that the source of all eidetic being is itself beyond all eidetic being and characterization, and which, though spoken of as the Idea of the Good, is not, strictly speaking, an Idea or Eidos at all, nor knowable as its specific forms are known. The Good is the source of all being and all knowledge, but transcends both. In addition to this Prime Principle of Absolute Unity or Goodness, there is secondarily a demiurgic Cosmic Mind, which embraces all differentiations of possible being, conceived in all the well-ordered simplicity which no instantial embodiment distorts or disturbs. This demiurgic Mind lives with timeless exemplars in a timeless fashion though what it embraces is conveyed into the realm of changeable instantiation by a Third Principle called the Cosmic Psyche or Soul, which is the source of all the regular motion of the Cosmos, and which also presides over a whole order of subordinate souls of men and other living creatures, which each have the power to move a specific part of the instantial world as their own territory or body. In such souls there is also present a simulacrum of the demiurgic, cosmic Mind which enables such souls to be aware of timeless Eide as well as of their changing instances, and such souls, though not invested with the timelessness of the demiurgic Mind, have a deathlessness which amounts to unending being in time. All this is to be found in the *Timaeus* and the *Phaedo* and other Platonic dialogues, though the dialogue form sometimes substitutes pictures and analogies for authentic eidetic descriptions.

Summarizing the total Platonic picture we have a supreme category represented by the Absolute One or Good, a principle which is at once the source of all the Eide, or Forms of Being while itself being ἐπέκειναι τῆς οὐσίας, or beyond being in dignity and power. It is, we may say, the power of everything and the definite being of nothing, two sides of itself that are worked out elaborately in the wonderful dialogue *Parmenides*. It is also the source of all mental insight or knowledge while not itself, by implication, being an object of such insight. Like the sun, it blinds those who try to look at it directly, though it brings out the colours of all other things. We then have as the second Hypostasis the Demiurgic

Mind, which is the eternal vision of all the Eide, systematically and timelessly ordered, and which is also the source of all their instances in minds and souls and in nature. As Third Hypostasis we then have the Soul of the World, informed by all the arithmetical, geometrical and kinetic patterns which it is able to impose on the instantial world, and also the source of the regular motion of the Heavens and indirectly of all other cases and forms of motion. The Demiurgic Mind operates out of time, whatever it embraces or envisages, timelessly *is*. The Soul on the other hand, operates in Time, which Plato describes as the moving image of eternity; the soul is accordingly imperishable, undying, rather than aeonian or eternal. Beneath these immaterial hypostases lies the great empty receptacle of three-dimensional space, which provides the necessary room for all the multiplied instances of the Eide. In itself it is known only by a form of ignorance or a bastard argument to the effect that whatever instantially is, must be somewhere or other. Space is the home of instances of the first four of the geometrical solids, the tetrahedron, the cube, the octahedron and the dedecahedron, which are the elementary building-blocks of the world. Inferior souls, of which our souls are one species, preside over complexes of these building-blocks as their bodies, but pass in deathless Pythagorean fashion from one such perishable body to another, with interim phases in which they take a vacation from bodies and the senses, and have commerce only with other pure souls and eternal minds and with the Eide present to such eternal minds. I need not elaborate all this Platonic Cosmology, which is to be regarded as allegorical ideas rather than mythic. It is meant to describe Being as it authentically is.

If we now turn to the Neoplatonism elaborated by Ammonius Saccas in Alexandria in the Third Century, and expounded in the fifty-four superb tractates of Plotinus, we shall find little that is not to be found in the writings of Plato. "These doctrines," Plotinus says, "are not novel, but ancient, though not put with full explicitness, and our present words are merely their interpreters, calling on Plato's writings, to bear witness to their antiquity." (Ennead V.8) I shall content myself therefore by merely indicating the points where Neoplatonism may be said to have developed or altered Platonism. The first point of difference is a negative one: Neoplatonism shows little influence of the Unwritten Platonic doctrine that the nature of all Eide is numerical or mathematical.

There is a tractate on Numbers in the last book of Plotinus, but it is concerned with multiplicity in general rather than with the arithmetical differences which Plato made so basic. Proclus, the great Fifth Century Platonic systematizer and commentator, wrote a treatise on Euclid, but it contains no references to Plato's mathematicizing theories. The absence of interest in Plato's mathematical emphases meant that these emphases were forgotten in later interpretations of Platonism and only began to be studied in the last century. Neoplatonism also innovated in recognizing Aristotle as being merely the somewhat dissident Platonist that he actually was. There was, they held, a homodoxy or agreement of basic opinions between Plato and Aristotle. Among the important borrowings from Aristotle in Neoplatonism were the concepts of the Potential δύνάμις, and the Actual ἐνεργεία. They were, however, so modified in their use that the Dynamic became for the Neoplatonists more actual than the Actual: the One which is all things in power is more absolutely all things than the one-sided instantial realizations that stream from it. Another borrowing from Aristotle is the concept of ὕλη or First Matter which is not Platonic: Plato's only first matter is empty space. The Neoplatonists made Matter the Principle of Evil: it brought deviation from good form in varying directions into the realm of instances. Plato, on the other hand, in the dialogues and certain passages in *Simplicius*, gave deviance a secondary place even in the realm of Eide: if one knows all the perfect forms of Being, one *ipso facto* also knows all the forms which deviate from this perfect standard, since *knowledge is always of contraries*. The Neoplatonists, further, made the doctrine of the Three Hypostases, the One, the Absolute Mind and the World-Soul, more centrally emphatic than it was in Plato: they based their Trinity above all on a passage in *Epistle II*, 512 e, where Plato speaks of a King of all for whose sake all is, and who is the cause of all things lovely, and also of secondary beings surrounding a second being and tertiary things surrounding a third. In the doctrine of the One or Good, the Neoplatonists were, further, more given to negative theology than Plato: it is only from our point of view that the One or Good is an object of desire and satisfaction, or a source of illumination and so on. In and for itself it transcends all these things, and neither takes cognizance of itself nor of anything else, nor takes delight in its transcendence of being. This transcendence of consciousness, which must however be

understood eminently as well as merely negatively, differentiates the Godhead of Neoplatonism very strikingly from that of Aristotle. Aquinas, however, likewise makes God's omniscience only analogically a case of knowledge, in the sense in which we can have knowledge. The Neoplatonists further developed a doctrine of ecstatic unification with the One which is certainly not explicit in Platonism: there is no suggestion in the *Republic* that the crowning vision of the Sun is in any way a becoming wholly sunlike, even if there is an analogy drawn between the Sun and the eye which can see it. There are, in the phenomenology of soul-life, undoubtedly crowning experiences which merit the name of states of unification or identification with the central focus of everything: not only Jesus but also saints like Teresa and John of the Cross experienced them, and there are of course countless Hindu and Buddhist and Islamic mystics that have likewise testified to them. There is nothing emotionally ecstatic in such experiences. They must be merely the clear manifestations of the all-in-allness of the Absolute in which there simply is no place left for an outside observer or commentator who can only talk in analogical fashion later on. I have not myself enjoyed any such consummation, but I am as confident of their existence as of the transfinite number which is the number of all finite magnitudes and states of being.

The ecstasies of Plotinus are as beautifully described at various points in the *Enneads* as are those of Dante and St. Teresa. The nearest approximation to these in Plato is in his vision of Absolute Beauty in the *Symposium*.

Neoplatonism also clarifies Plato by its concept of *ἐκλάμψις* or irradiation, to which the name 'emanation' has been customarily given. Every hypostasis necessarily gives rise to other hypostases which lack its fullness of realization, and which accordingly turn toward the fuller hypostasis, and strive to achieve its greater perfection. Thus, the absolutely unified One necessarily gives rise to the Mind in which Subject opposes itself to Object, and in which each Eidos is distinct from every other; the Mind necessarily gives rise to Souls which run through everything successively or synthetically in time and work endlessly toward a unity which the Mind always simply and completely possesses. Souls similarly proliferate in *Logoi* or reason-principles which govern the structure and the behaviour of natural objects. At the outer limit of such *ekklampsis* lies *Matter* or pure structurelessness, the sheer darkness

which is a necessary counter to pure light. The *ekklampsis* of Plotinus is described in terms of many empirical analogies: the warmth given off by fire, the fragrance of flowers, etc., but its basic sense is logical and not empirical. Plotinus believes that eidetic perfection cannot exist without instantial imperfection, and that the latter has an irremovable tendency to move toward the former and close the gap between them. The doctrine is here anticipated by Plato's doctrine of the Unenvianness of God. God *must* desire that there should be other beings beside Himself which, though not perfect as He is perfect, will perpetually strive toward His perfection. This doctrine, though embraced by Meister Eckhart and Angelus Silesius and other German mystics is, of course, of doubtful orthodoxy. I myself hold it to be of quite certain truth. It does not, as the Neoplatonists insist, involve any constraint or unfreedom in the process of emanation and irradiation. Though this cannot thinkably be absent, it is also unconstrained and free. The One could not transcend Being and thought as it does if it were not also surrounded by the eidetic and instantial and cogitative hypostases which flow from it, and which are, in a fashion, merely the working out of its own absolute fullness.

Neoplatonism is further distinguished by the glorious pictures it paints of the life of absolute Mind, pictures in which there is nothing of the tendency sometimes present in Plato's writings, to isolate one Eidos from another, and not to see them as always contributing to a single hierarchically arranged whole, in which nothing makes sense apart from anything else. The profound internality of the relations in the Intelligible World of the Neoplatonists is not to be confused with the universal internality of relations in Bradley and other later 19th Century idealists, since the latter is a causal internality inspired by Spinoza and contemporary deterministic science, whereas the Neoplatonic internality is an internality of Eide or Ideal Types, which are not instantial realities, but only the eidetic possibilities of such.

What Platonism and Neoplatonism believed in was that one could work out a completely arranged hierarchy of Eide as one can work out a similar hierarchy among cardinal numbers, or regular polygons or regular solids and so on. It seems likely that Platonism envisaged a future physics and a biology that would determine that there could be just *n* types of self-moving biological solids, precisely just as solid geometry can determine that there can be just

four types of regular solids. In the Intelligible World every species or Eidos would have its unique, necessary place among the possibilities of being, and the nature of each would be determined by its place in the whole system of such ideal possibilities. Perhaps Platonism was in a truly prophetic manner anticipating the modern theories of the chemical structures and various classes of particles which underlie it, and make it plain that there can be just so many types of emergent chemical elements and no more. Certainly also it was able to conceive the possibility of some such deeply integrated physical theory as that of Einstein, where practically *anything varies systematically* with practically anything else, so that both can be regarded as different forms of some more profound thing, e.g. Space-Time, instead of Space and Time, and of Inertia-Gravitation instead of either alone. Plotinus describes the Intelligible World in the celebrated Tractate on Intelligible Beauty as a world where each is all, and all are all, and the glory is infinite, where the sun also is all the stars, and all stars are the sun, and where one cannot go on a journey without taking one's point of departure with one, and so on. All this can be read as merely an aesthetic effusion playing with the idea of an indefinite interpenetration of essences: I think, however, that what Platonism is also prophetically anticipating is the discovery of dominant universals which will leap the distances between apparently disparate concepts and which will thus show them to be systematically derivable differentiations of single basic ideas. This at least is what I read into the Plotinian accounts of the Intelligible World and if they also describe the blessed condition of disembodied intelligences, privileged to see themselves in everything, and everything in themselves, and also everything in everything, and everyone in everyone, then this too represents a higher fusion of the mystical and the rational which has in modern times richly occurred even in the physical sciences.

The Neoplatonist account of the Mind and the Intelligible World further borrows from Aristotle the view that there is at the intelligible level no distinction between the intelligible Form that is cognized and the intellectual act which cognizes it. In the intelligence present in finite human souls these two are distinct, and the finite human intelligence merely strives toward the full identification with the intelligible form which is its consummating actuality. The finite human intellect is therefore always passing in

time from one eidetic insight to another. It is essentially given to λογισμοί or reasonings, which drag it on from one Eidos or connection to another, and never sees everything all at once in its undivided unity with everything. The finite human intellect is therefore in a sense realistic: it seeks to apprehend an intelligible Eidos, or connection among Eide, which is prior to it, and independent of it. But the infinite hypostatic Intellect is neither realistically nor idealistically describable: its timeless acts of intellect do not create or constitute the Eide which it distinguishes, though Plotinus sometimes speaks as if they do. It is rather to be thought of as coeval, coeternal with the latter, with the articulation of eidetic Being into the structured world of the Eide goes the articulation of noesis or timeless acts of thinking which apprehend the latter, and *vice versa*, and neither should be thought of as any sort of temporal primary to the other. The quarrel between realism and idealism is a quarrel only for us men: in Divine intelligence it is as correct to conceive of noetic being as determining noetic apprehension as of noetic apprehension as determining noetic being. I think this is the one wholly successful resolution of a perpetual philosophical conflict.

Of the life of the Third Hypostasis or Soul Neoplatonism has a great deal of interesting things to say, which do not however range far beyond what we find in the Platonic writings. Great stress is laid on the undivided character of the soul, so that all its psychic attitudes come together and are one at the center of its being. A pain in the toe and a thought of intelligible beauty can be psychically together in a manner which would not be intelligible at a merely bodily level. But the souls of various living beings also have some degree of sympathetic rapport with one another, and with the all-encompassing world-soul, so that there are many supernatural and magical forms of communication among individual souls, and between these and the world-soul. There must be, in short, something like a cosmic telepathic system connecting all souls with one another, and with the world-soul, and that system can also mediate dynamic connections among souls, which, in the relation of the finite soul to the world-soul, can assume the form of theurgy or divine operation. This doctrine of theurgy is one that recurs in almost all forms of mysticism and religion, and is, to my mind, not inherently irrational. I believe that with deepened connection with the unitary source of all being must necessarily go

an accession of powers that may transcend what is ordinary, and so be regarded as miraculous. But with the development of such powers must, unfortunately, go also the development of that fraud and imposture which seems endemic to religion. Possibly the Absolute has greater tolerance of such fraud and imposture since it may well touch off profound spiritual and metaphysical perceptions that would not otherwise be readily available to us men. This man, however, is not inclined to sanction a deepening of spiritual and metaphysical perceptions at the cost of means which involve fraudulence, and not merely what is ritualistic and symbolical and not fraudulent. I am, for this reason, not favourably attuned to the theurgic aspects of Neoplatonism.

What I now propose to sketch is the interaction of Neoplatonism with Christianity, and with the subsequent thought of the Christian West. Neoplatonism at an early point of its development made a most remarkable marriage with Christianity, and Alexandria, Cyrene, Carthage, Rome, and other places became centers where theologians arose who used Neoplatonism as the philosophical key to Christianity, sometimes achieving such a doctrinal syncretism that Harold Cherniss is able to say of Gregory of Nyssa (331-94 A.D.) That "but for some orthodox dogmas which he could not circumvent, Gregory has merely applied Christian names to Plato's doctrines and called it Christian" (*Platonism of Gregory of Nyssa*, [1930], p. 62). In much the same manner, Jay Bregman in his recent studies of the Philosopher-Bishop Synesius of Cyrene (A.D. 365-414) is genuinely puzzled as to whether to call Synesius a Christian or merely a baptized Neoplatonist. The reasons for the marriage are not hard to discover. There is a great affinity between the basic conceptual structures involved in the two cases. Both Christianity, with its Judaic roots, and Neoplatonism are Absolute theories of the world, i.e. they desire all conceptions to terminate in the notion of something which is absolutely one, absolutely self-sufficient, absolutely unique and also separately a vast gulf of type-difference from anything that lacks these properties. It must not consist of elements which have any separable, independent reality from itself, though it may well have an infinity of inherent aspects or facets which have no separable or independent reality, and it must not depend on the existence of anything separable from, or outside of, itself, and there must be nothing distinct from itself which is not either an inherent aspect of

itself or something which depends wholly on its existence; i.e. it cannot exist alongside of anything else which is neither comprehended in it or dependent upon it. There must further be an infinite difference between itself and whatever is a mere aspect or dependency of itself and such a unique case of all-comprehensive unity must cover all possibilities as well as all actualities: it must accordingly be a unique, all-comprehending, indiscrete, unified, ineliminably existent being, and the only possible case of such. It must lastly be held that Christianity and Neoplatonism desire an Absolute being which will fulfill, either directly or through its dependencies, all the forms of Value and desirability which are recognized as holding for anyone and everyone, and which are in this manner absolute, and which will fulfill all these values and desirabilities in an unsurpassable, supereminent manner and degree.

Now it is plain that the ontology of Neoplatonism is wonderfully accommodated to the Judaic-Christian view of the world. It has a unique single principle on which everything in the world is wholly dependent for its being and properties, which is at once separated by an infinite gulf of difference from everything in the world, and yet endowed with cognitive and dynamic relations, or supereminent forms of such, to everything in that world. It is also ineliminable from all possible as well as from all actual situations, it embodies and incarnates all values and desirabilities that we recognize as mandatory, it has no independent first principles alongside of itself, nor contained as mere elements within itself. And, in addition to its infinite supereminence and aloofness, it has also the infinite willingness to descend into the humblest of existences, and to suffer them to participate in some attenuated excerpt from its infinitely many perfections: it is a fact of its essence to do so, and to do so freely. But in addition to fulfilling all the requirements of Judaic-Christian religiosity very adequately, it also arguably fulfills them supereminently. For the Platonic One or Good is not a supreme instance of eternal, necessary being, nor a supreme instance of Truth and Knowledge, nor a supreme instance of Dynamic Power or of integrated Unity, nor of mathematical measure and harmony nor of perfect circularity or squareness or straightness or twelve-sidedness, nor yet of Justice or Beneficence, or Self-Control, or Courage or any other form of moral excellence, but it is all these excellences *themselves*, as unified specifications of the Unity or Goodness which it itself is.

Such an entity plainly outsoars all its onesided specifications and instances in a quite supereminent manner, and yet it is not alien to or separated from them, for it is of its essence to generate them, whether in timeless or temporal fashion, and to give them all the being and intelligibility and durability and desirability that a limited species or instance can possess. We must not think of it as sitting in forlorn abstraction beyond its specifications and instantiations and cognitive recognitions and enjoyments but as alive and active in them all. As the great Proclus was later to say in his Fifth Century *Elements of Theology* it is of the essence of the Absolute to remain in itself, which constitutes its eternal (ἐνεργεῖα) to go forth from itself into derivative forms which constitute its eternal προόδος and to return to itself from all these derivative forms which constitute its ἐπιστροφή. What philosophical account of ultimate absolute Being can be more Christian? The Neoplatonic Absolute can be identified as redemptive activity, as an act of self-alienation which is also one of redemptive return to self. I am not saying that the Neoplatonists understood all the affinities of their doctrines with Christianity, but these affinities became plain to the best later Christian thinkers. I would note, further, that, while the Neoplatonic Eide and their Principles are in a sense abstract universals, having a content unaffected by the details of their species and instances, they are in another sense fully concrete, since they are inherently active and creative, and cannot be without the specifications which derive from them, and in which they live.

I can now do no more than enumerate a few of the main Christian thinkers who were also Neoplatonists. Let me first mention the great Christian Neoplatonist St. Clement of Alexandria (d. A.D. 215) who turned the Incarnate Logos into a Hierophant as well as a Saviour, and who saw the final goal of psychic life in a Rest in God's All-in-allness where even unity is transcended. I shall also mention Origen, the author of a *Principles*, which starts with a Good-itself or Primal Depth, and then descends to a second God or Logos who fills those depths with the superabundant Eide and with many thinking minds. I may also mention Gregory of Nyssa (d. 394) for a second time, who Neoplatonically conceives the wholly indefinite, unspecific, simple First Principle which ramifies into an indefinitely differentiated Logos on which the real world depends. More eminent than any of these Christian Neoplatonists

is Augustine (d. 430) who teaches that God is beyond all categorization: like certain very superior French hotels He is *hors catégorie*, above category. He is good without having a quality, great without having a quantity, everlasting without having a time, simply substantial without being a substance, omnipresent without occupying a place, and the source of all intelligibility and truth without being either.

Another very fascinating Christian Neoplatonist was the pseudo Dionysius, or Denis, a sixth-century monk who stole his name from a contemporary of St. Paul who is mentioned in the *Acts of the Apostles*, and also stole a great deal of the content of his work on Mystical Theology from the theological writings of the great Athenian Neoplatonist Proclus. Dionysius the Areopagite communicated Neoplatonic ideas to all the medieval philosophers, including Aquinas: one who had heard St. Paul could hardly be in error. I myself think that his work has great brilliance and truth and proves that Providence is willing to work through frauds as well as through honest men.

Another great medieval thinker that was much indebted to Denis is the ninth century John Scotus Erigena. And the great Anselm who devised the Ontological Proof conceived of God in a thoroughly Neoplatonic way, as being Perfection Itself rather than as a supreme instance of perfection. Neoplatonically interpreted, his famous Proof is quite valid. And Aquinas, who at a later date almost always speaks slightly of Plato, and takes over all the banal Aristotelian criticisms, also is manifestly Platonic at many points: that in God Essence and Existence coincide means that God's existence is that of a Platonic Eidos, and that He is the Perfection in which all things inadequately participate rather than a super-perfect individual who just happens to have created everything. I am, however, too timorous to venture far into Thomistic interpretation. My admiration for Thomas is however of the highest. In Post-Renaissance times there has always been a strong vein of Platonism somewhere in philosophy. I should like to say, however, that I consider Hegel as in many respects a dynamic Platonist: many people fail to understand him because they fail to grasp his belief in universals as *essentially active*, and both self-specifying and self-instantiating. And I should also like to stress the essential Platonism of Frege and Russell in their interpretations of mathematics. Russell's *Principles of Mathematics*

is a work that Plato and Proclus would both have understood and admired. Some of Moore's earlier work is also very platonic, as is also that of Alexius Meinong, one of the philosophers on whom I first studiously concentrated.

Modern analysis has been little interested in the ontological profundities of Platonism and Neoplatonism: they have read Plato in the light of Socratic dialectic and of Aristotelian misrepresentation. I would like to change all that. Neoplatonism represents a legitimate development of Platonism, and both are immense speculative world-views which have the greatest relevance for the modern philosophy of Science and for the theology and philosophy of the Christian and other religions.

Boston University

## **Does Neoplatonism have Anything to Say to Post-Modern Spirituality?**

**Paulos Mar Gregorios**

Before I make some preliminary clarifications about my topic, I want to use this occasion to pay my high tribute to one who has striven ceaselessly and tirelessly to make the rich treasures of Neoplatonism open and available to those interested. For a quarter of a century, even before founding the International Society for Neoplatonic Studies in May 1973 at Eastern Kentucky University in Richmond, Kentucky, our friend and leader Prof. R Baine Harris has been convoking conferences and putting out publications on the heritage of Neoplatonism. I am grateful for the privilege of working with him in this noble cause, and of learning from the Neoplatonism scholars of the English speaking world.

### **I. Theoria and Theurgia**

My preliminary remarks about the topic have first to deal with a distinction I make for my own understanding between Plotinus and Later Neoplatonism. The two are divided by such an important feature that I am reluctant to put, for example, Plotinus and Iamblichus in the same basket. The dividing line is Theurgy. Even Plotinus and Porphyry did not have identical views about Theurgy. Porphyry, along with Iamblichus, Proclus and many others not only made free use of Theurgy in their theory and practice, but also developed the theurgical line in a way Plotinus would not have approved. Apart from Augustine, it is Theurgic Neoplatonism and not the Plotinian variety that has been most influential in the Western Tradition. Up to the time of the European Enlightenment, it was Proclus and Iamblichus, rather than Plotinus' non-theurgic Neoplatonism that was at the centre of the European University curriculum.

Let me say a gentle word about Theurgy at this point. Most academic scholars of the West are somewhat allergic to Theurgy, quite understandably. It smacks, in their "scientific" view, of the magico-religious hocus pocus of an infantile humanity which the European Enlightenment and its rationality had finally learned to leave behind in the modern scientific era. Modern Science, in the minds of most of its practitioners, is diametrically opposed to magic and ritual, and would have no concourse with it. They think that magic and ritual are the main superstitions of an un-adult humanity, which they have managed to overcome finally by scientific rationality.

The fact of the matter is this: the view that magic and ritual are without any basis in reality and therefore ineffective, constitutes one of the arrant superstitions of the modern era and its modern science, for which it has absolutely no scientific basis. No understanding of the human tradition seems to the present writer to be anywhere near the truth which holds this superstition of modern science. Whether you are Modern or Post-Modern, you have no option but to recognize that humanity has for the most part of its civilised life found more meaning and fulfilment in significant ritual action, than in the kind of rationality represented by the Modern Science of yesterday and today.

I want only to make that point rather emphatic. If the Modern and Post-Modern Culture of the West and the educated elite of the world want to seek redemption, the first thing they have to do is to go beyond the Modern to seek a deeper understanding of Theurgy in general and of the practices of Theurgy, Tantra, *Puja* and Liturgy in all of the religions of the world. The academic's big mistake, because of an addiction to written elements, concepts, ideas and dogmas, is to seek to understand the spiritual heritage of humanity, divorced from the cultic-ritual element integrally woven into it. The anti-cultic animus of modern scholarship has no philosophical basis, but is a reprehensible and unjustified prejudice inherited from the European Enlightenment and its repudiation of all Tradition, including the so-called religious tradition.<sup>1</sup>

Plotinus held that *Theoria* was the only available means for the Vision of the Divine at its highest level. He opposed *Theurgia* as an alternative to *Theoria*. Not that he did not know what *Theurgia* meant. Porphyry tells us (*vita Plot.* 10) of Plotinus' experience with the Egyptian priest who in Rome offered to show him

(Plotinus) a visible manifestation of the high and noble companion spirit who indwelt Plotinus. Plotinus agreed, and went with others to the Egyptian Temple of Isis in Rome, the only pure or holy place (τόπος καθαρός) in Rome, according to the Egyptian. If Plotinus had no interest in Theurgy, he would not have gone to the Iseum.

In the Iseum, we are told, "at the summons for that *daimon* to manifest itself, a Divinity, not of the rank of the *daimons*, appeared (θεὸν ἐλθεῖν καὶ μὴ τοῦ δαίμονος εἶναι γένος); the Egyptian said: 'Blessed are you, for you have a god and not a subordinate *daimon* for your companion spirit.'"

Obviously this invoking and manifestation of a "god" or "daimon" in the pure temple of Isis in Rome was a theurgical act, involving ritual and sacrifice. The statement of Porphyry about the priest's assistant holding firmly to some birds, which he in his excitement strangled in order to prevent their escape, also confirms the "magico-religious" or theurgical character of the act. Porphyry also tells us that Plotinus regularly and faithfully offered sacrifices on the birthdays of Plato and Socrates. Not the way a Modern or Post-Modern academic or literary writer would celebrate anyone's birthday! We can respectfully ascribe to Professor Armstrong's post-Enlightenment quasi-racist and nearly scientific prejudice, his most biased footnote about this experience of Plotinus in the Iseum having nothing to do with theurgy!

Porphyry also tells us (*vita* 10) that Plotinus actually experienced the black magic practised by his rival/enemy, Olympius the Alexandrian, and felt his limbs convulsing and his body shriveling like "a money-bag pulled tight."

Plotinus' treatise "On our Allotted Guardian Spirit" (III:4—Περὶ τοῦ εἰληχότου ἡμᾶς δαίμονος) explains how this magico-religious ritual and theurgy work: the principle is the interconnectedness of all things in time-space, transmigration of souls being only one of the manifestations of this principle of interconnectedness of all things.

Of those souls in the upper world, some are in the visible region and some outside. Those then, in the visible region are in the sun or in another of the moving stars, and some of them in the sphere of the fixed stars, each according to his rational activity here (ἐκάστη καθ' ὃ λογικῶς ἐνήργησεν ἐνταῦθα). For one must think that there is a κόσμος in our soul, not merely of the intelligible order, but also set up on the form analogous to the soul of the κόσμος; therefore, that just

as the soul of the kosmos is also distributed among the movable and fixed stars according to the variations of its powers, our souls are likewise of the similar form as the all-soul: there is an activity or operation proceeding from each of these powers (in the all-soul as well as in individual soul).

This indeed is the general principle of all magico-religious or ritual-theurgical activity; also from the same source of inspiration is Karl Gustaf Jung's concept of *Synchronicity* which he uses to justify the predictive powers of the Chinese *I Ching*. Moderns and Post-moderns will do well to come to terms with this principle of universal inter-connectedness, in which the human is integrally placed. They would also do well to shed their Enlightenment prejudices against ritual and theurgy and liturgy. These are the symbolic acts that have sustained humanity throughout millennia.

Plotinus knew and experienced Theurgia; but he preferred Theoria as the superior way of Ascent to the Divine. Very few of later Neoplatonists were faithful to this Plotinian prejudice. They themselves practised Theurgia and advocated it. In the history of humanity, *theoria* is the way of the elite, open only to the privileged intellectual aristocracy; the way of the people in all cultures (e.g. the *Bhakti* religions or cults of India) has been *theurgeia* rather than *theoria*. We should keep in mind the caveat that the main reason why post-modern or Aquarian or New Age spirituality is not going to work in the long run, is its overemphasis on *theoria* or "meditation" and its aversion to a deeper kind of knowledge and to cultic experience in general.

Whatever Plotinus might himself have held, it is incontestable that nearly the whole of Neoplatonism is saturated with Theurgy, though Theoria is seldom absent. It is one of the major weaknesses of recent Neoplatonic studies that we have given more prominence to *theoria* than to *theurgia* in our understanding of Neoplatonism. It seems there is a serious lesson here to be learned by those seeking any kind of spirituality that fits the needs of humanity today. *Theoria* may be the special interest of academics; but genuine religion of the people has always been more *theurgia* than *theoria*.<sup>2</sup>

## II. What Constitutes "Modern" and What is Post-Modern?

My second preliminary remark has to do with the content of concepts and movements like "Modern" and "Postmodern."

In order to come to terms with post-modern spirituality we need to know something about the word Modern with or without the prefix "post-" attached to it. Of all those who have written extensively on what constitutes the Modern, Max Weber comes closest to verisimilitude. Unlike less philosophically oriented sociologists like Peter Berger (*Facing up to Modernity*, New York, 1977,) who suggested five phenomena characteristic of Modernity namely Abstraction, Futurity, Individualism, Liberation and Secularisation—Max Weber identified the crux of Modernity in a single phenomenon which occurred during the European Enlightenment—a process which spanned the two centuries from about 1780 to the end of the second World War.

According to Max Weber, cultural modernity has as its central feature, the shift from religion to human rationality, as the unifying framework for integrating our experience of the sum total of reality. Rationality in this context does not mean the largely skill oriented technological or instrumental reason (and science as the foundation for it), but ontological reason, or as Max Weber calls it, "substantive reason," previously expressed in religion and metaphysics. It is this "substantive reason" split into three autonomous regions—Science, Morality and Art—that now takes over from religion, metaphysics and tradition, the function of an integrating framework for all human experience. This is best illustrated by Immanuel Kant's three critiques of Pure Reason, Practical Reason and Judgment.

I would qualify Max Weber's basically correct intuition, and put forward my own intuition of the basic characteristic of the Modern this way: To be modern is primarily to affirm the freedom, autonomy and sovereignty of the human person; hence, secondarily, to be modern is to repudiate totally all external authority—of God or Creator, of religion or revelation, of tradition or metaphysics, so that the human person acknowledges no authority outside of his/her own rationality. Thus, for "Modern Man," the autonomy and sovereignty of the human person is based squarely, not on any religious or divine mandate coming from outside oneself, but strictly by virtue of the fact that the mature human being is self-

sufficient, sovereign and free to act on the authority of his or her own reason alone. And there is no judge above human reason; if it is to be questioned or criticised, it can be only by reason alone. Nothing in the past is normative until examined and appropriated by critical human reason.

"Modern" means affirming the human reason as finally normative for all knowledge, all morality and all art and philosophy, as also for the political economy. If there has to be religion, it has to be, as Kant titled one of his works: *Religion within the Limits of Reason Alone*. *There is nothing higher than the human which lays down norms for action or source for knowledge*. The human being owes his/her being to no one else, is responsible to no Transcendent Agency, but is totally autonomous, and lays down norms by oneself, without the help of any external Agency or Authority. And nothing of the past (Tradition, including mythology, religion, theology, metaphysics, epics and sagas, scriptures), holds authority for human beings until fully tested by critical rationality and appropriated by that critical rationality. In politics too, modern man is a legislator who in his/her freedom can lay down laws for themselves, but will not submit oneself to laws which other people make. Private property, and an independent means of subsistence, are essential for that freedom; without these one would be dependent on others.

Modernity affirms that humanity has become adult now, and should repudiate all that belongs to its childhood and adolescence: cult and worship, priesthood and sacrifice, ritual and dogma, religion and metaphysics. Only Modern Science and the technology based on it can provide "positive knowledge."

The Post-Modern stays on the ground of the basic affirmation of human autonomy and self-sufficiency characteristic of Modernity, but repudiates Modernity's confidence in critical rationality to grasp the truth, and denies the capacity of logic, language and discourse to master the truth and to express it. Positivism and Structuralism, both eminently French in origin, for example, were over-sanguine about the capacity of the human mind to capture the truth in discourse and language. Deconstruction showed the limits of discourse and logic—Derrida, Foucault, Lyotard, and a host of others, mostly from the French intellectual avant-garde, made that clear.

Post-modern does not repudiate the modern as such. As Jean-Francois Lyotard would put it, "The whole idea of postmodernism is perhaps better rethought under the rubric of 'rewriting modernity'." ("Reecrire la modernite" in *L'Inhumain*, Galilee', Paris 1988, pp. 33–34).

Post-modern is a self-correction that happens within the Modern, not opposed to it. It is as much a child of the European Enlightenment as the Modern is. Its distinctiveness is in its repudiation of the power of language, logic and discourse to present the Truth. It offers no norms, certainly not critical rationality, epistemology or system. It offers no definition of either itself or of anything else. It prefers a shift from the pure reason, to imagination and fantasy. It revolts against the tyranny of the European Enlightenment and its freedom-destroying rationality. It advocates less rational-Apollonian, more libidinous-Dionysian, less rule-bound, more non-repressive creativity—in art and architecture, in literature and drama, as well as in thought and expression of every kind. But it stays within the perimeter of the Modern in its basic approach—hardly sensitive to anything non-European, be it the plight of the poor or the menacing growth of injustice in the world, for which the European civilisation is largely responsible. It continues the typical European disdain for non-European cultures as unadult and immature; though occasionally it spots a bit of savour in Nagarjuna or Tao-Te and expresses its own judgment about it. Post-modern is European-White to the core, though feminists and non-Whites often resort to it for support.

### III. And What Is Post-Modern Spirituality?

As far as I know, no particular spiritual movement calls itself by the name "Post-modern Spirituality." What seems to be in vogue is a general trend which has some of the marks of Post-modernity. Some of these marks can be specified:

- a. movement away from all traditional organized religion;
- b. a conception of the universe as permeated by Divine energy, but no belief in a personal God;

- c. an aversion to all ritual and formal worship;
- d. individual choice of meditational techniques and spiritual disciplines;
- e. while disavowing all dogma, still holding to some dogmatic affirmations about the nature of the Soul, the nature of the Universe, and the way to self-realisation or fulfilment;
- f. a general sense that one's own spiritual practice is superior to and supercedes all traditional religious practices of the past.
- g. a general pretension to repudiate all external authority, except perhaps that of a living Master.

This list is by no means meant to be exhaustive, but then post-modernity's characteristic feature is to avoid exhaustive lists, precise definitions, and theoretical systematicness. Post-modern spirituality repudiates all authoritative or normative tradition, makes the individual person the final arbiter of the spirituality he/she would follow, and moves away from science and rationality to intuition, insight and inner illumination. As a revolt from the misuses of traditional religion, post-modern spirituality serves a major didactic function. But as a claimant to the status of the latest universal religion, its drawbacks seem to be many.

#### IV. The Relevance Of Neoplatonism: Positive And Negative

Let us first list some positive orientations that current or non-traditional or post-modern spirituality can receive from the rich Neoplatonic heritage, which Europe so proudly, though not quite honestly, acknowledges to be its own (without a trace of Oriental influence, according to some). In a modern or post-modern world, where Neoplatonism is also rejected as a relic of the repudiated past or the adolescence of European humanity, it will be wise to pay attention to what R.T. Wallis says about the scope of its influence:

A survey of Neoplatonism's influence threatens to become little less than a cultural history of Europe and the Near East down to the Renaissance, and on some points, far beyond. The reason this has not always been recognized is that that influence was often indirect. (*Neoplatonism*, ch. 6, p. 160.)

To me it seems that the best route for Europeans to get out of the cultural bind in which the "tyranny" (Horkheimer-Adorno) of the European Enlightenment has held the Western academic-literary mind prisoner for the past hundred or more years, would be through Neoplatonism first, and then through the World Religions. Neoplatonism, even if not one hundred per cent European, has such a substantial affinity with the pre-Enlightenment European mind, that it can, of course with some effort, but rather easily and without strain, be refamiliarised by that mind.

#### 1. On the Question of the Authority of Tradition

It is one of the follies of the European Enlightenment that it arrogated to itself a non-existent capacity to do without any dependence on Tradition. Hans-Georg Gadamer (*Truth and Method*) and the Hermeneutic School have helped us see clearly how Tradition is the very essence of Science itself, and how no human reflection is possible without Tradition which is an essential element in the shaping of all human minds (*Wirkungsgeschichte*, or the effective history and development of the perceiving mind).

Plotinus, who is rational and discursive in his thinking, is heavily dependent on the Tradition—particularly the Pythagorean-Platonic Tradition. It is because he already knows the truth from the Tradition that he can direct his logic to the fore-known conclusion. Without Plato's authority Plotinus did not seek to function at all.

This combination of heavy dependence on a particular tradition, and the rigorous use of logic to establish its tenets, is what Moderns and Post-Moderns will have to learn. But this means a basic repudiation of the very basis of Modernity and Post-Modernity, namely the refusal to depend on Tradition.

I know of no modern or post-modern spirituality which is not heavily dependent on one tradition or another. It may be the ancient Gnostic Tradition or its modern variants like Theosophy and Anthroposophy; it may be an eclectic amalgam culled from Ancient Yogasastras and Bhakti cult practices; it may be Buddhist

Vipassana or Spanish Mysticism—some element of tradition is bound to be there.

I believe the time has come for Moderns and Post-Moderns to shed their hypocritical pretension not to depend on tradition at all; that is physically impossible, and if they recognize that fact, they will be freer to explore the many traditions of the rich heritage of global humanity and to benefit from such exploration to arrive at a more balanced spirituality. On the question of combining Tradition and Rationality, Neoplatonism offers a first-class model.

## 2. Excessive Reliance on Language, Logic and Discourse.

We should be grateful to the Post-Moderns for having burst one of the big balloons of the pretension of Moderns—the totally foolish idea that we as human subjects can stand outside of reality and view it objectively, “perceiving reality as it actually is.” This is the totally unscientific idea on which modern science was originally based. Today intelligent scientific thinkers would make no such tall claim.

They know that scientific truth is based on inductive reasoning, i.e. arguing from a finite number of experiences under certain given conditions to make a universal “law of nature” statement. New evidence, or new reasoning can always call in question any established truth. Nothing in science is finally proved.

Neither is scientific knowledge non-subjectively objective, as it once thought itself to be. For no perception is possible without subjectivity; the perceiver shapes with one’s sense equipment and mental structure, the perceived object; the observer is thus inescapably part of the observed. What things are “in themselves,” no known mind can perceive.

Michel Foucault in his *Archaeology of Knowledge* accused French Structuralism, and by implication modern science, of a false pursuit of objectivity in discourse. “Discourse is not life” as he says in his concluding paragraph. “Words” and “things”—*Les Mots et les Choses*—are not the same. This “Subject-centered Reason” of Modernity has turned out to be destructive of the human, and Science leads to “oblivion of Being,” as Heidegger argued. Jacques Derrida continues Heidegger’s “philosophical mysticism” and exposes the general unreliability of the written word, and even the spoken word of which it is a symbol. Derrida draws our attention to *Sinn* or “Meaning” which lies beyond and behind all discourse,

written or uttered. And Science has no access to the realm of meaning; it remains at the level of operational truth.

Well, if Moderns had paid some attention to Plotinus, they could have avoided the pitfalls of over-reliance on language and logic and discourse. The Moderns were carried away by a false assumption that language, logic and rationality are what distinguishes humans from animals, and therefore that these constitute the essence of the human. As Plotinus would put it:

Discursive reasoning (λογισμός) is from here below (ἐνταῦθα). It comes to the ψυχή when the soul-body is already in ἀπόρια or unable to see through, and is laden with anxiety and perplexity, in a state of asthenia or powerlessness. (*Enneads* IV:3:18.)

λογισμός or discursive reasoning does not come from the Nous. It comes from our perplexities as we are caught in the web of this world. There, in the Transcendent realm of the νοῦς, there is neither language nor speech, neither logic nor discursive reasoning (IV:3:19):

Neither, in my view, do they need to use speech or voice (οὐδὲ δὴ φωναῖς χρῆσθαι) in that noetic existence, even when having bodies in heaven, they would have no need of speech or discussion of debatable issues like down here. They perform each thing in proper order, according to nature, not giving orders or taking counsel; they would intuitively grasp all mutual communication...before one speaks to another, the latter knows it already.

All classical traditions have known that words and sentences have no capacity to grasp the truth or to express it adequately. In the Modern West there is an obsessive running after grasping the truth and expressing it in word and concept. If the West is on the look-out for a post-modern spirituality, it should go one step beyond the post-Moderns and recognize that word and concept are useful only operationally and perhaps also to point to the truth, but not to grasp it or present it. Post-modernism’s pursuit of the impossible—the vain struggle for conceptually grasping and verbally or by other symbols presenting the Unpresentable—would have been comic were not its results disastrously harmful to humanity.

Neoplatonism holds that the essence of the human is not in linguistic ability or logical skill, and escapes the error of focussing on words and names. Moderns and Post-moderns will do well to pay attention to this ancient insight of the human race.<sup>3</sup>

### V. The Proper Identification and Location of the Human Psyche

Plotinus had a very subtle and sophisticated idea of the human Psyche, which is worth paying attention to, whether you are Modern, Post-Modern or something else. Today when all psychological theory lies in shambles, it is useful to go through Plotinus on this point.

a. It is not the case, in Plotinus, that the soul or psyche is something which human beings "have," as if it were a thing or some property which they own. Neither is the soul a simple substance, like other intelligibles (IV:3:9). The ψυχή or Soul is neither a body (σῶμα οὐδέν—IV:7:2), nor a harmony of non-corporeal entities (οὐδ' ἐν ἄσωμάτοις αὐ ἁρμονίαν); neither is it an entelechy as Aristotle tried to depict it (IV:7:8).

b. Neither does the body-soul composite constitute the human being. The body is not essential to the human being, but a sort of sense-organ of the Psyche, which it forms for itself as it comes into "this" world. The soul is in itself totally free of body—ψυχή καθαρὰ οὐσα σώματος πάντη ἴσχει περὶ αὐτὴν σώματος φύσιν (IV:3:9).

c. The Psyche, not only is not a body, but it does not come out of the noetic realm into a place already existing in the nether world; but as it comes forth it also creates its own place, which did not exist before. (IV:3:9, line 21ff).

d. Plotinus divides the universe into two realms: the one, of things sensible, divisible, dispersible (αἰσθητά, μεριστά, καίσκειαστά), where no part is whole, no part is identical with another, and the part is always less than the whole; in this realm, things have magnitude (μέγεθος) or mass (ὄγκος); each

part occupies its own place, none can be everywhere at once; the Psyche does not belong to this realm, which seems to be the object of study of modern science (measurable masses and magnitudes). The second, opposed to this, is totally incapable of division (οὐδαμῇ μερισμὸν δεχομένη), no parts, not partible (ἀμερῆς τε καὶ ἀμέριστος), no extendedness in space, (διάστημα οὐδέν), not conceptualisable (οὐδέν δι' ἐπινόιας δεχομένη); no parts, no need of place to exist, not located in any other being partwise or wholewise; it rides on all beings at once, always having its being in itself.

The Psyche before its descent into the world, was of this realm. But in its descent, the Psyche becomes a third category of being, simultaneously divisible and indivisible, in order to be able to give form to different bodies. Quoting Plato's *Timaeus* 35A 1-4, where he says that the Demiourgos "mixed a third form of being from both, from the indivisible which is always in the same state, and that which becomes divisible in the sphere of bodies," Plotinus posits a third realm of being to which the embodied soul, or rather the ensouled body, belongs. (ἢ δ' ὁμοῦ μεριστῇ τε καὶ ἀμέριστος φύσιν, ἣν δὲ ψυχὴν εἶναι φασί). The soul is divine (θεῖον) and marvelous (θαυμαστόν), something superior to other things (καὶ τῶν ὑπὲρ τὰ χρήματα φύσεων) (IV:1(2)1).

e. Souls are thus one any many at the same time; in its original noetic existence, it is only one; in its bodily existence the one Psyche becomes many. The embodied Soul thus becomes an intermediary between the primal/indivisible and the divisible/corporeal. Its true home is in the κόσμος νοητός, and *theonous* is the noblest of the beings in this realm; the Soul also truly belongs to this κόσμος νοητός, where the *Nous* presides.

f. This universe of ours, formed by the All-Soul,—this τοῦ παντός ψυχῇ was always there when the universe was—is a sort of beautiful and richly furnished house (οἶκος τις καλὸς καὶ ποικίλος), not entirely cut off from the All-Soul, but not sharing its nature (οὐδ' αὐ ἐκοίνωσεν αὐτὸν αὐτῇ). The human soul, coming into this beautiful universe, makes alive that which is not alive by itself, lending it life and a vehicle or ὄχημα for that life.

Whether we agree with Plotinus' depiction of the soul or not, we have to concede that it is a rather original and noble conception. It is far more sophisticated a notion of the human psyche than Freud, for example, gave us. Of course, the post-moderns have given up on Freud, as they ought to have from the beginning. But do post-Moderns have a notion of the human psyche? Not only do they not have one of their own, but they would question the legitimacy of any other conception of the psyche.

This is a special characteristic of the Western intellectual tradition as it comes out of the Enlightenment and its frantic quest for objective and verifiable reality. The western tradition has oscillated between the two opposed possibilities of grounding certainty in the objective, and seeking personal-existential truth in the subjective. After the Deconstructionist experience, most post-moderns would admit that there is no way of grounding the truth either in the objective or in the subjective. The subject, or psyche, as the reliable ground of truth-certainty, does not work. Post-moderns therefore disdain any attempt to grasp truth and ground its certainty in the subjective psyche. Where else should they ground it? The answer is—nowhere. It is a counsel of despair, of total frustration in the intellectual quest for truth, a stifled cry of agony and a refusal to look to the Tradition or to the Transcendent for some light.

It is in this context that the locating of the Psyche in Neoplatonism becomes particularly relevant for Western man. After all Neoplatonism boldly (but without basis), claims to be a pure European creation. Then why not become acquainted with the Neoplatonist tradition before rejecting it? Maybe there are indications in that tradition as to what kind of a gestalt of the human psyche they should generally adopt; for it is impossible to get along without one; if one does not consciously adopt a working gestalt of the human psyche, one is bound to be found operating on the basis simply of unexamined notions.

#### VI. Towards A Conclusion:

#### *The Plotinian Gestalt of the Human Psyche as a possible Guide to Our Thinking and Our Spirituality Today*

This brief paper can only point to some of the features of the Plotinian depiction of the human psyche, which could be useful in fundamentally revising some of the Modern conceptions and Post-modern non-conceptions about the nature of the human psyche.

a. The human psyche or soul is a double entity, on the one hand participating in the world of things by animating the inanimate, by giving life to that which is not alive, and thus creating life and self-propelled thought and movement in this world; on the other hand, it is a sort of alien in this world with its true home in another realm, the world where the *Nous* holds everything together in perfect unity. The human psyche thus is a native of the κόσμος νοητός, temporarily sojourning in the world of things by taking a body as its sense organ for this world, so to speak, while at the same time seeking a repatriation to its home country.

Moderns would do well to abandon their simplistic notions of the human soul as a pure native of this world, concerned only about the world of things, as revealed by science and made manipulable by technology. Once this transcendent dimension of the human soul is recognized, it becomes possible for modern civilisation to see how superficial and trivial, despite their gigantic and seemingly impressive achievements, modern science and the technology based on it are—dealing only with the things that pertain to the lower side of the human psyche. Marx's "instrumental reason," which creates only the physical and social sciences, all based on a denial of transcendence, can only deal with this world-manipulating aspect of human reason and existence. What Max Horkheimer and Theodor Adorno of the Frankfurt School called "ontological reason" is the better part of the human psyche; its quest and questions find no response in science and technology. If Moderns or Post-moderns really recognize this fact, their approach to knowledge and wisdom would be radically revolutionised.

b. The human psyche is not "located" in the body as if in a place; the soul has neither measurement nor magnitude, mass or volume and it does not occupy and space (IV:3:9 ff). It does not, in part or as a whole, "reside in the body" (IV:3:20). Soul is not, for Plotinus, present in something as, for example, form (εἶδος) in matter (ὑλη). Because by definition form in matter is inseparable from it; the soul is separable from the body. Plotinus dissociates himself not only from the Thomistic line almost identifying the human psyche with the human intellect; he goes further to deny even Plato's dictum in *Timaeus* 44D-E that the human intelligence was located in the head.

The present understanding of Moderns about the body-soul relationship is too naive—as a simple set of coexisting realities, mutually interpenetrating. The psyche in Plotinus is more tangential to the body, using the body as its instrument or ὄργανον. (πᾶν τὸ σῶμα ὄργανον τῇ ψυχῇ εἶναι IV.3.23,8–9). The Unity of all souls, undivided and indivisible, and yet appearing partitioned in bodies, is something to which Moderns should pay some pointed attention. As Plato's Socrates says in *Republic* Bk VI (498c ff):

They have never seen that of which we are now speaking realized; they have seen only a conventional imitation of philosophy, consisting of words artificially brought together, not like ours with a natural consistency and unity...by every means in their power seeking after the truth for the sake of knowledge,...they look coldly on the subtleties of controversy, of which the end is opinion and strife.

It is this Socratic wisdom that moderns and post-moderns lack; their thought always ends up in opinion and strife, but not in the wisdom of Truth experienced. Socrates speaks in *Meno* 99–100 about the gift of virtue as "an instinct given by God to the virtuous...not accompanied by reason." It is learned only by discipline and not necessarily by knowledge; it is that quest to which Plotinus referred in his famous last words as cited by Porphyry (*Vita* 2:26–27) to seek to lead the in-you God to the in-all God.

*Plotinus sees the human Psyche as in itself Transcendent, having dimensions that go far beyond the body into the Whole. He also locates it, not as a stationary entity born in this world and resident here, but as in the middle of a process. As Proclus later*

*was to put it more clearly, the human Soul in its original existence, remains unmoved, abiding in the Principium, the μονή as he calls it—i.e. Plotinus' undivided, indivisible, timeless, spaceless, τό ἐν; from there it proceeds to the Nous and to the Psyche in a πρόοδος, only to find its way back home through the ἐπιστροφή or the Return to Source. The Soul is thus a migrant from the One, seeking its return to the Same One. In that process, the descended soul uses the body as its sense-instrument in this world.*

For Plotinus, the Soul has three dimensions as he puts it in his treatise *Against the Gnostics* (II:9:2):

Of our Soul, part is eternally with those, part with these, and in between a part in the middle (ψυχῆς δὲ ἡμῶν τὸ μὲν αἰεὶ πρὸς ἐκείνοις, τὸ δὲ πρὸς ταῦτα ἔχειν, τὸ δ' ἐν μέσῳ τούτων).

The middle part is the διάνοια or "mentation through," moving beyond the world of sense-experience or αἰσθήσις. That is Ontological Reason, trying to break through sense experience to the beyond. This dianoa is above the aesthetic, but below the nous, the middle aspect of our *psyche* (V:3:3 ff—χείρονος μὲν τῆς αἰσθήσεως, βελτίονος δὲ τοῦ νοῦ, I.39–40).

It is this aspect of the Soul's origin and descent by πρόοδος from the Beyond, and the disciplined journey or ἐπιστροφή to the Beyond, breaking through all academic niceties and literary flourish, that no post-modern or Modern Spirituality can afford to neglect or overlook. In reflecting on that principal aspect of the Soul, Neoplatonism, at least for the West, can be a helpful guide. Provided, of course that our Neoplatonism studies give more importance to Neoplatonic discipline and theurgy, than to doctrinal subtleties. The great task is to wake up from our dreams and illusions, to shed false notions about reason's omniscience, to realize in actuality one's own true being in the One.

Syrian Orthodox Metropolitan of Delhi

#### NOTES

1. None of the Ancient Civilisations, Indian, Chinese or Greek made the distinction, which the children of the Enlightenment seem to take for granted, between "religion" and "philosophy." The distinction did not begin in the Modern Period, but can be attributed to one of the most

pernicious dualisms with which Thomistic thought has operated—that between “natural philosophy” to be studied by the unaided human reason on the one hand, and on the other “theology” or “revealed religion” which can only be “supernaturally” given to human beings. Such a distinction between two realms, one natural and the other supernatural, between “Nature” and “Grace,” between “philosophy” and “theology” is alien to Greek thought, as well as to pre-Thomistic systems in the West. No such distinction, not even the concept “supernatural,” can be traced in the Eastern Classical Patristic thought. It was the European Enlightenment that went further than Thomistic thought in repudiating something they themselves created, called “religion” as one department of life, as belonging to the infancy of humanity. Neoplatonism did not make such a distinction between εὐσεβεία and φιλοσοφία.

2. Theurgia as a Greek notion, has its parallels in other religions. The most noteworthy is one of the many “isms” which the Nineteenth Century’s Enlightenment fictitiously created—labeled *Tantrism*. In India, we have no such “ism” or its equivalent; it is a pure western creation; what we have is a *Tantrasastra*, which means the teaching of the *tantras*. Tantra in Sanskrit is a warp or loom; it came to mean all kinds of manuals and treatises, especially in the *avaidika* or non-Vedic tradition. The Jains call it *Mantrasastra* or the science of achieving results through sacrificial or cultic mantras or incantations. My own definition of Mantra or Tantra is “ritual-cultic use of the human and divine will and word to bend cosmic energy or *sakti* to the attainment of one’s chosen ends.” This is the major part of people’s religion in India—be it Saivite or Vaishnavite, Buddhist or Jain, Vedic or Upanisadic, Purva Mimamsa or Uttara Mimamsa, Aranyakas or Brahmanas, or even a treatise on Temple Architecture or on the Healing Arts. Yoga, Kundalini, and Mandalas all belong to this Mantra-Tantra; there is no separable aspect of Indian or Tibetan Religion which can be labeled *Tantrism* as western scholars misleadingly argue.
3. Perfect Logic and total Omniscience are not available even to the gods, as Alexander Aphrodisias taught, developing an Aristotelian doctrine. True and false are accidental and not absolute properties of statements. On this see Mario Mignucci (University of Padua), “Logic and Omniscience: Alexander of Aphrodisias and Proclus” in Julia Annas (ed), *Oxford Studies in Ancient Philosophy*, Vol. III, Clarendon Press, Oxford, 1985 pp. 219–246.

## Neoplatonism and Contemporary Theories of Mysticism

Parviz Morewedge

### I. Platonic and Neoplatonic Sources of Mysticism

While many contemporary scholars observe an essential link between Neoplatonism and mysticism (both monistic and theistic types) they disagree on compatibility between monism and theism. This study proffers a new refinement of monistic mysticism attempting to clarify mystical dimensions of Neoplatonism as a specific category of non-theistic monism.<sup>1</sup>

The search for the begetter of mysticism is brief. Most investigators point to Platonism—of all forms, especially its Neoplatonic variations—as begetter of mysticism in the West and the Near East. Take a typical notion: the notion of the “mystics’ way,” the very core of the so-called “Self-realization ethics.” R. Otto, who expresses the views of many, does not take mysticism as a metaphysics but as a doctrine of salvation characterized by “the inward way,” and “the way of unity.”<sup>2</sup> Otto’s claim is corroborated by the concept of the way (*ṭarīqa*) in Islamic mystical (sufic) literature; the mystic is referred to as the traveler (*sālik*, of the mystical path); mysticism is a series of phenomenological transformations through the stations (*maqāmāt*, due to external efforts) and the intentional state (*ahwāl*, due to degrees of authentic exposures). In sufism, gnosis (*maʿrifa*) is explained not in terms of knowledge (*ʿilm*) of concepts nor sense data, but a series of revelations (*kashfah*) where the mystic’s entire world-perspective is sequentially modified until mystical union is achieved. What is the source of this doctrine? Without postulating causal connections, one observes two prototypes of this sense of knowledge in the Platonic corpus: “the allegory of the cave,” in the *Republic* (514 A–521 B) and as D. E. Anderson has observed, the ladder of ascent in the *Symposium* (209 E–212 C).<sup>3</sup> Note the generic use of

"mysticism" in our discussion, which includes but extends beyond "theistic," types of mysticism. Classical scholars of Plato agree. In this tenor, F. M. Cornford takes Plato's demiurge not as the object of worship, the God of the Bible, or a religious figure. Cornford sees "no justification for the suggestion, conveyed by 'God,' with the capital letter, that Plato was a monotheist." J. Burnet agrees: "We must not assume...that Plato meant by God what a modern theist would mean...he is a Mind (*voûs*)...but not the supreme being," as God cannot be identified with the Good which is a form and not a soul. Plato's work as the prototype of the framework for meta-mysticism is upheld by a large number of "the friends of the forms," and they come in every nationality—from al-Suhrawardi (d. 1191) who refers to the Divine Plato to A. N. Whitehead (d. 1947) who saw all subsequent philosophy as a series of footnotes to Plato's texts. But it is Plotinus who is regarded as the major philosopher of mysticism. Plato is the seed; Plotinus is the flower. Plato's corpus is pregnant with many mystical notions, but it is in the *Enneads* where Plotinus gives birth to many of them and raises them as sturdy offspring.

Let me point to another central doctrine of mysticism, that is the Absolute (*haqq-I muflaq*). Plato's ultimate beings are: the normative Form of the Good (*τὸ ἀγαθόν*) (cf., *Republic* 508 C–509 B) who begets other forms and the demiurge (*δημιουργός*) (cf., *Timaeus* 30 C–31 B), the maker of the universe as a living thing and the craftsman-artist in the cosmogony. Instead of these, the Plotinian system has a single Absolute One (*τὸ ἓν*) which is both the Good as well as the major figure in cosmogony. But we need to look further as the Neoplatonic One is beyond "being," or "supra-being." In fact we do have a different system or even an original system. As stated by R. A. Gilbert, "he [Plotinus] was the first to set out clearly the idea of the Absolute (the One or the Good)."<sup>6</sup> It is this Plotinus' Absolute, (which is also the Good) and not the demiurge of Plato which is the most important model for mysticism. For many, the mark of experiential mysticism is the urge to encounter some sense of union or connection with the Absolute; this is true especially in the "rational mysticism" of W. Kingsland and the "interpretative of mysticism," of W. T. Stace.<sup>7</sup> In several other topics, Plotinus is his own person; consider, in Plotinus' cognitive aesthetics, the distinction between the beautiful and the Good, and the dearth of political philosophy and physics in Plotinus

in contrast to the extensive treatment of these topics by Plato. In my opinion, even though these reasons are sufficient for the primacy of Plotinus in mysticism, the most important cause deals with people's unexamined personal convictions—namely their religions. This is the reason for the primacy of Plotinus in his direct and undeniable influence on the mystical dimensions of the monotheistic traditions, especially Christianity. I believe that religiously inclined scholars are attracted to Neoplatonism, partially because of its affinity with the mystical dimensions of monotheism. Recall that Findlay's wonderful article, "Why Christians Should be Platonists," was not called "Why Platonists should be Christians!"<sup>8</sup> In sum, I agree with many like R. H. Jones who consider Plotinus' philosophy as an original system in spite of its Platonic background.<sup>9</sup>

## II. Neoplatonism and Theism

W. R. (Dean) Inge, expressing a consensus on Plotinus' influence on Christianity, remarks, "Plotinian mysticism...closely resembles the records of the Christian mystics, and indeed all mystics, whatever their creed, date or nationality."<sup>10</sup> He calls Plato the father of European mysticism and points out that "Justin Martyr claims Plato (with Heraclitus and Socrates) as a Christian before Christ; Athenagoras calls him the best of the forerunners of Christianity, and Clement of Alexandria regards the Gospels as perfected Neoplatonism."<sup>11</sup>

F. C. Happold first identifies Neoplatonism as the synthesis of Greek and Oriental philosophy. Pointing to philosophical systems such as that *The Mystical Theology* of Dionysius the Areopagite, he notes "As a result of fusion of Christian and Neoplatonist ideas in the early centuries of the Christian era, a system of so-called mystical theology came into existence which was one of the main foundations of Christian mysticism."<sup>12</sup> Steven Katz holds that the "unitive Christian mystics are invariably those such as Eckhart, Tauler, and Suso, who have on Plotinus, Dionysius the Areopagite, i.e. the strong Neoplatonic current in Christian intellectual history."<sup>13</sup> Another major investigator in Christian mysticism, R. C. Zaehner, who in his *Zen, Drugs and Mysticism*, states, "The main-stream of Christian mysticism, for instance is probably more influenced by Neoplatonism and Pseudo-Dionysius...than it is by

the *New Testament*."<sup>14</sup> Jewish mysticism displays the same influence. For example, G. G. Scholem states that Maimonides' "mystical inclination turns him in the direction of Neoplatonism. There can be no doubt that he read [the Neoplatonic text which was known as] 'The Theology of Aristotle.'"<sup>15</sup> G. G. Scholem traces Jewish mysticism's debt to Neoplatonism in later thinkers such as Abraham Cohen Herrera of Florence (d. 1635–39).<sup>16</sup> M. Idel states that "Another source of motifs, concepts, and terms...to Jewish medieval mysticism was Neoplatonism...[T]he deep religious significance of this form of philosophy has already been recognized in the cases of Islamic and Christian mysticism, and Kabbalah fully shares with these mystical systems a deep interest in Neoplatonism."<sup>17</sup> I. Husik notes that, "The only source of Maimonides' ideas is to be sought in Neoplatonism..."<sup>18</sup> T. M. Rudavsky, in her analysis of the Jewish philosopher, Maimonides, notes, "echoing Plotinus, Maimonides characterizes matter as the 'a nonexistent,' 'nothing which is not nothingness.'"<sup>19</sup> In case of Islamic philosophy, I concur with M. Fakhry in his claim that Neoplatonism found in the so-called *Theologia Aristotelis* influenced Muslim thinkers more than the works of Aristotle.<sup>20</sup> With regards to Islam, I have pointed out a number of links between Neoplatonic and Islamic mysticism in several writings; for example, most Muslim philosopher-mystics abandoned the creation theory of orthodoxy for the Neoplatonic type of emanation, because mystical union can be formulated in process metaphysics and not in a substance-event metaphysics.<sup>21</sup> Is there a limit to Neoplatonic influence? No limit, or only a few, according to some contemporary scholars. In this same vein, R. T. Wallis notes:

...post Cartesian Continental thought has retained a substantial Neoplatonic component. Thus in the seventeenth century Spinoza's monism and Leibniz's monadism represent different developments of a common Neoplatonic substratum, while in the Nineteenth century Schelling's Plotinian-influenced thought counterpoints Hegel's more Procline system. [Moreover] Bergson...restates Plotinus' philosophy of the soul....<sup>22</sup>

We need to probe further into three refinements of this relationship, namely: (a) salient features of mysticism relevant to Neoplatonism; (b) the sense in which Neoplatonism is mystical; and

(c) further clarification of Neoplatonism by examples of monisms which are mystical but not Neoplatonic.

### III. Basic Typologies in Contemporary Scholarship of Mysticism

Clarifying the basics of contemporary typologies, I construe distinctions between theistic, natural and the monistic dimensions of some mystical systems.

#### 1. Some Contemporary Impressions on Zaehner's Typology

As the most significant contemporary typology, Zaehner's theories have received highly varied reactions. On the one extreme, John M. Rist writes, "We shall take as guide R.C. Zaehner's *Mysticism: Sacred and Profane*, a book whose importance for the study of mysticism is so great as to make much of what has previously been written look like pointless maundering."<sup>23</sup> On the other extreme, F. Staal accuses Zaehner of both religious bias and emotionalism. As Staal writes, "Zaehner's approach contributes little to the serious study of mysticism. It does not establish a position from which one can do more than scratch the surface of Hindu and Muslim forms of mysticism."<sup>24</sup> Also W.T. Stace, proffers a distinction between "the experience of mysticism," and "the interpretation of that experience," and claims that "in my opinion, he [Zaehner] was gravely misled by his failure to hold the distinction in mind."<sup>25</sup> Many contemporary thinkers such as R. T. Wallis, agree with Stace that Zaehner confuses categories of interpretation and experience.<sup>26</sup> A critical analysis of Zaehner's views with respect to mysticism and Neoplatonism has been stated in a previous essay.<sup>27</sup> Here we focus on those elements of Zaehner's typology relevant to this essay.

#### 2. Fundamentals of Zaehner's Typology

Proffering a theistic model for mysticism, Zaehner criticizes "nature mystics," who, like Spinoza, equate "nature" with "God"; Zaehner claims "...it is an observable fact that in Nature there is neither morality no charity nor even common decency. God, then, is reduced to the sum-total of all natural impulses in which the terms 'good' and 'evil' have no meaning. Such a God is subhuman,

a god fit for animals, not for rational creatures."<sup>29</sup> Nature mystics, for him, construe a single unity out of distinct constituents of nature and in exalted moments see themselves as being one with Nature and beyond good and evil.<sup>30</sup> This projection of a unity is understandable as all mystics seek a unity to combat alienation. Nature mystics reach this feeling of unity by their monistic integration of the self with the rest of nature and not with a supra nature religious entity. For Zaehner such a unity is mistaken for two reasons. First, nature contains morally negative elements; second, monism misconstrues the true nature of persons and alienates them from their divine element. The true path for Zaehner is the "theistic and dualistic" type of mysticism by those who are "abhorred" by the doctrine of nature mystic. Theistic mystics attempt to surrender worthy dimensions of themselves to a transcendent God; this is not achieved by an integration but by an "isolation" of the self-soul from ephemeral nature. In defense of the theistic mysticism, he identifies the cardinal mistake of the nature mystic as being "deceived by the mere sensation of union or of unity into the belief that the object of such a union must be the same."<sup>30</sup> By knowing their limits, theists are dualists who recognize God as an entity transcending creature; on the other hand an absolute Monist denies the existence of the real God, because the proper monotheistic God is a transcendent being. "Monism in practice, means the isolation of the soul from all that is other than itself."<sup>31</sup> Zaehner observes a deep personal intimacy between believers and their perspectives of God. Analogies used by Zaehner reveal the ethos of his vision of "good" mysticism: "The goal is isolation...mean[ing] the isolation of what Christians call man's immortal soul from all its purely psycho-physical adjuncts....The soul in such a state might be compared to that of a new born child; it has reverted to original innocence in which there is neither good nor evil."<sup>32</sup> A more revealing analogy is expressed as follows: "The soul, then, at this stage is comparable to a virgin who falls violently in love and desires nothing so much as to be 'ravished,' 'annihilated' and assimilated into the beloved... the raptures of the theistic mystic are closely akin to the transport of sexual union, the soul playing the part of the female and God appearing as the male."<sup>33</sup> A paradigmatic case of salvation by isolation is found in the Virgin Mary, the sinless holy figure, transcending the standard Jungian image of woman as a depiction of the fourth element (represented by matter).

In summary, Zaehner's typology points to two types of mysticism relevant to our analysis: a theistic isolation type of mysticism that accepts the transcendent God with whom the mystic cannot be identified; and nature mystics, for whom the path of self realization is via integration of the self into nature. Zaehner's contribution to theoretical analysis of mysticism is commendable, for even his critics recognize the use of his sharp distinction between religious and non-religious types of mysticism.

### 3. Stoeber's "Theo-monism" and Criticism of Zaehner

In a brilliant move, Michael Stoeber rejects the theist-monist distinction in Zaehner's typology and introduces the new typology of "theo-monism":

Phenomenologically...[theo-monism is expressed] in terms of the mystical self[s] transformation to divinity. The monistic experience involves a movement towards realization of primary-self, an essence that has its grounding in the very non-dual, static and impersonal essence of a personal Divine. The mystic identifies monistically with the apophatic Source; and this essential association is a purifying movement wherein the mystic becomes a unique medium of elements and energies of the catastrophic Divine. In experiencing the non-dual, static and impersonal Source, the mystic naturally comes to express distinctively and actively aspects of the personal Divine.<sup>34</sup>

Stoeber moves beyond the theist/non-theist distinction to a phenomenal sense of identity: "In theistic mysticism some sense of identity remains in a powerfully affective experience which is expressed in strikingly personal terms...[non-theistic] monistic experiences involve a loss of duality or differentiation which rules out personal experiences all together."<sup>35</sup> Stoeber speaks of "an identification with the Divine," and articulates it by saying that "the Divine expresses both impersonal and personal elements, thus bridging the monotheistic and theistic gap."<sup>36</sup> In a similar theme, C. Hartshorne holds the distinction between "the abstract, eternal, necessary essence of deity and the concrete, contingent, partly temporal Divine reality." Nevertheless, "there are ways of making somewhat more detectable the presence of Deity in all experience," one way would be to go along with Whitehead to say "that any direct data of experience are simultaneous with the experience for which they are data, or by which they are apprehended."<sup>37</sup> Stace

specifically assigns this type of mysticism to a specific kind, as he notes that, "According to our view, the essence of introvertive [mystical] experience is the undifferentiated unity, and 'union with God,' [for Western religions, especially Christianity] is only one possible interpretation of it."<sup>38</sup> What is the underlying emphasis here? The answer lies in the affinity between persons and God, as Inge corroborates:

Religious Mysticism may be defined as the attempt to realize the presence of the living God in the soul and in nature, or, more generally, as the attempt to realize, in thought and feeling, the immanence of the temporal in the eternal and of the eternal in the temporal.<sup>39</sup>

The affinity between persons and God is asserted in most sacred texts of monotheism such as the Qur'an: "We are nearer to Him, than His own jugular vein."<sup>40</sup> The model of religious theism proffered by Stoeber does not account for a symmetric union between persons and God, nor for an annihilation of persons in God. It is an epistemic pose, or a recognition that the inner essence (what the Muslims call *dhāt*) is grounded in the Divine love. I agree with Stoeber that mystics in their devotional ethos, such as prayer, seek to overcome their alienation as an ephemeral entity and relate to the eternal God. But from a non-phenomenological perspective, the dualism remains, because in monotheistic systems, persons and God remain separate. No one can remain a monotheist and claim a symmetrical identity with God. The term "identification" in its usage as related to "Union" has many senses. For example, a piece of ice may melt in water and unite with the water. Here the ice melts and the water remains relatively unchanged. By contrast, if blue paint and yellow paint merge, they unite in a green color and lose their original identities. A male and a female may marry and unite through a child who is common to both of them, while they remain separate entities. A wave in an ocean unites with the rest of the ocean as the ocean transforms itself through reconfiguration. The last example may be an illustration of Spinoza's "extroverted" mysticism in which monism is preserved; but none of the above senses of identification matches the theistic sense. Why? Supposedly, God is essentially distinct from his creatures; thus no identification or union is possible where God's constituents and a persons' constituents merge. It is in this sense that C. Smith notes:

"Mysticism as understood by Eckhart is not necessarily a matter of ecstasy or bliss...[but] a total surrendering of self and self-will, the creation within oneself of a certain void or nothingness."<sup>41</sup> We have pointed out in another essay how Descartes' ontological argument can be interpreted not as a static logical argument, but as a process of phases of increasing authenticity between the apparent and the inner reality.<sup>42</sup> At first Descartes knows that if he asserts that he thinks, then he must exist as a mind; further reflections reveal the finite nature of his self-mind which can only be actualized on the grounds of an infinite being. The epistemic priority of the self as a constituent of a larger Divine-infinite system does not make the Cartesian system ontologically a monistic system. The continuum from self to God does not make the self infinite. R. Carnap classifies this type of mistake as psychologism in logic, which is a variation of Plato's objection to the sophists' position of identifying perception/belief with knowledge; Carnap states that this type of mistake takes place "...when the problems themselves are of an objective nature, but the description to which the author intends to give...[is] framed in subjectivist, psychological terms..."<sup>43</sup> Stoeber's insight is correct as long as he is classifying "monism" in a phenomenological language.

An interesting approach to this problem is found in an interpretation of ibn 'Arabi's mystical system which is aware of the distinction between the transcendent and the phenomenal senses of the Divine. Suppose two realms are postulated: Reality [*aletheia*, *haqq*] in itself transcends the phenomenological realm of the believer and the monadic mind-dependent phenomenon world (*dhinī*) of the mystic, which one takes God to be an appearance of Reality is so far as one can apprehend. The intimacy (*uns*) which is felt by the mystic is not his/her identification with the Absolute, but with a God revealed by phenomenological icons such as the ninety divine names.<sup>44</sup>

The self-soul in theistic mysticism variations of Zaehner and Stoeber teaches the absolute supremacy and the alienation of God—a God who tests Abraham by requesting the sacrifice of his son. This is very different from the Plotinian soul-self which ascends towards the One; as Plotinus states, "Since the soul is so honorable and divine a thing, be sure already that you can attain God by reason of its being of this kind, and with this as your motive ascend to him." [V.I., 3.1–2].

## IV. Theistic Mysticism and Neoplatonism

Our preliminary step in refinement of "monism," is to present a distinction between it and "theistic mysticism."

## 1. Monotheistic mysticism

Following Carnapian methodology, let us clarify our explicandum of "monotheistic mysticism" using a set of conditions distinguishing it from other senses of mysticism in philosophical discourse:<sup>45</sup>

(i) *Traditional divine predicates*: The monotheistic God has ■ mind, a free will and the power to create the world: an entity to whom creatures can pray. Note that it would be meaningless to pray to nature, the Form of the Good, Aristotle's first mover, or the One Plotinus.

(ii) *The absolute transcendence of God*: The doctrine of God's "transcendence" means that it is possible that God exists while the world does not exist. So, creation takes place not by necessity but through God's grace. R. Otto notes on this topic, that "All religion, indeed, seeks the transcendent, and salvation in the transcendent...[Thus] there remains always the chasm between creator and created."<sup>46</sup>

(iii) *Impossibility of ontic unity between God and persons*: God is essentially different from persons. For any person to claim "I am God" is always false.

(iv) *Mystical proximity in the model of the mathematical "limit"*: In this model, persons are construed as processes and not substances. Analogous to the mathematical notion of "a limit," as a person x partakes of mystical states, distinctions between person x's experience and God-like experience decreases towards 'O' without ever becoming 'O'.

For any person x, as [x approaches the mystical], then [x approaches the God like, or having a God like perspective]. Embracing mystical states persists not because of x's power alone, but also by God's love, grace, etc.

(v) *Normative bifurcation of the world into two castes*: Ethical grace can be achieved while the believer is in "ontologically lower state." Persons are morally and spiritually inferior to God, prophets, angels, etc. There is always "otherness" between them and the heavenly immortals. A person may be named as the slave of God, for example 'Abullah, but God is always the Lord of the Heavens and the Earth.

(vi) *Concrete dimension of persons-God encounter*. In theistic mysticism, the relation between persons and God is closer than the relationship between persons and themselves, because God is taken to be the inner-essence (*dhāt*) of persons in three senses: the remote efficient cause, because God is the creator; the essence as the cause of persistence of the unity of the entity (which means that a person exists by God's grace); and the final cause, or the cause of completion (*kamāl, telos*). In a sense, persons do not belong to themselves, but belong to the Divine. Monotheism rejects the so-called process of "simplification," in the ascent of the soul towards the One.

## 2. Some differences between monotheism and monism: Neoplatonic and Avicennian Monism.

Outside the rubric of western scholarship on Neoplatonism lies a vast domain of Neoplatonic work in the Near East, especially in the Islamic area.<sup>47</sup> This section focuses on the work of Plotinus as well as Avicenna, who followed Plotinus in emanationism, but differed from his system in many ways. Neither the classical Neoplatonic position nor any one of its major developments such as Islamic Neoplatonism is compatible with the theistic notion of God, at least in the following topics:

(i) Plotinus' One is not an entity in the sense of Aristotle's immaterial substance (*ousia*); nor it is a monotheistic God who according to Judaism made a covenant with a man (who according to Christianity had a son and according to Islam sent an angel (Gabriel) to give moral messages to a man (Prophet Muhammad) in a cave. These depictions would be meaningless if we substituted "God," with the "One" of Neoplatonism. Plotinus states that "The One is all things and not a single one

of them...it's the principle (*arche*) of all things and the generator of [entities]" [V.2., I., 1-3]. "The First, is beyond (supra) being, and does not think" [*Enneads*, III.8, 1]; the First as the Good is beyond thinking [*Enneads*, III.9, 2-5]. In the world of Plotinus and Avicenna the ultimate being is not an individual existent but an imminent begetter, a ground of existents and the beholder [*dāranda*] of the world and not an existent substance (*ousia*, *jawhar*).<sup>48</sup>

(ii) One needs not to express appreciation to God. Thus according to Plato's *Euthyphro*, one need not to pray to the Gods, nor fear them. Unlike the monotheistic God, the One of Plotinus does not have love, grace, self-consciousness or free will. The One of Plotinus does not bring floods, does not kill the first-born of the Egyptians to tilt his power in a dispute between believers and non-believers; nor is he instrumental in sending the believers into the heavens and the sinners into hell. It is an entity, totally different from the monotheistic God shared by the Jews, Christians and Muslims.

(iii) The ultimate being of Plotinus or Avicenna does not create the world out of nothing by His grace. The world emanates by Necessity; it could not have been otherwise. H. A. Wolfson observed correctly that since Philo believed in the scriptures, Philo parted from Plato when the doctrines of the Greek philosophers were against religion; whereas Plato's cosmogony takes place by necessity, "Philo, following the scriptural conception of God as an all powerful free agent "...takes the will [of God to mean that] he could have either created the world or created another kind of world...[and] can destroy the world."<sup>49</sup> In Avicenna's system emanation of the world is implied from the "most perfect" (*fauq al-tamām*) feature of the Necessary Existent (*al-wājib al-wujūd*). Not only is the latter an existent by itself, it is also the causal generator of other existents. A mere "perfect," (*tamām*) entity generated by the most perfect, is persistent due to itself, while an "imperfect," entity (*nāqis*) needs another for it to persist."<sup>50</sup>

(iv) Another distinction lies in the nature of the soul and the role of the body in human salvation. Inge states that "the

essence of Neoplatonic mysticism is the belief that the Soul, which lives here in self contradiction, must break in succession every form in which it tends to crystallize. This is where it differs from Catholicism...[which] promises peace as the immediate result of submission and obedience...but for the mystics...there is no rest from striving...[T]o stop short [of union] is to leave the quest unfinished."<sup>51</sup> Stace agrees on the distinctions between theism and mysticism on this point.<sup>52</sup> Like Zaehner, Plotinus too teaches "isolation," for example in the following: "Often I have woken up out of the body and have entered into myself, going from all other things" [IV.8.1-2].<sup>53</sup> In a person, the body is a mere icon or an image of his/her soul in its lowest state; embodiment is the logical end of descent from which ascent takes place. Consequently embodiment is a positive, natural stage as a necessary phase for later purification, a theme elaborated upon by later Neoplatonists of all traditions. For example, the Ismā'īlī thinker, Nāṣir Khosrow (b1004-1072-78) notes that the particular soul (*nafs-I juz'ī*) needs to be emanated from the universal soul (*nafas-I kulī*) and ultimately return to it.<sup>54</sup> In Neoplatonic mysticism, descent is a necessity for the mystical union. By contrast, in theistic mysticism, isolation of the self from the body is for the sake of intimacy with God not due to the remoteness of matter from the One. In context of the Christian Eucharist, the believer partakes of a matter which serves as an icon of the body of Christ. A related topic is the issue of incarnation as depicted in C. Osborn's recent comparison between Platonic and Christian love; she states, "Unlike the Neoplatonic soul, cast into bodily life as a punishment or imprisonment against its will, Christ's incarnation is chosen for a loving purpose, to redeem the lost sheep."<sup>55</sup> I reject Osborne's interpretation of Plotinus; the embodiment for Plotinus is a free act (but also determined) being a "standard" phase in the drama of salvation; the savior figure in Neoplatonism is its intellectual awareness of its affinity with the One.

(v) Not only is emanation by necessity, so is ascent free from God's love, affections, etc. By contrast, ascent is due to a person's effort (they are both free and dependent). Most of the philosophers in the Islamic tradition adopted Neoplatonic

emanationism instead of creation theory. For example, J.J. Houben shows that Avicenna's philosophy is incompatible with Islamic orthodoxy; Avicenna's mystical union with the Necessary Existent is not a "gift" from God; instead, it is due to the natural knowledge of the Necessary Existent.<sup>56</sup> Through natural knowledge, and not religious calling, we comprehend the cosmos and its Necessary Existent who is the beholder of the cosmos. Thus every entity in this world is a necessity, the first being a categorical necessity, while others are conditional necessities. Moreover, the absolute of the Neoplatonic tradition resides in its abstract-simple state, while, as S.T. Katz states, for the monotheistic tradition of Judaism, it lies in the personal God.<sup>57</sup> A similar insight is presented by W.J. Wainwright, who points out that although Plotinus uses the language of love between souls and the One; here love is asymmetrical; the One of Plotinus is loved like the God of the theists but unlike the God of the theists, the One does not love in return.<sup>58</sup>

(vi) The next topic relates to differences between Neoplatonism and theism on the theme of the unity of being (*al-wahdat al-wujūd*). The major role of this doctrine is well brought out by Inge who asserts, "The Unity of all existence is a fundamental doctrine of all mysticism."<sup>59</sup> It is true that in Neoplatonism there are theoretically sharp distinctions between the One, the intelligence, the soul and matter as a reflection of the soul. But each entity in this descent, emanated from its predecessor, contains a dimension of its predecessor and returns to its predecessor. On this principle of "reversion," Proclus states: "All that proceeds from any principle reverts in respect of its being upon that from which it proceeds" [*Elements*, prop. 31, p. 35]; and "Every effect remains in its cause, proceeds from it, and reverts upon it" [*Elements*, pro. 35, p. 39].<sup>60</sup> The monistic vision of the immanence of the ultimate being is both ontological and phenomenological, as shown by W. Earle, who points to "the experience of the identity of myself and the Absolute."<sup>61</sup> The thesis of "identity among persons and the ultimate being" cannot be construed in a monotheistic system in which persons are particular entities while God is transcendent. By contrast, in Neoplatonism, as Plotinus stated, the moral ethos of a person is judged by the degree of the

"no-otherness" between persons and ultimate being [*Enneads*, V. 1., 1]. Persons by the mediacy of abstractions are invited to ascend towards the One. In contemporary language "otherness," means "alienation"; and alienation according to many existentialists, psychoanalysts, and Marxists is the most significant problem of modern times.<sup>62</sup> Such a problem cannot be formulated in a truly monistic system, in which a person as a part of nature cannot be alienated from nature. Plotinus preaches that the soul moves towards a state of "no-otherness" with the One. In societies which officially adopted monotheism, nature mystics who interpreted this union as an identity have often been branded as heretics. In Islam, Manṣūr Hallāj, the celebrated mystic who expressed the monistic doctrine of "*ana al-Haqq*," was burned to death. Professor Zaehner's reaction to such a monistic idea is less dramatic. I disagree with Zaehner's premises, but I think that Zaehner's system is consistent when he, as a theistic believer, disapproves of extravertive monism.

## V. Neoplatonic and Three Other Senses of Monistic Mysticism

Having clarified the first level terminology of "theistic," and "non-theistic" mysticism, this essay will now advance a refinement of "monism," in four different senses.

### 1. Stoeber's typology of "theo-monism"

We have already indicated that this type, in its monotheistic context, is ontologically dualistic but phenomenologically monistic. This intimacy is non-symmetrical, since souls-persons are not Deified, but by relating to God lose their alienation. In contrast, Plotinus states that "every soul... made all living things itself, breathing life into them, those that the earth feeds and those that are nourished by the sea, and the divine stars in the sky. It made the sun itself, and this great heaven, and adorned it" [V. 1. 2. 1-4].

### 2. Neoplatonic Eidetic monistic mysticism

Let us begin by clarifying the family of themes which depicts this kind of mysticism:

(i) *Abstractness*: Ontologically the Good and the Real are atemporal and abstract entities. Objects of sense perception or feeling of interpersonal relationship are concrete. Thus, both ontically and normatively are in a lower status than the abstract entities.

(ii) *Interconnected Realistic Monism*: The system is monistic in the Leibnizian sense that a total description of any entity includes the One and the other entities in the world. Reality is not depicted in phenomenological terms, but in a system of non-personal objective entities which persist outside the consciousness.

(iii) *Cognitive intelligibility*: Abstract entities are either cognitively intelligible like Platonic forms, or refer to the One which transcends limits of discrete reason and can be encountered only through an allegorical or symbolic theology.

(iv) *Rationalism*: Faith, sentiment, piety, sense perception and the like have a state inferior to reason.

(v) *Iconic function of the concrete*. Concrete entities, like a particular flower or personal, temporally indexed experiences such as loving a mate or a relative are, at best, mere icons of abstract entities. They are preliminary steps to ascend towards abstract entity. Philosophy is permitted to refer to the One by making use of icons such as light, mirror and water instead of clear, analytically descriptive language.

(vi) *Ethics of the simplification process and the self realization ethics*: The drama of cosmic salvation begins with a descent and culminates with a return. There are two similar models: first, the Neoplatonic emanation-return, and a second, which is embedded in an eschatology of the Divided line, symbolized by the allegory of the cave, as well as love in the Symposium. Once again, the encounter with the One is not anti-rational but supra-rational or meta-rational.

Christian theology also has a fall, a sacrifice, and a way of return to the path of God. But in a Neoplatonic system persons do

not communicate with the Form of the Good, do not perform prayer or sacrifice; there is no set of religious rituals; what is demanded is not a blind faith, but a rational state of awareness of the superiority of the eternal over the ephemeral. For example, Plotinus states that the soul is "amphibious," and "in spite of everything, it always possesses something transcendent in some way" [IV. 8., 4: 29-31]. As D. O'Brien notes, with respect to natural objects, the soul has a dual function. First, the soul generates matter; then, the soul provides matter with forms which completes matter into a body.<sup>65</sup>

The salient feature of Neoplatonic mysticism, according to John N. Findlay, is depicted in the "the Eidetic Turn." In such a system the emphasis is no longer on the "individual," but how forms such as "Manhood and Justice are 'thisified' or 'thatified,' or 'hereified' or 'thereified,' 'nowified' or 'thenified' in this or that case."<sup>66</sup> A key concept is that generic and specific features become the true and primary cases of identity, an identity unaffected by multiple locations in space, or changing locations in time.<sup>66</sup> Here, ontic primacy is placed not on particulars—this thing here—but on "*eidos*, idea-form-universal"; moreover, "unity [is treated as] a peculiar instance of itself, having no other attribute but being purely and resolutely single."<sup>66</sup> Thus individual spatio-temporal objects receive their significance only as far as they instantiate or exemplify a Form. In Neoplatonic monism, only the One is the source of its own persistence as well as being the source of generation of all other entities. Individual souls achieve their appropriate state, not by persisting as they are but in their ascent when there is no otherness between them and the One. The essence of a monistic ontology is not sacrificed in Neoplatonism, as the souls are not ultimately distinct from the One; the One is the origin (*arche*, *aşl*) of all entities. The soul, Plotinus tells us, "possess a power directed to the world here below" [IV. 8., 4: 3-4]; but he prescribes that souls should not "forget their father, God, and be ignorant of him...[T]hey are parts which come from a higher world and altogether belong to it" [V.I., 1-4]. The process of simplification, the mark of ascent, is in fact, a process of de-individualization. Simplification as clarified by Findlay depicts an *unbroken continuity* of the eidetic system.<sup>67</sup> All layers of the emanations from the One-Unity aim to return to the One. Plotinus often hints that this descent is necessary, "When it is eternally necessary by the law of nature that it [the soul] should do and

experience these things, and, descending from that which is above it, it meets the need of something else in its encounter with it; if any one said that a god sent it down he would not be out of accord with the truth or with himself" [IV.8., 5:13-18]. In a subsequent passage, he notes: "So then the soul, though it is divine and comes from above, enters into the body and, though it is a god of the lowest rank, comes to this world by a spontaneous inclination, its power and the setting order in of what comes after it being the cause of its descent" [IV.8., 5:25-28]. In Neoplatonism there is no contradiction here, as Plotinus states that "necessity contains the free will..." [IV.8.5: 4-7]. I agree with the general consensus that alienation is the antithesis of mysticism. How, then, is alienation overcome by the Neoplatonists? The answer lies in a state where there is "no-otherness," between the alienated soul and what is now united with the One. This vision is definitely anti-monotheistic for many reasons. As Findlay states, "the Trinitarian structure...is not acceptable from the Platonic point of view... [T]here is no place in Platonism for Incarnation theology."<sup>68</sup> But the Neoplatonic symmetry could be envisioned from the perspective of the One as a process of emanation and from the perspective of matter as a process for potential ascent. In this sense there is a twofold interpretation of the Universe as a continuum which Plotinus inherited from Plato's allegory of the cave. At each phase an entity is causally linked to a continuum. We have a connected universe. A mystical union depicts our best possible encounter with a total perspective of such a connected vision of the universe. Porphyry reports that Plotinus experienced "being oned" four times during his acquaintance with Porphyry.<sup>69</sup> As a matter of fact, as A.C. Lloyd delineates, there are three phases of epistemic-cognitive experiences of the soul: its judgment of sense precepts, its collections and divisions of intelligible objects, and finally its "seeing," and non-discursive encounter in the context of its union with the One.<sup>70</sup> In Muslim epistemology such a state belongs to the epistemic state of 'knowledge by immediate presence' (*ilm hudûrî*), an incorrigible state. It is very difficult for any one who is not a "friend of the forms," to have a comprehension of this vision. Any one who, like Professor Zaehner, prefers the smile of a child to a mathematical equation cannot empathize in the pleasure available to the friends of the forms. A friend of the forms appreciates the smile of the child as a mere icon of the form of the

Beautiful or the Good. A monotheist is not interested in the abstract One but in the Buberian encounter between the finite created I and the eternal Thou. The Neoplatonic One cannot think; Plotinus states "...if the First thinks, something will belong to it; and will then not be the First, but second, and not one" [V.6., 2,18-20]. Moreover, The One as the Good "must be simple and without need, it will not need think" [VI.6,4. 1-2]. Plotinus attacks Aristotle by saying that "Aristotle makes the first principle separate and intelligible, but when he says that it knows itself, he goes back again and does not make it the first principle" [V. 1, 9. 9-12]. Thus, the One of Plotinus, unlike the God of Monotheism, does not think and does not change. The ultimate aim of the soul-self is to ascend through the various levels and identify itself with the pure entity which is not beyond becoming, but beyond being itself. Eidetic mysticism teaches an agenda which takes persons beyond manifestations of God's grace such as the smiles of children and fragrant flowers. Consequently, there arises the misunderstanding of an acute thinker like the Christian Zaehner, who naively objects to Plato as follows: "Plato seems to have made the enormous, the grotesque mistake of separating Being from becoming, and identifying it with the mathematical abstraction of the Idea. He could never, poor fellow, have seen a bunch of flowers shining with their inner light and all but quivering under the pressure of the significance with which they were charged."<sup>71</sup> A friend of the forms would say that Zaehner resembles a child who plays with teddy bears and wonders why his parent who is a biologist attends to the species of bears and considers teddy bears to be a copy of a copy of a copy. When Plato "the poor fellow," inspects a flower he receives not only the form of the flower but an icon which can relate to him the Form of the good. Zaehner's flower disappears in the snow, while Plato's form of the flower is everlasting. Plotinus is not in any sense "against" the bodily dimension of persons; attendance to the needs of the body and to its disciplines are recommended (I.4.4). Being like a musical instrument, a person should give up the body graciously in the same manner that a musician may give the lyre which is no longer to be played (I.4.16.13-29). The body serves as an important element in the drama of salvation of the soul. Evil may be necessary if it is defined as falling short of the Good (III. 2.5.27) and like inferior animals, evil still lies inside of the natural plan. The world is depicted as a play with some characters who are not heroes; What

happens to this play if all inferior characters are eliminated (III. 2. 11)?

### 3. Extrovertive Monistic Nature Mysticism

For a transition between the Eidetic and nature mysticism let us make a comparison. In agreement with his Eidetic sense of mysticism, Plotinus notes that, "the greatest beauty in the world of sense, therefore is a manifestation of the noblest among the intelligibles, of their powers and goodness..." [IV.8., 6:24-27]. In contrast to this vision, an extroverted "nature" mystic holds that the beauty of this world is due to itself, and the smile of a child or the smell of a rose does not need to represent an icon of a hidden meaning for it is beautiful in itself. There are obviously experiences which may be immediately pleasurable like drugs, alcohol, and unsafe sex, which may lead to insanity, destruction of one's liver and brain, and death through AIDS; but all pleasures need not have such drastic consequences; some stand on their own merit or virtue (*arete*, *kamāl*).

The most common form of non-religious mysticism is found in the human struggle against alienation; a person feels at home in physical nature in the mode of ecophilia, without a need to presume existence of any supra-natural, divine entity—just his/her will to power, to life. Here we need to distinguish between different senses of living experiences as well as different senses of "nature." Philosophers of mysticism often distinguish between the introvertive and the extrovertive types of experiences. Basically, the former is concerned with the intentional depiction of the world as received by the experience of the subject, while the latter refers to thoughts and sense experience without much reference to the subject. Religiously oriented scholars do not deny "extrovertive experiences," but normally assign to them a lower (moral/normative) status. For example, M. Stoeber notes, "In theism, extrovertive mysticism is considered a lower level of aspects of the Divine, not a personal assimilation and integration of this Divine."<sup>72</sup> A paradigmatic case of an extrovert nature thinker is the Roman poet Lucretius, the author of *De Rerum Natura*.<sup>73</sup> Bailey notes that "Lucretius is an impersonal poet; his subject is all in all, and there is very little which directly reveals his own sentiments or experience."<sup>74</sup> For him all nature consists of matter and void—as proved by the sense.<sup>75</sup> A person is merely part of the temporal

complex of the flux of ever becoming which is called nature. He holds that "when I am, death is not; when death is, I am not." In the same way that one should not feel sorry for a movement or a melody in a symphony when it passes away, one should not feel sorry because of aging or the fate of death, and dying as our lives lead to the lives of offspring. For the monist of this type, psychological despair and the feeling of alienation and the like are due to ignorance and confusion about the nature of the world. The savior is a philosophy of humanistic naturalism which allows persons to optimize the aesthetic pleasure of their experiences, including, according to the Epicureans, relationships such as friendship.

Reaffirming Stace's position, Stoeber, notes that "Nature mysticism has been called extrovertive mysticism...[dealing with an] outward experience involving sensory reality."<sup>76</sup> The latter includes what Spinoza names *Natura Naturata*; as H.H. Joachim states, this is "the eternal system of God's modes, which is the consequence of the free causality of God [as *Natura Naturans*]."<sup>77</sup> Zaehner correctly identifies Spinoza as a "nature mystic," and Stace takes him to be a pantheist with a mystical consciousness.<sup>78</sup> For Spinoza, substance, nature and God are one and the same; they designate the only one total reality of the world. Spinoza's type of mysticism prohibits any dualism between persons and the world. As M. Wartofsky points out, for Spinoza, "...a science of human nature is continuous with the science of nature; that human action and passion are subject to universal laws, and therefore as subject to rational understanding, as the motion of bodies...in geometry."<sup>79</sup> Thus Spinoza provides us with an example of nature monistic mysticism whereas G. Deleuze notes that expresses the essence of God-nature as "...[to] be oneself an idea through which the essence of God [-Nature] explicates itself, to have affections that are explained by our own essence and express God's [or Nature's] essence."<sup>80</sup> An analogical account of this system is expressed by a common theme in nature-sufic poetry that persons and other modes of the world flow as rivers from the ocean of the One and come back to it; thus we depict a mode of nature as a melody in a symphony or a ray of light from the sun. The One is the ground of our being and the final cause of our return. Mystical virtues include receptive resignation (*ridā*) and authentic openness to receive (*kash*) our ultimate true self. We should note that this notion of

nature as a totality of all is consistent with the peripatetic view of nature being the source of its own notion and more extensive than the mere physical aspect of nature.<sup>11</sup>

This type of monism is distinct from the Neoplatonic in the following thematic sense. "Nature" for the nature monist includes what is received in physical experiences as well as what is received in psychological, aesthetic ones. It is nobler to think globally like the archangel of Leibniz than in a limited monadic perspective; or, along with Spinoza and Lucretius to universalize one's perspective from the concrete. All of nature is equally good and moral. In contrast, as J.N. Deck notes, for Plotinus "Nature is the lower part of the world soul."<sup>12</sup> A paradigmatic case of "nature mysticism" lies in the so-called "individuation process" of Jungian psychology, where salvation comes from integration in nature.<sup>13</sup> As Inge enumerates, in this context, the major three steps are "purgative," "illuminative" and "unitive" life.<sup>14</sup> Inge remarks that the paradigm of the purgative stage is exemplified in the manuals written for monks. The unitive we note, belongs to the extrovertive nature mystics.

#### 4. Existential naturalism as a type of monistic mysticism

In this vision of mysticism, ontic priority is given to the temporal experiential field of the subject; the subject here is not the isolated ego-soul but analogous to the Heideggerian *Dasein* (being-in-the-world). The ontic status of the God of the theists or the abstract forms/the One of Eidetic mysticism is turned upside down. Against Plato's claim that time is the moving image of reality, being-present-in the world is the only reality through which all archetypes are actualized. For example, the form of beauty or love is actualized in this very momentary embrace.

Existential naturalism and American pragmatism have many themes in common. For example, in ethics, immediacy of human happiness and choice take priority over the Kantian agenda for primacy of duty and social justice. In this tenor, C.I. Lewis distinguishes between two subject matters of ethics: the *summum bonum* and justice. Lewis remarks on Kant's position as follows: "virtue is the supreme good, but the highest and complete good requires also satisfaction of the human capacity for happiness, which is distinct from the moral and even on his [Kant's] account opposed to it."<sup>15</sup> The crucial point here is not emphasis on social

responsibility and cosmic justice but on the primacy of human happiness in ethics. For both the existential naturalists and modern pragmatists values is not distinct from and posterior to fact; instead, values are essential constituents of facts. C.I. Lewis explains, "Valuations are a form of empirical knowledge, not fundamentally different in what determines their truth or falsity, and what determines their validity or justification, from other kinds of empirical knowledge."<sup>16</sup> Consider, biological urges such as the consumption of food, love, or bodily reactions to adjust temperature. In these cases our valuations are dimensions of our actions. It is not true that we think first about the "objective facts," then we evaluate the facts and then act. Satisfactory explanations of actions must include the pragmatic dimension of valuations. Actions are not existents separate from other aspects of reality. Actions are dimensions of existents. This feature of existential mysticism is expressed by L. Wittgenstein as follows:

*Doing* itself seems not to have any volume of experience. It seems like an extensionless point, the point of a needle. This point seems to be the real agent. And the phenomenological happenings only to be consequences of this acting. 'I do...' seems to have a definite sense, separate from all experience.<sup>17</sup>

In sum, for existential naturalists' immediate experience, valuing and doing are not different types of existents but dimensions of the experience not posterior to the One of Plotinus or Platonic forms.

Family members of this trend have always been present in philosophy, beginning with Heraclitus and the remarks in Plato's *Theaetetus* on Protagoras' theme "Man is the measure of all things." A number of important philosophers attack the Eidetic terms by placing the concrete here above the idea (*eidos*). The most celebrated case is Aristotle's insistence that all accidents are actualized via the primary substance. The next candidate could be Kant's view of imagination; for him, concretion of the categories of understanding happens through imagination, which is the temporal indicator of experience. As we shall elaborate later, in medieval Islamic poetry, existential mysticism is explicitly stated in the context of the doctrine of the unity of being. The historical roots of this doctrine may be in Eastern Iran, in Zoroastrianism (c. 1200). H. Corbin and others claim Islamic mysticism in its Iranian

context was influenced by Hermetic illuminationism of Zoroastrianism.<sup>28</sup> According to this religion, Ahura Mazda the Wise Monotheistic God personified actuality and battled the myth of evil. Ahriman was the icon of Not-being. To strengthen himself against not-being, Ahura Mazda created human beings and commanded: let there be life—the will to power. By propagating life, learning, and cultivating the land, human beings, who are vicegerent of God, attempt to bring evil—not being—to its knees. Experience is not a passive encounter with facts. By contrast, persons with will a to power and to life create realities. F. Nietzsche's intuition that Zoroastrianism supports an aspect of his "will to power" philosophy was correct. But the affinity between the soul-self and God is noticed in many philosophies. Plotinus asserts that "if anyone is going to admit that it knows God, he will be compelled to agree that it also knows itself" [V.3.7]; here he means that if God is known, then God's effects are also known; because self is an effect of God, then God is also known. In existential mysticism, if one knows one's self, then one is aware of the phenomenological outcomes of the self, which includes God. There is a similarity here also with Bergson's concept of *elan vital*, perceived from the existing energy. Here the monistic theist's system is turned on its head.

A paradigmatic case of this theory is found in the medieval poetry of Sheik Mahmud Shabistari, who rivals Jallal ad-Din Rumi in the depth of his Sufi mysticism. Shabistari states in a poem:

In unity there can never be a multiplicity. Two (distinct) points cannot be the one single center of unity. I do not know if the One (literally, the beauty mark of the beautiful face *khāl-i ruy-a zibā*) is a mere reflection of the heart (self). Or, [if] this heart is the reflection of the One. [I ask] Is the heart to be found due to the reflection of the One; or, the Does the One appears due the reflection of the heart? Is the heart based on the One or the One on the heart. This complicated secret is hidden from me. How can the hearts be the reflection of the One, as the heart is in a state of flux perpetually?<sup>29</sup>

This poem is not an accidental passage, as the theme in question is supported by a large number of other passages. For example, the Sheikh defends Hallaj's famous identification of the *cogito* with the absolute by saying that "'I am the absolute' is the revelation of [true] secrets, the only speaker of 'I am the absolute' must be absolute itself."<sup>30</sup> In another passage he asserts that "The universe

is found due to the light of the Absolute [literally, Him], how can the Absolute be found in the Universe."<sup>31</sup> In another passage the Sheikh finally answers the primordial question of "Who am I?" as follows: "since one can only refer to the Absolute existence [*hast-i muṭlaq*] in an iconic mode, the [wise] refer to it as I."<sup>32</sup> In Islamic mysticism, the depiction of an intimate relationship between the self and the Absolute is a common theme. As al-Ghazali points out "the self-soul" and God-world are transcendental conditions of experience.<sup>33</sup> But one finds parallel themes in the Western tradition. For example, Augustine states, "God and the Soul, that is what I desire to know." When asked, "Nothing more?" He answered "Nothing whatever."<sup>34</sup> Wittgenstein's account of the self in the world corroborates this phenomenological theme as he notes: "I am my world," and "The Philosophical self is not the human being, not the human body, or the human soul, with which psychology deals, but rather the metaphysical subject, the limit of the world—not part of it."<sup>35</sup> Even Plotinus (in contrast to the body) emphasizes soul's unqualified perspective in contrast to the body by asserting that, "...all soul is present every where, made like the father who begets it in its unity, and its universality" [V. 1, 2, 39-4 1]. In Jungian analytical psychology, salvation is constructed in a self-realization ethics of individuation, the last phase of which is integration of "God-nature," in the self. Accordingly Jung states, "The self...a God image, or at least cannot be distinguished from one. Of this the early Christian spirit was not ignorant, otherwise Clement of Alexandria could never have said that he who knows himself, knows God."<sup>36</sup>

Against the Neoplatonic Eidetic view the primacy of immediate experience has support in everyday life as well as in philosophical traditions. Suppose a plane that carries someone dear to you is two hours late. For you, the second hour feels much "longer," than the first, while for an impartial bystander, the "geometrical," time of the second hour is the same as the first. When your automobile develops trouble on a trip or it begins to snow heavily the distance to the destination "seems further." In sum, existential time, a time related to the feeling-space of a subject is an experiential dimension of a reality. In this tenor, Bergson refers to that dimension of "time [which] is at first identical with the continuity of our inner life...a melody to which we listen with our eyes closed...and comes close to coinciding with this time which is the very fluidity of our inner

life."<sup>97</sup> Several writers claim that such a phenomenological perspective embeds the language of religion. For example, William Earl notes:

Phenomenologically speaking, what could be more obvious than that the very language of religion and metaphysics, the sense of their terms, the meaning of such terms as eternity, God, Absolute, Reality, Identity, and the rest would be impossible for us, unless there were in each self resources out of which those terms could draw their sense.<sup>98</sup>

Earle goes on to claim that "Absolute reality has *no value at all*," it can only be used as an empty center which works as an allegorical principle of the cosmos.<sup>99</sup> Most scholars of Neoplatonism agree on the compatibility of this theme with Neoplatonism. As A.C. Lloyd tells us, "Certainly the (Neoplatonic) genus which contains its species only latently—still more the genus of all genera—cannot possibly be covered by a phenomenological description."<sup>100</sup> Similarly, R.H. Jones observes, it cannot claim identity with the One.<sup>101</sup>

A salient mark of existential mysticism in its Islamic version is the epistemology of revealment of the hidden truth (*al-Kashf al-Mahjūb*). This doctrine has a close affinity with the rise of Islamic phenomenological epistemology after Avicenna which emphasized knowledge by presence (*‘ilm-I hudhūrī*), and by revealment (*kashf*). In perception the subject is conscious and supposedly receives information about concreta, for example the distance between the earth and the sun. In conception and deduction analytical truths and valid structures are contemplated. In mysticism, the gnosis (*ma‘rifat*) sense of knowing is depicted in a process of transformations of the self through different phases of self-realization. The preliminary phases display alienation from the Divine; the middle phases display love of the mediator figure; finally a mystical union (*ittiṣāl*) occurs in which the alienated soul-self (*nafs*) is annihilated (*fanā*) and persons are preserved (*baqā*) by incarnation (*hullūl*) the divine dimension.

Finally is a list of at least one salient difference between existential mysticism and the other three types of monistic mysticism: its incarnation of the divine (vs. the absorption of the self into God in theistic-monism); it emphasizes concrete immediacy (vs. the abstract dimension of Neoplatonic Eidetic mysticism); and it emphasizes the phenomenology of incarnation of

the entire nature within the self (vs. a dissolving of 'the self in nature' type of monistic mysticism).

## VI. Conclusion

In the monotheistic tradition, Neoplatonism is the most significant source of all theistic as well as non-theistic types of mysticism. In spite of this influence, Neoplatonism itself is not a religious type of mysticism due to its Eidetic monism. Contrary to Zaehner's position, not all monistic systems are anti-religious or irreligious; as Stoeber points out, one could construe an interpretive monistic model which is theistic. Finally, not all non-religious mysticisms are Neoplatonic; we have described two types of genuine monistic mysticisms which are non-religious and not Neoplatonic. Hopefully this essay clarifies some of the key elements in the relationship between Neoplatonism, and mysticism.

## NOTES

1. For the sake of brevity and preciseness, our context is limited to monotheistic traditions and to its philosophical counterparts in Ancient Greece, Ancient Near East, Judaism, Christianity and Islam.
2. Otto, R., *Mysticism: East and West* (New York: Macmillan, 1960), pp. 33-72.
3. Unless specifically stated, all translations of the works of Plato are taken from *The Collected Dialogues of Plato, Including the Letters*, trs. E. Hamilton and H. Cairns (New York: Bollingen, 1966); the references to the Greek texts are from the Loeb bilingual editions of Plato's dialogues. Cf. D. E. Anderson, *The Mask of Dionysos: A Commentary on Plato's 'Symposium'* (Albany: State University of New York Press, 1993), p. 93.
4. Cornford, F.M., *Plato's Cosmology* (Indianapolis and New York: Bobbs-Merrill, 1937), pp. 33-34.
5. There is a difference in the Neoplatonic and Avicennian languages. For Avicenna, "being" applies to whatever is significant; thus for him the Necessary Existent is a "being" but not a substance. For Plotinus the One is "supra being," (mistranslated as 'beyond being'; in both systems the ultimate entity is the generator of all existents. Cf., P. Morewedge, "Philosophical Analysis and the Essence Existence Distinction,"

- Journal of American Oriental Philosophy* (1972):49-73.
6. Gilbert, R. A., *The Elements of Mysticism* (Longmead and Rockport: Element Books, 1991).
  7. See, Kingsland, W., *Rational Mysticism* (London: George Allen and Unwin, 1924); and Stace, W. T., *Mysticism and Philosophy* (London: Macmillan, 1960). pp. 31-38. Besides, facing Aristotle, as the sharp opponent of Platonism. Plotinus refined Platonic answers to Aristotelian criticisms. Moreover, he differed from Plato on several topics such as the ontic priority of the Good over the beautiful and the cognitive status of aesthetics. For these reasons he cannot be treated as a mere commentator on Plato.

## Neoplatonism and Contemporary Slavic Spirituality: Survival and Revival of the Fittest in the Soviet and Post-Soviet Eras

Roman T. Ciapalo

The waning moments of the twentieth century have been witness to a variety of social and political upheavals, not the least of which was the recent abrupt dissolution of the Soviet Union. Many have noted the moral tenacity and spiritual hardiness of the people during that system's existence, as well as the startling revival of religiosity and spirituality there since the system's demise. However, it must be pointed out that this apparent revival is but a new stage of an ongoing process in the lives of the Slavic people. What has changed are the conditions, political and economic, that now permit a more open exhibition and practice of individual spirituality and religiosity. But, the nature of that spirituality remains the same. And its roots are, to a certain degree, Neoplatonic, the general exploration of which this paper will shortly attempt. But, first, a word about spirituality itself.

The term "spirituality," for the purposes of this paper, will be considered as denoting both a state of mind and a *modus vivendi*, characterized by a belief in the existence of an immaterial dimension of reality, comprising, at least, the existence of the human soul, God, and the afterlife. Now, it must be kept in mind that in the various Slavic languages, the word that is most often translated into the English word "spirituality" is a term which is rich in meaning and which is not fully captured by one particular English word. For example, the Ukrainian word for what we might call spirituality, namely, *dukhovnist'*, refers to that state of mind which issues into a way of living characterized by a profound reverence for one's ultimate origin, a deep sense of humility about one's status as creature, an abiding trust in the efficacy of Divine

Providence, and a respect for one's fellow creatures, both human and non-human.

Before turning explicitly to the discussion of what elements of Neoplatonism can be identified as instrumental in defining this pattern of Slavic spiritual survival and revival, allow me to make two further observations. First, Neoplatonism's influence on Europe and the Near East was often indirect. It was not always recognized that the Middle Ages and Renaissance saw Plato through a Middle and Neo-Platonic prism. But, the fact is, as R.T. Wallis has pointed out, "that the dominant trend in Christian theology, in both its Platonic and Aristotelian forms, has always been Neoplatonic."<sup>1</sup> Secondly, although indirect and sometimes vague, the Neoplatonic influences on the contemporary Slavic Christian world, particularly in Ukraine and Russia, are as unmistakable as they are profound.

Accordingly, the task of this paper shall be to examine briefly those elements of Neoplatonism which were, and continue to be, operative in the lives of the survivors of Soviet totalitarianism. I shall focus on those dimensions of Neoplatonism which were most influential in sustaining the spiritual life of the oppressed and which now are contributing factors to their spiritual revival. Furthermore, although I shall focus my remarks on the Ukrainian experience, most of what I have to say is generally transferable to other Slavic peoples and, therefore, to other parts of the former Soviet Union. Finally, this is not intended primarily as a scholarly paper, relying on the customary degree of bibliographical research and extensive documentation. Rather, it aims at making a few broad suggestions and at provoking interest in an area that has heretofore not been explored fully. Accordingly, what I propose to offer are a few strokes from a rather broad philosophical brush in an attempt to connect several Neoplatonic themes with the rather unique experiences of those whose lives were affected by a particularly harsh and long-lasting form of totalitarianism.

The Neoplatonic themes that appear to be particularly relevant to an analysis of the spiritual survival and revival of Ukrainians and others during the past few decades are: unity, mysticism, asceticism, and Divine Providence. Let me begin with the concept of unity. We are all aware that for Plotinus, to be real is to be one. How does this most fundamental of Neoplatonic insights appear in the twentieth century world of Slavic Christianity?

Let us, first, consider one of its more controversial manifestations. In the East there has been, and continues to be, considerable concern over the identification of the term "Roman" with the term "Catholic" and, worse yet, of "Catholic" with "Latin." The tendency to speak only about the Catholic Church of the Latin Rite, but not about the total church of Christ, is considered a perilous one. In this regard, the East can serve as an important visible sign of unity for the entire Church, and one that has much to contribute to the Western Church. An obvious example of the destructiveness of the shift from unity to multiplicity in this regard is the compressing and narrowing of the whole of the Christian life to the Latin mode. The price for this mistake was the tragedy of the Reformation, with its continuing unhappy consequences.

Accordingly, it is the Eastern Church's recognition of the significance of unity that leads it to protest the multiplicative and divisive tendencies of the West on the one hand and of political totalitarianism on the other. Although the motives are vastly different and the consequences of the actions profoundly dissimilar in their gravity, it remains true that any shift away from religious and spiritual unity is a destructive one. The attempt by the Soviet Union to "divide and conquer" its subjects, not only on political, but on religious and spiritual grounds, betrayed the depth of its misunderstanding of the Eastern, and in this case, Slavic, tendency toward genuine unity and oneness. Paradoxically, in the name of a materialistic and, hence, merely nominal sort of unity, the dictatorship of the proletariat, the totalitarian regime equivocated on the principle of unification to promote precisely the opposite effect: disruption, division, and destruction of genuine unities within society, namely, the family, the church, and the state.

Please note, additionally, that the attempt to return to genuine Catholic, if not Christian, unity, and perhaps to an even broader sort of ecumenism, was initiated by a Slavic pope, himself no stranger to the dangers of the Soviet system and a person who has been credited by some, arguably with good reason, as one of the chief causes of the acceleration of the collapse of the Soviet Union. Whether consciously and deliberately or not, by his actions this pope continues to bear witness to the Neoplatonic dictum that the path is identical with the destination, namely, unification.

There is a further, related point to be made here. The fundamental weakness of the Soviet system was twofold. Not only

was it based on a profound misunderstanding of the nature of the human person, as essentially an economic and material agent, but also on the adoption of an overall conceptual system that was all too rigid, an extreme just as dangerous and unnatural as its more chaotic opposite, namely, too little rationality.

Materialistic totalitarianism, then, is based on a misunderstanding of the concept of unity. Genuine unity, as Neoplatonism reminds us, does not consist of mere aggregation of elements, as is the case with any political system based on materialism. Rather, authentic unity is based on individual spiritual integration and on an awareness of the individual's entitative relationship to the whole and ultimately to his or her source. Slavic Christianity, and particularly Catholicism, bases its conception of religious and political unity on the relationship of the human spirit to God and to other human beings.

With respect to the latter relationship, it is *patriotism* (i.e., the love of what one holds in common with others) which is to be preferred to *nationalism* (i.e., the hateful and destructive emphasis on the merely apparent and non-essential differences within humanity). Plotinus' insistence on unity as central to ■ genuine metaphysics and as the heart of moral behavior, gives direction to a post-Soviet world which finds itself at the political, religious, and economic crossroads, pitting nationalism against patriotism, sectarianism against ecumenism and authentic catholicity and the command system against the free market.

Plotinus has more to say to materialists, dialectical or otherwise, as well as to atheists. Please note, to cite but one example, his devastating exposition of the poverty of anthropomorphic conceptions of God in *Enneads* VI, 4–5. This critique is, in its own way, a powerful foreshadowing of the rationale for the deliberately two-dimensional iconography of the Eastern Church, where the emphasis is away from the depiction in precise anthropomorphic terms of the qualities of God, and in representational terms of the Blessed Virgin Mary and the Saints, and towards the portrayal, to the extent that this is possible, of the immaterial dimensions of the inhabitants of the divine realm.

The significant tension within Neoplatonism over its ambivalent attitude to the material world notwithstanding, it seems clear that Slavic Christianity's attitude to the material order has been ultimately positive. And the principal reason for this appears to be

traceable to Byzantine Neoplatonism's view of creation as "theophany," or manifestation of the divine, a further refinement of Plato's view that the material world is an image of a higher order, the intelligible world, from which the former derives its positive value.<sup>2</sup> And it appears that Eastern iconography is but one particular application of this general theory.

This move away from highly representational, and towards more abstract, religious art forms by the East signals a deliberate focus on the mystical aspects of the human being's relationship to the divine. And even though the Neoplatonic tradition appears to assign too little significance to the body and to the material world, Pierre Hadot has argued convincingly that we ought to understand that positively, as constituting an emphasis on the purification of the spiritual life, and not negatively, as the thorough abolition of what is surely an important and indeed inescapable part of human existence.

In this way, theology and mysticism are closely related in the tradition of the Eastern Church in general, and in the Slavic Christian Church in particular. And the ultimate aims of such a theology are not theoretical, but practical; they lead to that which is above knowledge. And the mystical, as we learn from Neoplatonism, is precisely that realm of the real which is above and beyond the scope of reason. This is the realm of the supra-rational. Now, the Eastern mystical tradition has long been under strong Plotinian influence, traceable as far back as the thought of the fourth-century Cappadocian Fathers, Gregory Nazianzen, Basil of Caesarea, and, especially, Gregory of Nyssa.

As R. T. Wallis has so cogently argued, Neoplatonism "offers an antidote to the view, widespread among modern Anglo-Saxon philosophers, that philosophy must accord with the dictates of 'common sense.' And here Neoplatonism's empirical basis assumes special importance; for it shows that the paradoxicality of its conclusions cannot be avoided simply by rejecting its metaphysics as nonsensical, since paradoxicality is inherent in the nature of conscious experience itself, whatever conclusions may be built upon it."<sup>3</sup> This, of course, is particularly true when we turn to the deeper, or mystical, levels of human experience. And it is certainly applicable to the nature of the experiences of the peoples oppressed and persecuted by the Soviet system, for their fundamental consolation was itself rooted in paradox. As difficult to understand,

and as seemingly absurd, as their predicament appeared to be, its ultimate resolution was available, but not in this earthly life. In fact, no merely rational explanation could be proposed that would satisfactorily account for the depth and breadth of their experience of suffering. What remained was the religious, the super-natural, the mystical, namely, supra-rational, approach and a way of life consequent upon it.

If we are to explore fully the subject of Slavic spirituality, or mysticism as social action, the important consideration is, again, Neoplatonic. For the Slavic Christian, it is a distortion of the truth to suggest that mysticism is necessarily and by its very nature a form of personal escapism and selfishness, a way to avoid one's duties to one's fellow human beings. We learn from Plotinus' own way of life, as well as from his writings, that this is an abuse and misrepresentation of mysticism. The inherent tendency of mysticism is towards the moral life, the common good, and altruistic acts. Although departures from this ideal may be found in human history, witness the occasional instances of enjoyment of ecstatic experiences for their own sake, what St. John of the Cross called "spiritual gluttony," they represent failures of human nature and not defects of mysticism itself. What is mystical in the Slavic experience of the past few decades is multi-faceted. Whether or not the mystical experience, or better yet, the mystical dimension of human experience, is religious or not, W.T. Stace argues that the mystical is that which is "timeless or eternal which is felt to be also supremely noble, transcending altogether that transient world of flux, vanity, frustration, and sorrow."<sup>4</sup>

Although it would be quite difficult to argue that all religion is essentially mystical, one could make the case that *some* religions are. One might include in this short list Buddhism and higher forms of Hinduism, for example, as well as Eastern Christianity. Although one could not plausibly argue that Jesus was a mystic, the case can be made that mysticism came to later Christianity as a result of influences that were essentially Greek, and, in particular, Neoplatonic. What appears to be common to both Neoplatonism and Eastern Christianity, particularly Slavic Catholicism, then, is their mutual appreciation for the mystical dimensions of human experience. Both look beyond worldly concerns and primarily towards the eternal and infinite, while experiencing feelings befitting the holy and the sacred.

Now, it is precisely these elements of Neoplatonism, namely, unity and mysticism, which provided moral and spiritual support to those struggling to survive the ruthless and cruel rigors of the Soviet system and fueled the particular kind of asceticism and trust in Divine Providence so necessary in such circumstances. The Neoplatonic dimensions of this asceticism manifested themselves in terms of material self-denial for the sake of spiritual and moral nourishment and a willingness to suffer materially for the sake of one's religious beliefs. The dignity and grace with which Plotinus himself bore his physical suffering, as well as the reasons for his endurance, represents a suitably appropriate microcosm of the predicament of those held captive by the Soviet Union.

Like Plotinus, who was forced by the advanced stages of his illness to live in virtual solitude, so too the Slavic peoples were virtually abandoned and forgotten by the rest of the world. Yet, like Plotinus, they soldiered on, confident in their beliefs in the ultimate triumph of the Good and in the inevitable workings of Divine Providence. And now that these people are free, these same qualities can serve as the instruments in the formation of their new life of self-determination.

And like the tumultuous and half-civilized world in which Plotinus himself lived, the Slavic world under Communism was an equally difficult one in which to maintain one's fundamental dignity. But, again, like Plotinus, the Slavic world succeeded in rising above its vicissitudes. As Apollo so aptly described it, Plotinus' life was a struggle "to escape from the bitter wave of this blood-drinking life, from its sickening whirlpools, in the midst of its billows and sudden surges," and "often the Blessed Ones showed you the goal ever near."<sup>5</sup>

And it would not be too difficult or unnatural to see the Neoplatonic virtue of humility as an appropriate corollary to the sort of asceticism mentioned earlier. This kind of humility is exemplified by the realization of the impossibility of penetrating, by any rational or linguistic means, the ultimate nature of the divine. It is this paradoxical nature of human reason, simultaneously a great gift to human nature and yet one which is limited in power and scope, that the Slavic tradition, informed by Eastern Christianity, appreciates all too well.

Accordingly, the survival of those whom the Soviet system sought to dominate was facilitated by such character traits as

asceticism and humility, and it is these same traits which continue to be necessary if the revival of the post-Soviet populations is to have any hope of succeeding. It is in this sense that conditions there, as is often said, are going to get worse before they get better. In the long run, they will become better, but only if the survivors continue to heed the Neoplatonic prescriptions of the humble and ascetic life, particularly as they apply to spiritual matters.

Let me conclude with an examination of Divine Providence. It is here that the parallels to Neoplatonism, particularly to Proclus, appear once again. For Proclus, Providence involves the bestowal of good, and goodness is the distinctive characteristic of God. And it is God who grasps temporal events in a single timeless vision and knows contingent events without, however, being affected by their contingency. Similarly, the Slavic Christian sought consolation and found confidence in God's ultimate goodness and in God's appreciation of temporal events, including those involving suffering and injustice, in a way that mere mortals could not, namely, as part of a broader and ultimately good cosmic plan.

In the final analysis, it is the Neoplatonic attempt to articulate and cope with the paradox of reason's place in the spiritual life that may be found paralleled in the survival strategies, and in the current revival, of the Slavic Christianity. Of course, R.T. Wallis points out, "this dilemma was posed with particular force by the Neoplatonists' historical situation; and whatever criticisms may be made on individual points their basic reaction was unquestionably a sound one, and a sign of the general sanity and Hellenic moderation of their approach."<sup>6</sup>

And their "successes and failures have therefore much to teach us in our own spiritual search; for it is on our own success or failure in attaining a due balance that the future of our civilization depends."<sup>7</sup> The lesson we learn from ancient Neoplatonism and from Slavic Christianity's experiences in the twentieth century, then, is a similar one. Sooner or later, the spirit triumphs over matter, unity over multiplicity and divisiveness, the divine over the earthly, and the ineffable over the facile and the obvious. If one puts one's trust in Divine Providence, even the paradoxical is not impossible to appreciate.

# Neoplatonism in Contemporary Christian Spirituality<sup>a</sup>

Robert Cummings Neville

General spirituality, disciplined spiritual formation, and the professional art of spiritual direction are receiving renewed emphasis among religious people at the present time. Among the many reasons for this are developments in the understanding of religious symbolism. Quickly put, Paul Tillich's theory of symbols articulated ways in which certain symbols effect a communicative participation of the symbolizer in the realities symbolized such that the symbols need not be taken literally. By the theory of participation, Tillich showed how religious symbols are not mere representations. He thus provided an alternative to the Kantian approach to symbolism which requires an agnosticism (if not skepticism) about the religious object symbolized. By his theory of *broken* symbols, Tillich provided an alternative to Bultmann's dichotomy of demythologized symbols versus literal existential philosophic truth.<sup>1</sup> The Tillichian strategy regarding religious symbols has been given considerable technical sophistication by being read through Charles Peirce's philosophical theory of signs. The result is a new opportunity to interpret religious experience as realistic, capable of progression or improvement, and open to the points made in apophatic theology, which brings the discussion to the potential contributions of Neoplatonism.<sup>2</sup>

In this paper I shall begin by sketching certain features of a theory of religious symbolism as it pertains to spiritual growth, showing how not only the interpretation of such symbols but also their reference involves reshaping the soul in relation to the religious object to which reference is made. Then I shall contend that one of the most important issues in religious symbolism at the

---

<sup>a</sup> Another version of this paper appears in collection of papers by Professor Neville published by SUNY Press

present time is the symbolizing of eternity; most religious symbologies are preoccupied with time. Neoplatonism, of course, has a rich store of symbols for engaging eternity, and some of these shall be indicated. Finally, I shall argue that Neoplatonism specifically presents a symbolic path whereby the soul is able to transcend the merely human perspective, so important for most senses of symbolic interpretation, and come to occupy something like an eternal perspective in spiritually significant senses.

### I. Symbolism

A theory of religious symbolism needs to be at least as complicated as Peirce's analysis distinguishing meaning, interpretation, and reference.<sup>3</sup> Peirce pointed out that interpretation is triadic, with signs (symbols) being used to stand for referents in certain respects. An interpretation itself can be treated as a sign, and indeed can be interpreted by other signs as an object or referent. These three elements—the signs themselves, the interpretation of them, and the objects to which interpretation refers them—comprise some of the main topics of a theory of symbolism, and can be specified in the case of religious symbolism.<sup>4</sup>

The meanings of symbols are defined by the semiotic codes within which they lie. Among the many things shaped by semiotic codes are the rules that relate symbols to other signs or symbols to which they might refer, and that specify what interpretations are allowed of the symbols when referring to each of the referent signs. Furthermore, a given symbol might stand for a given referent in a number of different ways, depending on the respects in which it is taken by the interpretant signs to represent the referent. Some symbols also can refer to a variety of different objects, with appropriately different interpreting signs.

Semiotic codes are immensely complicated and subtle. To note that a symbol might have several different potential referents, and several different interpreting signs based on different respects of interpretation, is to indicate only the roughest and most schematic sense of semiotic structure. The important point to stress is that the analysis of meaning in this sense works entirely within the coded semiotic system. The symbols are signs within the semiotic system; so are the referents, and so are the interpreting signs. The study of

symbols' meanings in this sense is the analysis of possible legitimate interpretations of signs relative to referents within the semiotic system. It is a study of how things work within the system. It is not a study of actual interpretations, in which real objects are engaged, but only of possible interpretations as these are made possible by semiotic structures. The symbols are referred to other signs of objects, not to real objects themselves. Many thinkers have taken the fact, that the intra-code meanings of symbols involve reference to objects only as signified by other signs, to mean that there is no real reference outside symbol systems. But this is to confuse the potential structure of meaning in a semiotic system with actual interpretations in which the system itself is employed to engage realities for real interpreters. An act of interpretation is a real engagement, shaped for better or worse by the structure of the semiotic system at hand that enables discerning distinctions to be made.

In the case of religious symbols, and perhaps many other kinds of symbols, there are networks within a semiotic system of connected and interdefined symbols. For instance, among the symbols within Christianity for interpreting the religious significance of Jesus is the network of symbols centered around the dominant symbol of messiah. This network includes connotations of anointing victors and kings, the exercise of political kingship, protection of the poor and solitary, and the fact that the anointed king of Israel is the substitute for God who prior to the anointing had been regarded as the real king (1 Samuel 8). The "messiah network" is different from but related to the network of symbols for Jesus as teacher, involving the message of forgiveness and repentance, the kingdom of God, and ethical matters. Both of these networks are different from that concerning Jesus as the atoning Lamb of God, picking up on the history of the Passover and Exodus, and also the scapegoat sacrifice imagery of the Law.

The relations among the networks of religious symbols are rarely like logical theoretical implications. Rather, they are overlaid resonances, mutually reinforcing or correcting images. The networks I mentioned are sometimes listed in classical theologies such as Calvin's under the titles "King," "Prophet," and "Priest." Together they sometimes are taken to describe the "Work of Jesus Christ." Considered this way, they surely are coherent because one person can have three jobs; it was not uncommon for ancient kings

to be construed as having priestly and pedagogical roles. The relevant symbolic networks do not articulate three job descriptions, however, but far deeper symbolic meanings. They each express in their way something of what makes Jesus divine in the collected networks of Christian symbolism. They point beyond Jesus the man to something infinite. I shall discuss this at greater length in treating reference.

As they actually function in religious life, the various symbolic networks work together. That is, no functional Christology could be based on the messiah network alone, nor on any of the others alone. Theologians sometimes strive to reduce the symbolic networks to abstractions that can be harmonized and reconciled. All to the good. But the symbolic function of religious symbols, which is to engage religious people with the religious realities, involves the symbolic networks, not as abstracted, but as overlaid together, compacted, conjoined, juxtaposed, alternated, and sometimes plainly confused. The saints wash their clothes in the blood of the Lamb and have them come out white; this confounds the rationalists but makes perfect symbolic sense (Revelation 7). The intensity of symbolic engagement of religious realities often is achieved only by the fusion of networks, mixed together, alternated, or strung out as in a liturgical calendar.

Furthermore, the networks often serve as limitations or correctives of one another. For instance, the cannibalism network in the Christian eucharist, in which the communicants eat and drink the body and blood of Jesus, is directly limited by the network of the Righteous King who forbids murder and cannibalism: because Jesus is a righteous lord, the symbolic acts of ingesting him are only symbolic, with bread and wine substitutes being significant precisely as substitutes.

Scholars can study how a religious tradition shapes the semantic content of its semiotic code, tracing the possible connections among signs as symbols, referents, and interpretations. These connections can be called *extensional* because they exhibit the extensions of meanings within a sign-system. Actual interpretations use symbols as structured by semiotic systems to interpret reality. The symbol, with its semiotically coded extensional meanings, is used representatively to engage the reality to which it is referred in actual interpretation.

Actual interpretation always has a context. Scholars often think of religious symbols in theological contexts, where the interests of understanding push interpretive work to clarity and perhaps literalness. But religious symbols are most often used in the practical contexts of shaping a religious community's life. Religious symbols also are used in devotional life. In both practical communal contexts of interpretation, and devotional contexts, interpretation has a something of a doubled character. On the one hand, the interpretation draws out primary interpretants according to what is legitimated by the semiotic code, with certain qualifications. On the other hand, the interpretation draws secondary practical inferences from the primary interpretants for what should be done or changed in the context. The symbols of messiahship, for instance, in a Christian community make practical demands on how members of that community relate to political authority; the symbols of atonement have implications for how to handle guilt, and so on. In devotional contexts the interpretations not only convey the religious object into the soul through primary interpretants but secondarily move toward restructuring the soul practically so as to be able to entertain the religious object appropriately. Devotional interpretation aims practically to transform the soul so that the religious object can be carried over into it. This transformation of the soul bears upon the contribution I want to highlight shortly deriving from Neoplatonism. So much for interpretation. Now for reference.

Actual reference is to realities (1) as potentially engaged by the structure of the semiotic system and (2) as selected by the act of interpretation to be intentionally referred to by the symbols taken to represent them in certain respects. Interpretation is the engagement of realities by means of cognitive and other activities shaped by the symbol system. Actual interpretation is a function of intentionality, and hence the actual referents and actual interpretants can be called "intentional referents and interpretants" in contrast to "extensional referents and interpretants." Symbols shaped by their codes represent their intentional referents more or less well, and the process of interpretation, carried on over time by communities, involves correction. There is a crucial distinction between intra-code extensional reference and interpretation, and actual intentional reference and interpretation in which the code connects interpreters with realities. This distinction is abundantly

illustrated in the history of religions as traditional symbols systems are broken and amended, cut, filed, and polished, better to carry out the semiotic functions involved in real engagement. If all interpretation were intra-textual, it is difficult to understand from where the constant sense of frustration, misexpression, misdirection, and correction come.

Like interpretation, reference has a doubled referent. The primary referent is the religious object, and I believe that most religious objects are best understood as a contrast joining something finite and something infinite. This is a profoundly complex claim, expanding on Whitehead's theory of contrasts, that will not be explored here, except in illustrations below. The rough meaning of the claim is that something finite is referred to, by a culture's symbol system, in some capacity that is a grounding of the world or of some existentially important part of it. Without the finite thing in that grounding capacity, there would be nothing, or at least not the relevant religiously important phenomenon. The creation of the world is a finite/infinite contrast: without it, there would literally be nothing.<sup>5</sup> The things that ground meaning and value, such as Torah or the Quran, are finite/infinite contrasts. For Christians, Jesus is the redeemer, a finite incarnation of the infinite: without him there would be no redemption. Much more needs to be explained, of course, to indicate in what religious importance consists. But enough has been said for now to indicate the primary referent of religious symbols.

The secondary referent is to the symbolizers' own culture and state of soul. That a finite thing can function in a finite/infinite contrast is relative to the nature of the interpreter referring to it. It is as if to say, this finite thing bears the infinite, or demarks the border of the infinite, for interpreters of this type. So, for instance, creation of the world can be referred to with religious symbols for people in cultures that give importance to physical cosmology; it would not be a religious referent in some Buddhist cultures. Torah or the Quran could be grounds of meaning only in cultures that find meaning in law or patterned behavior. Jesus could be referred to as a redeemer, bearing the infinite in finite acts, only for those prepared to take their situation as in need of redemption. In the practical contexts of symbolization, the community needs to be sufficiently informed by the symbols of the tradition that it is partly constituted by them, and therefore can refer to the religious objects

in ways that make that reference secondarily appropriate for the community. And in devotional life, symbols often take on fantastic and exaggerated characters because they refer to primary referents that have highly idiosyncratic secondary reference to the state of soul of the worshiper. Jesus can be depicted as brown, black, yellow, red, or white, depending on the race of the community. God can be imaged as a father for those with a positive sensibility regarding parents, but perhaps not for those whose parents abused them. Liberating divinities can be shown as large fierce women girdled in skulls and waving swords, for some people but not for others. Even music can symbolize divine things only if its primary referent is coordinated with the emotionally and culturally shaped state of soul of the listener. In the history of a person's devotional life, different symbols take on meaning at different stages, and sometimes change in meaning, playing first childish roles and then adult roles, roles relative to spiritual fear and then again roles relative to spiritual love.

Given the project of an individual or a community to engage religious objects better, with greater depth and discernment, with more clarity and intensity, with greater accommodation to the nature of the object and less refraction by accommodation to the ordinary conditions of human life, better symbols are sought. But the worth of the symbols is not merely enhanced meaning within a semiotic system. The worth is in the quality of the engagement of people with the religious realities. Some people and some societies are religiously superficial, at least at times. There are always historical limitations to what can be symbolized engagingly at a time. Profundity is something that needs to be sought in every generation, by every religiously interested person.

## II. Eternity as a Problem

One of the chief projects for improved engagement with religious realities in our own time concerns eternity. Most cultures of the world now are preoccupied with time and with matters in their temporal dimensions. Cultures shaped by modernity are not only preoccupied but obsessed with time. Perhaps this is because the rate of change in modernity is so fast that the most important feature of anything is the fact that it is passing quickly, or so it

seems. But this is not a mere feature of popular responses to social technological conditions. The Western philosophic tradition itself has become time obsessed. Modernity itself did not begin that way. Descartes neatly balanced the spatial characters of corporeality with the temporal characters of thinking and united them both in an eternal divine creative act upon which goodness, reason, and even distinction or difference are dependent. But in Kant's philosophy, space is reduced to the marks it leaves on more basic temporal forms of intuition, and eternity ceases to be an element of reality to which cognitive reference can be made. Heidegger and Husserl continued Kant's grounding of things in time or temporal intuition, despite Husserl's attempt to carry on the more balanced Cartesian program. Dewey charted pragmatism's way into temporal action and transaction. Much analytic philosophy has focused on language in use, which has only a temporal form. And the most popular philosophical theology today is process philosophy.

The classic symbols of most religions, however, and fundamental theological texts, give great importance to eternity. In most religions, eternity is both the ground and the fulfillment of the temporal. Eternity has no single definition, of course. The most common rendering of eternity in Western philosophy is something like a single momentary glance that encompasses all times, past, present, and future, a pan-temporal presence-to-consciousness in memory and anticipation. Augustine is associated with that view. Many religions treat eternity as a kind of container for time, a matrix that has something like temporal qualities but not the finite limitations; for example, the Hwa Yen Buddhists speak of temporal worlds being nested in temporal worlds, the nesting itself being eternal; Origen speaks of aeons within aeons. A degenerate image or theory of eternity is that it is something by nature static and unchanging, such as a mathematical equation or a form; this is sometimes attributed to Plato but in our day it comes from modern confusions of space with eternity as the contrast term to time.<sup>6</sup> The drawback to Descartes' neat balancing of space and time is that they are not easily related in his view, and thence become contrast terms to one another, leaving out reference to eternity. Few philosophers have taken Descartes' theory of divine creation seriously.<sup>7</sup>

I believe that eternity is an extremely important topic for our time, for both philosophical and religious reasons. Philosophically,

eternity is important for the understanding of temporal things, for, although temporal things have a past, present, and future, with dates that are temporally related, the past, present, and future modes of time are not temporally related: they are eternally related. Temporal things have temporal relations. The modes of time are the conditions for temporal relations, and their own mutual relations are not temporal. Temporal things change as they pass through the temporal modes, and thus the content of the past, present, and future changes with temporal passage. But the modal reality of past, present, and future does not change.

The neglect of the eternal togetherness of the temporal modes leads to a reduction of the modes to present time. This is the "being as presence" that so piqued Heidegger, although he could not think his way to eternity as a proper resolution of the difficulty. Process philosophy in Whitehead and Hartshorne, too, comes down to the view that only the present is real, that the past is gone and the future not yet. Of course the past is no longer present and the future is not present yet; or, better put, the things that were present are now past and the things still future have not become present. But without acknowledging that the past is real as past and the future is real as future, it is difficult to acknowledge moral identity over time: past actions are not real if you can forget them in the present, and the future is real only as anticipated. Thus there can be no serious guilt, nor serious commitment, nor cumulative moral identity except that expressed in present behavior. History too would be only a dream save for its present traces. And religious destiny can be given only the most shallow interpretation if it is reduced to present trends and anticipations. Popular consumerism is frequently condemned by philosophers for its obsession with present feelings; but much modern philosophy provides the rationale for the superficiality of present time consciousness, and popular culture is only now catching up.

As for religion, if the present alone is real, and the present is defined as presence in experience or presence to consciousness, then the divine is reduced to what can be contained within experience itself. Schleiermacher began more than he knew when he attempted to ground religious symbols and theology in a feeling of absolute dependence, that is, in a feeling. But for Schleiermacher, what human beings feel themselves absolutely dependent upon is far vaster than anything that can be contained

within *present* experience. In fact, for him, we experience that which transcends presence, that upon which present existence itself is dependent. More recently, the feeling of absolute dependence has been given an anthropological rather than a theological spin, and there is little sense that religious fulfillment could be anything other than an improvement of present experience. But classically and, I shall argue, truly and profoundly, religious fulfillment includes the attainment of a perspective more encompassing than that of present time, or even of finite human individuality. This is an accurate claim, I believe, not only for the West Asian religions that thematize the "vision of God" but also for the South Asian religions that thematize "enlightenment" and the East Asian religions with their emphasis on attunement and harmony. God, Brahman, Emptiness, the Dao—these are all more than temporal things. They are not whole in a present time, nor reducible to all times as present. Indeed, their apprehension, attainment, or realization requires, not their being fitted into the forms of finite human consciousness, but rather the transformation of the ordinary temporal consciousness into something else. That transformation of ordinary consciousness is a task of spiritual formation. So, a very important task for present spiritual formation is the development of symbols that can transform the soul so as to enable it to engage eternity.<sup>8</sup>

The main problem with engaging eternity for late modern people in North Atlantic cultures is that our souls are badly shaped for it. Because of our temporal preoccupations, and the scientistic culture's anti-religious dismissals of the problematic of eternity, the secondary referents to our cultural readiness do not allow very effective primary referents. Because of our over-temporalized souls, the secondary referents engaging us are compatible only with degenerate primary referents such as eternity-as-space, eternity-as-static-form, or eternity-as-presence-to-consciousness. For us to engage eternity more effectively, it is necessary to find symbols with far better referents. This requires that we change our souls for secondary reference as well as aim at eternity itself more accurately. All this is a complicated way of making the old point that spiritual formation is needed in order to be able to experience or engage some things well. At immature levels of spiritual development, we get it wrong, seem to engage silly things, and set ourselves up for embarrassing symbols, especially when literalized.

To our unprepared minds, the classic symbols seem like immature versions of something else.

### III. Eternity in Plotinus

Neoplatonism has at least two principal contributions to make to this point. First, it provides a set of symbols whose primary referents are to aspects of eternity more subtle than usually get expressed by the modern terms. Second, and more interesting for the point, Neoplatonism offers an understanding of the transformation of the soul necessary for better engagement with eternity, namely, its interpretation of soul as the flight of the alone to the alone. I shall briefly deal with the former point, and more extensively with the latter.

In its most general and popular expression, for Plotinus and those influenced by him, eternity is connected with time as source to manifestation. Temporal process is seen as not original or *sui generis* but as the product or effect of something else that is not temporal, and that source is eternal in respect to time. In general, Neoplatonism shares with the creation *ex nihilo* tradition the claim that the temporal order is dependent on a more original, non-temporal or eternal reality. The niceties of the distinctions between Neoplatonic emanation and *ex nihilo* creation need not occupy us here.<sup>9</sup> Suffice it to say that both construe eternity and time together as one topic, that the togetherness is causal in some sense, and that the entire matter is ontological, having to do with the nature of being, not just of what happens within the temporal cosmos.<sup>10</sup>

Plotinus' own analysis is in the seventh tractate of the third *en*nead.<sup>11</sup> He begins, in section 1, with the hypothesis that eternity and time are two different things, distinguished in the Platonic way (according to him) as exemplar or kind relative to its Image. On this hypothesis, if we knew eternity as the exemplar, we would then be able to know time as its Image; or because we know time as movement, we can know eternity as that of which time is the moving Image. Plotinus then asks, in section 2, what we can understand about eternity as a kind or exemplar. He considers and rejects several hypotheses in this regard, finding some truth in each but also dialectical contradictions. In subsequent sections he develops his positive hypothesis about eternity which is defined in

reference to time. Eternity is the repose of soul in its infinite completeness. It contains time within it as a potential, but not as actually following out the sequence of moments. Time itself is soul as infinitely differentiating, moving sequentially in an even or uniform fashion from future to future. Temporal soul is actually infinite in its sequence potential; that is, time by nature will unfold infinitely; but temporal Soul, and all temporal souls, always face a future and therefore at no time have ever run through an actual infinite. By the same token, no temporal soul is ever wholly actual at any one time, nor is the temporal world ever at a time wholly actual. Eternity, for Plotinus, is the supreme reality, which has the character of soul, and that enjoys fulness of being without ever having to move from future potential to present actuality. Time is the image of eternity in that it is infinite and perpetual movement imitating the fullness of eternal being which is in repose. Plotinus spells out the causal relation between eternity's infinite repose and time's infinite movement in the following passage, worth quoting at length.

Time at first—in reality before that “first” was produced by desire of succession—Time lay, self-concentrated, at rest with the Authentic Existent: it was not yet Time; it was merged in the Authentic and motionless with it. But there was an active principle there, one set on governing itself and realizing itself [=the All-Soul], and it chose to aim at something more than its present: it stirred from its rest, and Time stirred with it. And we, stirring to a ceaseless succession, to a next, to the discrimination of identity and the establishment of ever-new difference, traversed a portion of the out-going path and produced an image of Eternity, produced Time.

For the Soul contained an unquiet faculty, always desirous of translating elsewhere what it saw in the Authentic Realm, and it could not bear to retain within itself all the dense fullness of its possession.

A Seed is at rest; the nature-principle within, uncoiling outwards, makes way towards what seems to it a large life; but by that partition it loses; it was a unity self-gathered, and now, in going forth from itself, it fritters its unity away: it advances in a weaker greatness. It is so with this faculty of the Soul, which it produced the Kosmos known to sense—the mimic of the Divine Sphere, moving not in the very movement of the Divine but in its similitude, in an effort to reproduce that of the Divine. To bring this Kosmos into being, the Soul first laid aside its eternity and clothed itself with Time; this world of its fashioning it then gave over to be a servant to Time, making it at every

point a thing of Time, setting all its progressions within the bourns of Time. For the Kosmos moves only in Soul—the only Space within the range of the All open to it to move in—and therefore its Movement has always been in the Time which inheres in Soul.

Putting forth its energy in act after act, in a constant progress of novelty, the Soul produces succession as well as act; taking up new purposes added to the old it brings thus into being what had not existed in that former period when its purpose was still dormant and its life was not as it since became: the life is changed and that change carries with it a change of Time. Time, then, is contained in differentiation of Life; the ceaseless forward movement of Life brings with it unending Time; and Life as it achieves its stages constitutes past Time....

Eternity, we have said, is Life in Repose, unchanging, self-identical, always complete; and there is to be an image of Eternity—Time—such an image as this lower All presents of the Higher Sphere. Therefore over against that higher life there must be another life, known by the same name as the more veritable life of the Soul; over against that movement of the Intellectual Soul there must be the movement of some partial phase; over against that identity, unchangeableness and stability there must be that which is not constant in the one hold but puts forth multitudinous acts over against that oneness without extent or interval; there must be an image of oneness, a unity of link and succession; over against the immediately infinite and all-comprehending, that which tends, yes, to infinity but by tending to a perpetual futurity; over against the Whole in concentration, there must be that which is to be a Whole by stages never final. The lesser must always be working toward the increase of its Being, this will be its imitation of what is immediately complete, self-realized, endless without stage: only thus can its Being reproduce that of the Higher.<sup>12</sup>

In one important respect, Plotinus' view of the relation between eternity and time is implausible to the modern mind, namely, in its easy use of the anthropomorphic language of desire for the eternal. In our time, the supposition is that desire, almost by definition, means a longing for what is not yet and therefore the desirer needs to be temporal. Most theologians, for instance, who maintain what they take to be divine purpose, argue that God is radically temporal. Process theology is an obvious case in point.

Let me therefore set aside, at least temporarily, the language of desire and focus rather the more general point in Plotinus' account of eternity and time, namely, that eternity is life in its fullness and temporal existence is life striving after an infinite fulness it cannot comprehend in any finite sequence of moments.

There is a defensible contemporary way of putting this. Suppose that time and its temporal modes of past, present, and future are not containers of temporal things but characteristics of temporal things; Plotinus and Whitehead would agree with this point over against Newton and Einstein. On these suppositions, the temporal order thus includes every dateable thing in each of its states in all of its temporal modes. Obviously, each thing is included in its state of dateable present realization or happening; but it is also included as a far distant unimaginable possibility, as a remote possibility, as a proximate possibility, and as a virtually imminent nearly immediate future.

More exactly, in the temporal order, each dateable thing is included in all its shifts of future structure, each shift occasioned in the temporal order by some antecedent present decision affecting the future. As contained within the temporal order each thing's future is an immense array of continuously shifting possibility structures. The past is what is fixed, achieved, and definite. But each thing's past states in the temporal order accrue meaning as more things happen, and this meaning shifts as continuously with the passage of time as the shifts in its future states. So the things whose date is June 12, 1995, had one structure in the year 5, another in the year 1005, another on June 12, 1994, another on June 11, 1995; those things have a decisive presence on June 12, 1995, and having occurred will have one meaning on June 13, 1995, another on June 12, 1996, another in 2995, and another in 3995. All those states of all dateable things are contained within the temporal order, all together, though obviously not all at the same time.

The temporal order itself is eternal, not temporal. Temporal things, things within time, are temporal, and their dates are related to one another as past, present, and future. But the togetherness of past, present, and future is not temporal. And the togetherness of all the temporal moments of a dateable thing's reality is eternal, not temporal. The temporality of a dateable thing consists in its relations to other things as relative to its past, present, and future. The dynamism of the temporal order springs from the shifting date of the present. But the dynamism of the eternal quality of the temporal order includes not only the changes that take place in present happenings but all the shifts made in future possibilities and accrued actual meanings occasioned by decisive happenings.

I have argued at length that the only way by which temporally distinct things can be together in such a way as to be temporally related is by being created together *ex nihilo*.<sup>13</sup> Plotinus would prefer emanation to creation language; although there are serious differences, they are not relevant to the present point. The creative act is eternal and has as its end product the temporal order which is also eternal in the sense explained. Therefore, I would say, in accord with Plotinus, that the creating of the temporal order is a vast eternal life, fully dynamic as containing all dateable things in all their temporal modes and as in constant dynamic shifting. This is life in the fullest sense. Divine life contains the whole temporal order, not at once but in completeness, including all things in all their shifts of future, present, and past characters, all as connected together in ways as determined by those shifting characters. Whereas the life of a temporal being has a kind of external relation to elements of its future and past, focused in present existence, the life of eternity encompasses all that, at no time, and in fulness. In theistic language, the divine eternal life, creating the whole of the temporal order, is infinite in its dynamism and creativity, and this is imitated at a distance by finite lives that are dynamic successively, moment by moment.

#### IV. The Formation of Souls to Grasp Eternity

Interesting as the metaphysics of eternity might be to some, especially to Neoplatonists and conversely to anti-eternalists such as Process philosophers, my purpose here is not to address the notional dialectic but rather the spiritual capacities of modern people to engage the eternal dimensions of reality. The metaphysical dialectic itself is a powerful symbolism for engaging eternity, and it is effectively influential in my own case to a high degree. But let me recall the problem of spiritual formation: it is to transform the soul so that symbols of divine eternity such as those Neoplatonic ones I have just discussed can be used to engage the divine, rather than degenerate symbols of eternity representing it as space or static form or presence to the mind's eye. The doubled reference of symbols requires the state of soul in the secondary referent to be appropriate for the reality in the primary referent as determined by the symbol. The state of soul of most modern people

is so temporalized as to preclude deep engagement of reality with symbols of divine eternity. Temporalistic philosophers might follow the dialectic of Plotinus' or my symbols of divine eternity, and might even agree notionally; but they would not engage reality with those symbols, and hence cannot experientially test them, without a transformation of soul.

The transformation of soul required involves a transformation of the sense of personal location or perspective-point that includes more than the present. A person must have some kind of self-identification with at least some past and future dates as being equally real and determinative of the self as the affairs and states of the present. The experiential break-through comes in appreciating the eternal divine life as a real dynamic togetherness of temporally distinct things. This can hardly happen until the sense of personal self is expanded to include together the young self whose life is still mainly future opportunities, the middle-aged person whose life is defined mainly by responsibilities bound by the past and binding the future, and the old person whose life is mainly past deeds the ongoing meaning of which is slipping out of one's control. The personal standpoint required is one that experiences the world not just from some present date but from a sense of personal location that includes all the person's dates in all their states of future, past, and present temporality.

Of course, we can get these senses of the eternal identity of our temporal lives only fleetingly, and often through many levels of symbolic direction. As Aristotle said, one swallow does not make a summer. If we were continuously absorbed in a full-life sense of personal location, it would be disastrous to drive a car. Moreover, the intensity of present experience would be dissipated and hence the interesting character of finite freedom would be diminished. Finite life would be greatly impoverished by a continuous substitution of the perspective of our eternal identity for today's identity. At best, we should strive for a kind of bifocal vision, with the capacity to see in eternity always coupled with the capacity to see from within time where the finite action is. Plotinus might not be as happy with this defense of the special importance of the finite as an incarnationalist Christian such as myself is. But in our time, the problem is not serious. Our problem is to find a sparrow or two. To develop even fleeting glimpses of a self-identity inclusive of all the temporal modes, and from thence to glimpse the eternity of the world and the divine life, would be a great achievement.

The Neoplatonic contribution to the spiritual process of reading oneself to engage eternity is important to recover.<sup>14</sup> Recall its bare outlines. We finite temporal souls need to learn to identify with the world Soul. And then in a flight of transformative symbolization come to feel the repose of the world Soul through the Nous in the One. Plotinus and his tradition, coming in this instance from Plato, is clear that the flight of the soul is not a movement from one object to another, nor a learning of first one subject and then another. Rather, it is a transformation of the soul's own nature to attain to engaged appreciation of its true eternal reality in the World Soul, Nous, and the One. In the final vision, there is only one thing, God or the One, and in that are all other things in true eternal perspective.

Now the next topic, or the completion of this one, would be a discussion of practical techniques of spiritual formation that might effect the requisite transformation of soul. Fundamentally, these techniques are ways of enlarging the imagination so that the data of life are synthesized in images that include a personal sense of eternal location.<sup>15</sup> The enlargement of the imagination comes through habituating it through symbol systems whose meanings involve a reconstitution of the sense of self in the secondary referents, step by step. The secondary reference of a symbol or symbol system needs to make contact with the sense of self, but also to nudge it to more nearly eternal proportions. The language of "ascent" has been important in the Neoplatonic tradition, moving upward to higher and higher ways of engaging the world through ever more nearly eternal symbol systems. Bonaventure's *Mind's Road to God* is a classic example. In our time, Tillich has inverted the metaphor of the path to depths, not heights. Other traditions have other metaphors for the path of moving from one symbol system for engaging reality to another, approaching a properly eternal standpoint. Daoists like to cast aside the conventional for the purely natural. Tibetan Buddhists conceive excessive temporality as a kind of selfishness that can be scared away by fierce goddesses. Advaita Vedantins take the path to be a lifetime of study of commentaries on ritual.

Philosophers are likely to view the path toward spiritual readiness to engage eternity to be a matter of dialectic. Surely Neoplatonism has often been comfortable with this, and it is indeed powerful. But the far richer symbol systems of religious communities are also helpful and perhaps far more efficacious for

the practical purposes of transforming the imagination. Jesus' parable (Matthew 22: 1-14) of the king who invites people to his son's wedding banquet, and casts the improperly dressed guest into the outer darkness, is surely as "decentering" as any Tibetan goddess. The visualization practices of Ignatian spirituality and the hymns of Charles Wesley are far more helpful to most people than Plotinus's or my philosophical dialectic.

In this paper I have attempted to consider Neoplatonism within the specifically religious context of the engagement of eternity. This has involved the making of a few points about the complexities of religious symbols and what they do, and also about the present state of culture regarding the capacity to engage eternity effectively. Both of these tasks rest upon the resolution of issues about symbolism and the truth of claims about the reality of eternity that I have not attempted here, although I have addressed them elsewhere. What this paper means principally to affirm about Neoplatonism is its claim that the soul finds important fulfillment in transforming its merely temporal character so as to be able to engage the eternity of the divine life. The practical religious means to accomplish this in the late modern world is central to our religious culture.

#### NOTES

1. See, for instance, Tillich's *Dynamics of Faith* (New York: Harper, 1957), or his *Systematic Theology*, vol. 1 (Chicago: University of Chicago Press, 1951), pp. 239 ff.
2. These introductory points are spelled out in much greater detail in my *The Truth of Broken Symbols* (Albany: State University of New York Press, 1995).
3. Peirce's theory of signs is developed throughout his work. See especially the *Collected Papers*, vol. 5, edited by Charles Hartshorne and Paul Weiss (Cambridge: Harvard University Press, 1935), 5.283-317. For a good general account, see Vincent Colapietro's *Peirce's Approach to the Self: A Semiotic Perspective on Human Subjectivity* (Albany: State University of New York Press, 1989).
4. Peirce himself restricted the word *symbol* to a certain kind of signs, namely a conventional sign to be distinguished from iconic signs and indexical signs. Religious symbols have all those elements, conventional, iconic, and indexical, and I shall follow the customary

- use in calling all those religious signs *symbols*.
5. The notion of a finite/infinite contrast is developed at length in *The Truth of Broken Symbols*.
6. For a fine historical study see Richard Sorabji's *Time, Creation, and the Continuum* (Ithaca: Cornell University Press, 1983).
7. Interestingly, Leibniz took an interest in Descartes' theory of creation in order to disagree with him sharply. For citations of the relevant texts and an analysis of their arguments, see my "Some Historical Problems about the Transcendence of God," *Journal of Religion*, 47 (January 1967), 1-9.
8. This analysis of the philosophical and religious dimensions of time and eternity summarizes portions of my book, *Eternity and Time's Flow* (Albany: State University of New York Press, 1993).
9. The distinctions are dealt with at length in my *God the Creator* (Albany: State University of New York Press, 1992; original edition Chicago University Press, 1968), chapter 3, where I defend a version of creation *ex nihilo*.
10. That time and eternity constitute one topic was pointed out most felicitously by Peter Manchester in his "The Religious Experience of Time and Eternity," in *Classical Mediterranean Spirituality*, edited by A.H. Armstrong (New York: Crossroad, 1986), p. 384. His whole essay is very helpful for the topic of this section. But he illustrates the point made in the previous section about our obsession with time when he calls "the name for this single embracing topic...temporality." If the point about causal dependence of temporal process on eternity is understood, the name ought to be something like "emanation" or "creation *ex nihilo*."
11. I follow the McKenna edition and translation.
12. Ennead Three, VII, 11.
13. In *Eternity and Time's Flow*.
14. See Pierre Hadot's excellent review article, "Neoplatonist Spirituality: Plotinus and Porphyry" in Armstrong, pp. 230-249.
15. My *Reconstruction of Thinking*, Part 2, (Albany: State University of New York Press, 1981), analyzes the role of synthesizing imagination as constitutive of personal identity. The project, of course, is a development of Kant's approach to imagination in the A Deduction of the *Critique of Pure Reason*.

# **No-Thing or nothing: Mysticism and Neoplatonism in Neville's Conception of God**

**Charles G. Woods**

Robert C. Neville's metaphysics and conception of God is one of the most original and trenchant of the twentieth century. Langdon Glikley<sup>1</sup> has called Neville "possibly the greatest metaphysician of the North American continent." His conception of God is worked out primarily in three works, *God the Creator*, (his magnum opus) *Behind the Masks of God*, and quite recently in, *A Theology Primer*. He is also the author of many other works that touch upon the problem of God, but these three works are central. This paper will discuss Neville's conception of God as "Creator" or "Ground" of the world as based on a reading of these three central texts, as well as some "readings-in" his other works. It's understanding has also been based on letters and personal conversations between the author and Professor Neville over the last fifteen years, as well as numerous conversations with Professor Harley Chapman, a long time student of Neville's philosophy.

Neville's writings, of course, will take precedence over these other sources, however, the author has persistently questioned Neville on the nature of the "nothingness" of God and of the relationship of this nothingness to mysticism, Neoplatonic philosophy and to the problem of pantheism, all problems that will be touched upon in this paper. This paper will attempt to *unpack* or (non-ideologically) "deconstruct" Neville's conception of God.

Although Neville's thought is both profound, delicately nuanced and appreciated in the scholarly community, it has still not caught fire *culturally*, such as Heidegger's or Tillich's did. This is possibly true for a few reasons. Neville's thought can be quite abstract (even his work meant for the general public) though more successful recently. He has not until recently had doctoral students writing theses on his work. And lastly, his work is difficult to

situate within a "Tradition". Neville is seen most often in opposition to process thinkers, or as a strange bed fellow with Thomists of various stripes. He can also be seen as "too religious" for naturalistic thinkers, or "too naturalistic" and "rationalistic" (or not enough!) for some religious thinkers.

In addition, although doing good work in comparative philosophy of religion in regard to his metaphysics, he mentions more often (and seems to know better) Eastern, especially Chinese mystics to Western and Neoplatonic/Christian ones. This is true though he himself is, (at least recently) a "Christian Theologian." As a cosmologist he is more easily associated and understood with Dewey, Peirce, Weiss, or Whitehead than with *strongly* Christian thinkers.

This paper will consist of four parts: *Part I* will outline Neville's conception of God and give a summary of his detailed Creation ex nihilo arguments. *Part II* will try to situate him within a Tradition which is, in part, surprisingly Neoplatonic. *Part III* will criticize his conception of God for "mystical" (not religious) availability, and *Part IV*, the Conclusion, will attempt a slight readjustment in his conception of God as "nothing" into a Mystical No-thingness, resolving the criticisms made in *Part III*.

## I

Being in large agreement with many of Neville's complex arguments in *God the Creator*, this paper will directly discuss the "nature" of God's "nothingness." Neville's simplest summary of his argument for God the Creator is possibly in his work *Behind the Masks of God* titled "The Logic of Creation Ex Nihilo." The summary follows, then it be will commented on and fleshed it out as it were.

- "1. Creation ex nihilo is a three term relation of world, act, and ground.
2. Everything determinate is part of the world and needs an ontological ground.
3. The act of creation is eternal, strictly speaking.
4. In itself the ground is nothing; its character as ground is a condition resulting from creation.

5. The question of theism or non-theism is a secondary issue, depending on different interpretations of the world and perhaps genuinely different experiences.
6. The ontological ground cannot be an object of knowledge, but can be known through the conditional role involved in the creation relation.
7. Non-being or emptiness is pervasive of all ontological contingency, including the contingency of the ground itself.
8. By virtue of being in harmony, every determinate thing, every creature bears a value of a certain kind and degree."

Attention should be drawn to Neville's point number four; "In itself the ground is *nothing*" [emphasis mine] and number six, "The ontological ground *cannot* be an object of *knowledge*." [Emphasis mine.]

In his great early work, *God the Creator*, Neville uses the language of "transcendence" and "indeterminateness" more than "nothingness," for instance, "The creator...is transcendent and indeterminate." Also in *A Theology Primer*, he writes, "Nor can we say, apart from creation, that God is knowing, good, powerful, or any of the other things there has been reason to say of God from a religious perspective. Apart from creation, God is indistinguishable from *nothing*." [Emphasis mine.]

Similar and almost identical quotes could be culled from all his works. For Neville, God apart from creation is *nothing* and therefore is *not* knowable—Deus Absconditus! This is the "logical *nothing*" in Neville's system—everything that exists is determinate; all determinations need to be created—the Creator cannot, therefore, be another determination. (This answers or stops the child's question—"But who made God?") If the creator is indeterminate, he cannot therefore be distinguished from "nothing." We will not question Neville's reasonings here, (though they have been questioned), for we are in large agreement with them by our own similar arguments and by temperament.

But why question the mystical availability of Neville's conception of God as "nothing"—for have not many mystics of both East and West spoken of God as "nothing"? Neville in fact states in his *Behind the Masks of God* that if "The creator is *indeterminate* apart from creation and determinate precisely as Creator, a great gain will be had; for we will have reconciled theism and God

beyond God *mysticism*.” [Italics mine.] He says in two connected paragraphs, “God is indistinguishable from *nothing*” and “As the *mystics* have *known*, in the transcendence of the *spirit*, God *appears* finally as the *Nothing*.” [Italics mine.] He also writes, “Yet Christian mystics have *known* that the deeper reality of God is *the abyss of Nothingness*.” [Italics mine.]

When Neville writes as a metaphysician, he writes of God-in-Himself as “nothing” with a small ‘n’ and states that (#6) “The ontological ground [God] *cannot* be an object of *knowledge*.” [Italics mine.] But when he writes of mystics, (or as a mystic?) he uses a capital ‘N’. Which is it? If Neville were to state that his mysticism is in logical conflict with his philosophy or that this No-thingness is a “paradox”, then we would not question him. But this contradiction is glaring in a thinker that dislikes them. We will return to this problem in Parts III and IV.

## II

As was stated in the ‘Introduction,’ Neville’s philosophy is difficult to situate within a Tradition—no doubt this is in part due to the truly creative aspects of his philosophy. But even Derrida has been seen as a continuation and development of Nietzsche and Heidegger.

Cosmologically, however, Neville is not so difficult to locate. Whitehead, Dewey, and Peirce help us sufficiently and in certain aspects of general metaphysics, Weiss and many others are helpful. But as a “Christian” philosopher with a view of God as Creator, he is difficult to locate. His own hints at a Tradition are not even that helpful. In *God the Creator*, he describes his position as “Platonic-Augustinian.”

He also places himself in the wide stream of “speculative philosophy”<sup>10</sup> that include, “Origen, Augustine, Anselm, Bonaventure, Schleiermacher, Tillich, and countless others.”<sup>11</sup> This is, no doubt, true but we believe that Duns Scotus is the ‘primary’ source for Neville as a Christian philosopher, for he also stated in *A Theology Primer* that when he was “in graduate school attempting to write a dissertation on Dun Scotus’ theory of divine creation, one evening [that he] suddenly understood the logic of the causal

asymmetry represented by the idea of creation ex nihilo.”<sup>12</sup> [Emphasis mine.]

The problem starts already with Neville placing himself in the Platonic-Augustinian tradition. We understand why he said this, for he is a Platonist in the sense that he has Eternal Ideas in his philosophy. Also, the idea of a “mixture” in Plato’s *Philebus* becomes important for Neville’s cosmology. Since his view of determinate being as a mixture of essential and conditional aspects which creates a “harmony” of certain kinds and degrees can be seen as “platonic”. It can also be seen why he states he is an Augustinian in that Augustine was the greatest founder in the West of the conception of God as Creator, and Augustine, no doubt, was also something of a Platonist.

But the similarities end there, for Plato and most Platonists God does *not* “create” the world but “forms” or emanates it. And although Augustine’s God *does* create the world, He does *not* create the ‘Intelligible world,’ the world of Ideas which under Albinus’ (and in part Plotinus’ influence) Augustine placed in God’s Mind. It was up to Aquinas to unify this multiplicity of the Divine Ideas. This is *radically* different, however, from Neville’s conception of God as Creator. For in Neville’s conception, although God *does* create the universe, He does so not from Ideas, or Archetypes, or aspects of His Divine Mind, for He *also* “creates” the Divine Ideas. This is one prong of Neville’s great originality. Neville distances himself from these Platonic thinkers, for he says in his *Behind the Masks of God* that, “God has been thought by Platonists and Neo-platonists to create the whole cosmos, but not the intelligibles or divine ideas, or divine nature.” He also rightly distances himself from forms of Whiteheadian panentheism. We believe, however, that opposites at times do coincide *a la* Cusa and that Neville *is*, in fact, closer to some extreme Neoplatonists than he recognizes and we will return to these mystical thinkers later in this section and again in Parts III and IV.

Now, we return to Duns Scotus who obviously did influence Neville. Scotus is usually seen as continuing the Augustinian tradition and maybe that is the continuity Neville finds in his “Augustinian” tradition. However, Scotus was only marginally an Augustinian, for he was very influenced by Aristotle and Thomas and was a truly original metaphysician—still influencing thinkers such as Peirce and Heidegger even recently. The “Subtle Doctor”

(whom Neville can be seen as a modern image of in his own abstract subtleties!) is only marginally and residually an Augustinian. Scotus was like a "third party" political member still loyally clinging to being a Republican or a Democrat.

Duns Scotus reduced the positive Ideas of Augustine to "logical possibilities" (much like in Whitehead's system.) He eliminated the Illumination theory of knowledge of Augustine, (as Thomas largely did) Bonaventure, and Grosseteste (and later, Malebranche.) Scotus is therefore, only an Augustinian in that his God is a Creator and that he seems to allow a hazy "intuition of Being" (if we understand him properly), and also in his emphasis on Will and Love over Intellect.

What Scotus influenced Neville with, though, was his unique (and hardly Augustinian) theory of the "univocal" predication of "Being", (with which the author is also in harmony) and the radical asymmetry between the world and God. This absolute dependence of the world on God, Neville could have taken from any of the great theists, such as Augustine, Bonaventure, or Aquinas, but it was Scotus' philosophy that triggered a deep and profound intuition in him "that has been [his] topic ever since."<sup>13</sup> Scotus as the source of Neville's conception of God as "Creator" should probably weigh in the balance equally with Whitehead, Peirce, Dewey, and Weiss combined! All of Neville's ideas of God are echoes of an intuitive explosion derived from Scotus in graduate school, and by the later Neo-Scotist Peirce. Having said this much, it may surprise everyone that the author does *not* think Scotus' theory of God is closest to Neville's theory in historical fact! For in *different* ways, as regarding God or Creation, three other thinkers are possibly closer in spirit to Neville's thought. For one, another Scotus is paradoxically closer in *some ways* to *Neville's thought*. This thinker is John Scotus Eriugena, the great ninth century heterodox Christian Neoplatonist. And secondly, another late Augustinian, William Ockham, the great Father of Nominalism and an Augustinian anti-platonist (he was an anti-Augustinian Augustinian!) And finally, the founder of modern philosophy—Rene Descartes, is, we believe, closer to Neville's conception of God and creation than even Scotus is.

To explain why we picked these three thinkers, there is a need to step back and discuss Neville and Duns Scotus a moment longer. With Scotus, God creates the world from logical possibilities (there

are scholarly controversies on this though), and it is with God's choice of these "possibilities" that He *Wills* the divine creation." To Neville, these "possibilities" must have seemed less "determinate" than Augustine's, Bonaventure's or even Aquinas' understanding of Divine Ideas. Neville must have thought Scotus' philosophy of the Logos to be a half-way house and he out subtled The Subtle Doctor by eliminating even these possibles. One would think this made God a pure Potentiality, like the later Cusas' Divine Posse. But one would be wrong again. To Neville, God-in-Himself is *not—or* before, temporarily (or logically?) the world. The Creator is "nothing": *not* the Divine Ideas, *not* the Divine Simplicity, *not* the Divine Possibilities, *nor* even pure Divine Potentiality; Nothing. Even this "nothing" is not a "mystical" nothing as in Tillich. This will be discussed in Part III.

Why then is Eriugena, Ockham and Descartes possibly closer to Neville than Scotus? Starting with Eriugena: Eriugena, following the late Neoplatonist Proclus through Pseudo-Dionysius, stated that God *Creates* the Divine Idea—the Logos. The Word, the Divine Idea(s) are *not* in God's mind as in Augustine. God as Unknowable *creates* the Logos and He is the first in the West to call God "Nihil" or Nothing. Eriugena speaks of Nature as having four great aspects:

1. That which is Uncreated and Creates—God as Nothing—which Creates the Logos.
2. That which is Created and Creates—the Logos—God as *Creator* of the world.
3. That which is created and does not create—the world which is *not* God but which Eriugena says is a "Theophany" or "Appearance of God."
4. That which neither creates nor is created—God again "in-Himself."

There are some obvious parallels here to Neville's profound philosophical system.

First, in Eriugena, God as Father (Ground) *creates* the divine Logos. This creation is Eternal in Eriugena and is distinguished from the temporal creation of the world. Eriugena may be the first to speak of a "created logos." (Although since the creation of the logos is eternal and since Plotinus speaks of The One as Willing the

Intelligibles, Plotinus might beat both Eriugena and Neville to the punch).

Secondly, Eriugena was the first to call God "Nihil" or Nothing with a capital 'N'.

Neville speaks of "creation ex nihilo (as) a three term relation of world, act, and ground."<sup>16</sup> [Emphasis mine.]

For Neville, there are *three* parts or aspects of "Nature"—(to use Eriugena's term<sup>17</sup>)—Ground, Act and World. We suggest that Eriugena's *fourfold* system better fits the facts and even Neville's own system. For Neville states that God did not "have" to create the world and that outside of creating, He cannot even be understood as a Creator, or Ground. Or even as a *potentiality* as Neville says in his tightly argued early work, *God the Creator*. "The creative power of God can in *no* way be construed as a *potentiality* or *potency*."<sup>18</sup> [Italics mine.] If this is true, then God-in-himself as 'nothing' is *not* the same as God as "Ground". If Professor Neville would agree with this—then we can 'restructure' Neville's threefold system to Eriugena's fourfold one. Neville's doctrine of the Logos *is*, in fact, fourfold as—SkyGod, EarthMother, Ground and Goal, but we mean to restructure his "three" aspects of Ground, Act, and World. We will slightly restructure as such:

1. Eriugena's "that which is Uncreated and Creates" should be understood as Neville's God as Creator or Ground.
2. Eriugena's "that which is created and creates" (Eriugena's Logos) should be understood similarly as Neville's Act, or Logos. Neville's Logos does *not* create, though, as in Eriugena.
3. Eriugena's "that which is created and does not create" (Eriugena's temporal world) is also Neville's "world."
4. Here is the tricky part—Eriugena's "that which is neither created nor creates" (God-in-Himself or Eriugena's Nihil or nothingness)—should be understood as Neville's God-in-Himself or Nothing.

All things do not return to God in Neville, however. At first, it may not seem like much has been done, possibly more like a 'sleight-of-hand', but we don't think so. What Neville has done is to conflate Eriugena's first and fourth aspects of Nature. Why does Neville do this? (Is he being out-subtled by Eriugena?) This is not impossible—for Eriugena is quickly becoming recognized as the

greatest metaphysical thinker between Augustine and Anselm. Only Aquinas and Scotus equal him and even they did not create such a complete or compact magnum opus as Eriugena's *The Division of Nature*. Neville, however, probably did not miss this distinction. He is still "subtle" here. The difference between Eriugena and Neville, we suggest, is in the way they understand the "nothingness" of God. Eriugena's nothing is a Mystical No-thingness, a Divine Nothingness similar to Tillich's, or as in the Kabbalah. However, Neville's means his "nothing" to mean *nothing*! Depending on whether one is in a metaphysical or a mystical mood, either thinker is more correct. Neville is sticking to his metaphysics to the end. Eriugena could be seen as waffling. (He would have his answer though.)

In his *Behind the Masks of God*, Neville states in our previously quoted point six that "The ontological ground cannot be an object of knowledge." There and in his point four, he is valid logically—"In itself the ground is nothing."

We would then be satisfied "logically" (if not mystically) if he did not contradict himself so "un-subtly," then, as previously quoted in the same book as, "Yet Christian mystics have known that the deeper reality of God is the *Abyss of Nothingness*."<sup>19</sup> [Italics mine.] And also as previously quoted (in the *Primer*) "As the mystics have *known* in the *transcendence* of the spirit God *appears* finally as the *Nothing*."<sup>20</sup> [Italics mine.]

This is obviously both a big contradiction *and* also mystically un-satisfying. This, the core of this paper's thesis, will be addressed in Part III and given a suggested solution in Part IV. For now we would like to mention the great similarities of Ockham, and Descartes to Neville—in fact, even greater than Duns Scotus regarding "creation." William of Ockham: Duns Scotus' "logical possibilities" were still understood to be aspects of the Divine Simplicity; with Ockham, there are no Divine Ideas at all that God looks to, to create the world. God is *absolutely* omnipotent to Ockham. He is not limited by other attributes like Reason or Goodness. The old question of Plato and the medievals—Is something Good because God wills it or does God will it because it is Good?—Aquinas answers with the second.

Scotus with William of Ockham strongly asserts the first—something is Good because *and only* because God wills it! God could make water run uphill, make  $2 + 2 = 5$ , or make round-

squares. Although Neville does not emphasize such created anomalies, they are at least a "possible" interpretation of his conception of God as *Absolute* Ground—of all. There are, of course, major differences in other aspects of their philosophies, and Neville in particular is *no* nominalist or Fideist.

The last thinker we would like to discuss is Rene Descartes: Descartes was in large measure trying to combat the skepticism of the later nominalists. But he is similar to both Eriugena, Ockham, and Neville in the sense that for him, God *creates* the Divine Ideas. With Descartes, the Ideas are again Eternal (as they are with Eriugena and Neville). God *created* Truth, it is Eternal and unchanging— $2 + 2$  will always equal 4—for Eriugena and Descartes. Ockham is stranger, for he says that God's Will, His Thought, and His Act are one (which Spinoza, Moses Cordovero and others also said) but with Ockham, the emphasis is on the "Will," and he emphasizes the nonrelatedness of past, present and future much like his later fellow countryman and empiricist, David Hume, will do. With Ockham,  $2 + 2$  could equal 3 yesterday, 4 today, and 5 tomorrow, and all could be correct—based on God's Will! Where is Neville vis a vis all this? He sides with Eriugena and Descartes—that God's created Truth is Eternal, *and* with Ockham, that He *could* have changed it! He is probably more comfortable with "could have," than "Will tomorrow," though.

Spinoza also, like Ockham, affirmed the identity of God's Will, Intellect, and Essence, and even said in one of his letters that the Muslim conception of God as absolute Potentate or Power was *closer* to the truth than a God who *looked* to patterns to Create ala the *Timaeus*. The difference between Spinoza and Ockham was that for Spinoza, God's decision (if there was one was final) with Ockham it might not be. Neville is somewhere in the middle. He would not be troubled by Spinoza's argument that *if* God had created a different universe, *then* his Intellect and Essence would have been different. For Neville consistently thinks we know God only *by* His Creation and even that He is a "Creator" *only* because He Creates. So for Neville, it probably would be true that *if* God created a different universe, *as* Creator, He *then would* have a different "Essence", *as* Creator. But what God is *in-Himself* aside from creating would *not* change for He is *not* an "Essence" at all—but "nothing."

We hope this alternate Tradition (weak though it is as a "Tradition"<sup>21</sup>) has proved helpful and that scholars of these philosophers may look into these associations more carefully<sup>22</sup>. We conclude this section by repeating that Duns Scotus should weigh equally with *all* other modern thinkers combined (with the exception of Tillich) in an understanding of Neville's "vertical causality," (concept of God and Creation) though not with his "horizontal (cosmological) causality."

### III

In this section, Neville's philosophy will be criticized for its "mystical availability"—something he somewhat inconsistently claims it has. Religious availability is not as much a problem.<sup>23</sup> Both Neville and the author have criticized Whitehead regarding religious availability, Neville in his book *Creativity and God*, and the author in his paper, "Whitehead's Conception of God."<sup>24</sup>

To state it baldly; Neville cannot say that God is *both* "nothing" and No-Thing. Again that God is both *unknowable* as "nothing" and that the mystics *know* this Nothingness!<sup>25</sup> Lewis Ford has pointed out to me that Neville may mean that the mystic "knows" that he does not know God. However, it *is* still an "experience". It must prove interesting to this great philosopher that, *only* mystics of East and West have spoken of God as Nothing—or in similar terms. And Neville, of course, does mention some of these thinkers, and mystics, i.e. Boehme and Eckhart.<sup>26</sup> Eriugena, for instance, speaks of God as a Divine Nothingness and even goes so far as to say that the "Nihil" that God Created the world from, is His *own* Nothingness—Creation Ex Nihilo—becomes, Creation Ex Deo! The Kabbalah also speaks of God as the "Ain" or "Ensof"—as Nothing or Infinite. Again, both Boehme and Eckhart call God "nothing", (or the Desert). The Buddhists speak of Sunyata, Nirvana, or No-mind, the Hindus of para-Brahman, etc. The point is that these are all obviously "mystical" philosophies and very likely based on some mystics 'experiences'—though the word "experience" is, no doubt, too dualistic.<sup>27</sup> John of the Cross also speaks of "Nada, Nada, Nada and on the mountain Nada." F.H. Bradley said "a person/appearance could not become the Absolute for then it would *be* The Absolute and no longer an individual." No doubt, this is also

Neville's correctly logical conclusion. "No one can look upon God's Face and live." But the great mystics say 'paradoxically' that they *do* die, *yet* live! The Buddhists's speak of "The Great Death" and "Nirvana" and the Sufi's of being annihilated in God—"Fana"—and also of being preserved—of "Baqa." Experiences of Divine Light are also often mentioned by the same writers that write of Nothingness as God. At times, as in St. Symeon The New Theologian (and many others) you find a phenomenological description (*if* we can use the term) of one grasping to define something that cannot be defined—"it's nothing"—"it's endless light." This light is then identified with Christ, Buddha, Allah, etc., depending upon the Tradition. Eric Voegelin,<sup>28</sup> for instance, thought Parmenides, the founder of Western metaphysics, in his *Poem* to the Goddess of Light to be describing a mystical experience of light. Terms like "infinite" to Voegelin are negations of finite experience (as in Spinoza's "all determination is in part negation".) Spinoza, for example, can also be seen as a mystical philosopher as W.T. Stace correctly pointed out.<sup>29</sup> This world is always an *experience* of "this or that," as Neville similarly states in *Behind the Masks of God*<sup>30</sup> "determinate identity is always *this* and *not that*." [Emphasis mine.] But the Hindu philosophers mystically also say that Brahman (or paraBrahman depending on the tradition) is "Neti Neti" "not this, not this." It is *not* this or that.

It is interesting that both the author and Neville have resonated with the language of Divine Nothingness, for both have had mystical experiences of Light.<sup>31</sup> It is possible that Neville's inexorable logic lead him to the black hole of God-in-Himself as "nothing," while His "mystical experience" of Light lead him to God as Nothingness. Neville is closer philosophically than he supposes, and much closer "experientially" to the Neoplatonic tradition, pagan and especially Christian. For God as Ground is very important to Neville. Maybe more important ultimately than God as Creator since God is not "personal" to Neville, and the created world, in a sense, is also Eternal. We believe he took the Word/Idea of "Ground" from Tillich, and Tillich got it by his own admission from the Pseudo-Dionysius, and unless Tillich read it in the original Greek, it is highly likely that he read it in Eriugena's Latin translation and gloss. Although Neville has, no doubt, read his Plotinus carefully as a metaphysician (though possibly not as a mystic), it seems evident from his (lack of) quotes that he does not

know the Neoplatonic tradition especially well. We believe that this is because he does not like the idea of "Hierarchy"—that God as the One emanates of necessity—the Nous, the World Soul, Nature, and possibly then Matter/evil. But many of the Eastern thinkers Neville studies *also have* Hierarchies and that is *not* the only way to read even Plotinus. You can easily read Plotinus "apophatically" as distinguishing between the Infinite/Indeterminate and the Finite/Determinate(s). Plotinus who is the source of many of the thinkers mentioned, also *all but* calls God "nothing." Additionally forgetting the World Soul for a moment; what is the difference between Plotinus' One (which is *not* 'a' Being) manifesting/emanating the Nous or Being, and Neville's God-in-Himself as Creator creating *timelessly* the logos? For Plotinus *does* speak of The One "Willing." Plotinus' One Emanates freely, or "freely/necessary" as in Spinoza and Schuon. What then is the difference of this from "Creation", since Neville admits that Creation ex nihilo is *not* intelligible in most common understandings of intelligibility<sup>32</sup>. Macquarrie points out that even in the Bible, metaphors of "emanation" are used side by side with more "creative" metaphors. If Neville wants a non-hierarchical version of Christian Neoplatonism, Nicolaus of Cusa should interest him, or Ibn Arabi the Iberian/Muslim, Neoplatonist/Sufi. For to these Neoplatonists, God *does* Create the World "directly" and not through "intermediaries," which is Neville's quite valid and main objection to one aspect of this "Tradition".

#### IV

We said in this conclusion that we would suggest minor changes in Neville's philosophy to better incorporate mystical experiences of the via negativa type, and one should remember that Dionysius said (and almost everyone forgets this!) that "God is dark through excess of light" like Aristotle's "owl in the sun." *Our reason* is blinded by God as Nothing but we suggest that Intellect (*not* "Ratio"), or Heart *can* Intuit—or "know" God in a *non-dualistic* way. Plotinus says the vision is not "other" and that "the vision baffles telling."<sup>33</sup>

Neville, in short, needs to make his nothing—Nothing—a Mystical Nothingness more like Tillich's. He should have nothing

to fear by this. He states it himself throughout his works without possibly unpacking it, and his metaphysics is *still* more coherent (if possibly less experientially passionate) than Tillich's. Professor Neville will, no doubt, wonder whether a Divine Nothing—making Creation Ex Deo will border then on pantheism? But *any* "participation" metaphysics already does.

We suggest that Neville, for one, distinguishes between "contradiction" and "Paradox" in his philosophy. A "contradiction" can be resolved—whereas greater knowledge only increases a "paradox". There are unsolved theorems, or "problems" *a la* Marcel that with greater knowledge may be solved. A mathematical example: a proof for Euclid's parallel lines is *possibly* a problem—but PI is probably a paradox (Marcel's "Mystery") of sorts.

With the highest/absolute mystical experience maybe there is a way that one can *know* without distinguishing subject and object, or by backing-into The Absolute, as it were.

Possibly the Divine Nothing *is* "pure experience," and yet not "determinate"—maybe Neville is wrong to equate nothingness *simply* with "indetermination". It is probable that this paper has raised more questions than it has answered, yet the questions are valid, and we hope that Professor Neville<sup>34</sup> will address these issues of Tradition, mysticism, Neoplatonism, and even 'pantheism' directly in his future and, no doubt, continuously excellent works.

But should we grasp the one of authentic beings, their principle, wellspring, and dynamis will we then lose faith and consider it *nothing*? It is certainly *nothing* of the things of which it is the origin, being such, as it were, that *nothing* can be attributed to it, neither *being*, nor beings, nor life. It is *beyond* those. If then by *withdrawing* being you should grasp it, you will be brought into *wonder*. [Emphasis mine.]

## PREFACE

R. Baine Harris

Although some twenty five scholars have been involved in its production, this book is primarily the result of the efforts of one person, the late Richard T. Wallis, of the Classics Department of the University of Oklahoma in Norman, Oklahoma. It was some time in the early spring of 1980 that I first suggested to him the idea of a major conference that would bring together authorities on Gnosticism and Neoplatonism from throughout the world for a serious discussion of the similarities, differences, and historical interrelation of the two. He readily accepted the challenge and spent most of his professional energy for the next four years of his life in making this possibility a reality.

Early along the way, he was able to enlist the support of Professor John Catlin, chairman of the Classics Department and Professor Kenneth Merrill, then chairman of the Department of Philosophy of the University of Oklahoma. Working together they were able to arrange adequate financial support from a number of sources, including a large grant from the University of Oklahoma and a major grant from the National Endowment for the Humanities. Due to their efforts, the Sixth International Conference of the International Society for Neoplatonic Studies was held in the University of Oklahoma, March 18-21, 1984, and the conference was a great success.

What sort of man was Richard T. Wallis, and what would cause him to give so much of his time and energy to what some would regard as an esoteric theme? A transplanted Englishman, he first came to the University of Oklahoma in August, 1970 to teach in the Department of Classics. The site was chosen partly for health reasons, since he had suffered for most of his adult life from a severe case of asthma, an

illness that eventually caused his death in 1985 at the early age of 43. His undergraduate education was in Trinity College, Cambridge, where he obtained his B.A. degree with First Class Honors in both parts of the Classical Tripos and as a result of his performance in Part II of the Tripos was awarded the Craven Research Studentship and Chancellor's Classical Medal.

His graduate training was in Churchill College, Cambridge, where he received both his M.A. and Ph.D. degrees, his dissertation for the latter being entitled "DIANOIA and PRONOIA from Plato to Plotinus." In addition to his regular teaching schedule during his fourteen year tenure at Oklahoma, he published eight articles and nineteen book reviews, mainly in *Classical Review* and *Classical World*, and in 1972 produced a major book entitled *Neoplatonism*. The latter was well received and an Italian translation of it was released in 1974. He was also invited to give special lectures in the University of California at Berkeley and the University of Manchester and was a charter member and served on the Advisory Committee of the International Society for Neoplatonic Studies, participating in its various international congresses.

About his willingness to focus upon the relationship between Neoplatonism and Gnosticism we can only speculate; but we can conjecture that he was quite aware of the fact that the differences between Neoplatonism and Gnosticism are of more than antiquarian interest. The Gnostic notion of salvation through individual special revelation apart from faith is still with us both inside and outside of the main established religious traditions of Christianity, Buddhism, Hinduism, and Islam. Some of the issues debated by the Third and Fourth Century Neoplatonists and Gnostics, namely, whether higher knowledge emerges from a foundation of reason or can occur apart from reason, whether nature and man can be regarded as a lower form of a higher reality and thus essentially good or must be taken to be essentially evil, and whether evil can or cannot be reconciled with divine providence are issues that still must be dealt with in any contemporary religious philosophy. As Wallis himself once wrote, "the debate between Plotinus and the Gnostics . . . involves movements that left a permanent mark on Christian theology, and thus on Western thought as a whole, while, more generally, it raises the perennial problems of reconciling evil with divine providence and of the perspective roles of reason and revelation in religion." (See p. 7 below.)

After his untimely death in April, 1985, the task of editing the conference papers, including arranging for translation of some of them, was assumed by one of the participants of the congress, Professor Jay

Bregman of the Department of History of the University of Maine at Orono, a task that required most of his time for most of a summer as well as additional time throughout the next year. He also continued and elaborated Wallis' unfinished introduction included in this volume.
